Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Getting the Most from the Index

THIS is essentially a subject index, not an index of titles, and articles treating a number of different subjects are listed under each of them. In addition, a geographical reference is published wherever the article relates to any particular railway company, city, state or nation. Entries about an electric railway are under the name of the city in which the main office of the company is located.

In the subject index, the alphabetical method is followed. If there is a choice of two or three keywords the one most generally used has been selected, cross references being supplied. The headings which appear in the index itself are in small type under the general classifications. The main headings in capitals below do not appear in the index.

As an example of how to use the index, if a reader wishes to locate an article on special trackwork he obviously would look in the list below at the general subject "Track." Under this caption, only "Special trackwork" could apply to the article in question.

The large number of articles brought out on the monthly maintenance data sheets, together with the increasing number of maintenance notes in other issues has resulted in the substitution of three keywords, for indexing items formerly appearing under "Repair shop practice": (1) Maintenance data, under which all articles appearing on the monthly maintenance data sheets are grouped; (2) Maintenance equipment, with classified subheads, under which all articles in the weekly department "New Equipment" are included, and (3) Maintenance practice, also with classified subheads, under which all articles in the weekly department "Maintenance Notes," as well as the articles on the data sheets, are inserted. The heading "Repair Shops and Equipment" has been reserved for general articles on the design of repair shops and their equipment. Otherwise the plan used for many years in the preparation of this index has been followed.

In addition to the groups of articles covered by these headings, papers and reports from railway associations are grouped under the names of the various organizations. Proceedings of other associations and societies are indexed in general only in accordance with the subject discussed.

Signed articles also are indexed by the name of the author. When the name of the author is known to the reader this provides the simplest method of locating any article.

CLASSIFIED LIST OF KEYWORDS

ACCIDENTS AND ACCIDENT PREVENTION
Accident claim department
Accident prevention
Accidents (including wrecks)
Insurance, Fire
Safety work
Storm and fire damage

ELECTRIC CARS AND SERVICE CARS
Cars (including car design)
Locomotives
Service and tower trucks
Trackless trolley

CAR EQUIPMENT
Bearings
Brakes and compressors
Doors, car
Electrical equipment for cars (except motors)
Gears and pinions
Heaters, electric
Lighting and lighting fixtures
Motors, Electric
Seats
Trucks
Wheels and axles

EMPLOYEES
Education
Employees
Insurance and pensions
Labor
Strikes and arbitrations
Wage decreases
Wage increases
Wages and working agreements

FARES
Fare collection (including apparatus)
Fare decreases
Fare increases
Fares
Traffic investigations
Traffic stimulation

FINANCIAL, LEGAL AND STATISTICS
Accounting
Appraisal of railway property
Blanks and forms
Discontinuance of lines
Financial (methods of financing)
Financial reports
Franchises
Insurance, Fire
Insurance and pensions
Legal
Legislation for railways
Market conditions
Operating records and costs
Public service and regulative commissions
Statistics
Taxes

HEAVY ELECTRIC TRACTION
Heavy electric traction (general)
Locomotives

MAINTENANCE OF EQUIPMENT
Car cleaning
Lubrication
Maintenance data
Maintenance equipment
Maintenance practice
Maintenance tools, Suggestions for
Motor buses, Operating practice
Painting
Repair shops and equipment
Stores
Tests of materials and equipment
Welding

MOTOR BUSES
Motor buses, design
Motor buses, gas-electric
Motor buses, installations
Motor buses, jitney competition
Motor buses, Operating practice
Motor buses, regulation

POWER
Energy checking devices
Energy consumption
Fuels

POWER—Continued
Overhead contact system
Power distribution
Power generation
Power stations and equipment
Power transmission
Substations and equipment

STRUCTURES
Bridges
Carhouses and storage yards
Loading platforms
Power stations and equipment
Repair shops and equipment
Substations and equipment
Terminals and waiting stations

TRACK
Pavements
Rail joints and bonds
Rails
Special trackwork
Ties
Track construction
Track maintenance

TRAFFIC AND TRANSPORTATION
Advertising
Dispatching
Freight and express
Interurban railways
Merchandising transportation
Parking of cars
Publicity
Public, Relations with
Rapid transit (elevated and subway)
Schedules and timetables
Signals
Street traffic congestion
Traffic investigations
Traffic regulation
Traffic stimulation
Transportation, Metropolitan (general studies)

MISCELLANEOUS
European practice
Management
Noise reduction
Railway construction proposed
Railways (general)
Snow and ice removal
Standardization
Wood preservation

Bus body (Bender), *62.
Combination pneumatic and cushion-tired wheel, 110.
Improvements in, Details, *523.
Piston ring for engines (American Hammered), *932.
Shock-absorber wheel (L. G. Smith), 110.
Valve stem wrenches (Stevens Walden-Worcester), *1008.
—Car equipment:
Dasher sign frame (Brill), *1127.
Finger for railway controllers (G. E.), 469.
Floor material, Light-weight (Johns-Manville), *687.
Headlining, Light-weight (Haskelite), 812.
Resistor grids, Changes in (Westinghouse), *20.
Reversible window (Ottawa), *648.
Safety panelboards (Westinghouse), *1052.
Snow scraper with air wing (Root Spring), *1090.
Trolley base, Light weight (Ohio Brass), *1008.
Trolley harp and wheel, Self-oiling (National Oil), *932.
—Carpenter shop:
Hand saw, Electric (Wappat), *467.
—Electrical shop:
Arc welder, Heavy duty (Westinghouse), *1008.
Arc welder, Tractor mounted (Lincoln), *230.
Attachment plug, Cord grip (Cutler-Hammer), *20.
Blower, Portable (Ideal), *148.
Brake for cranes (Electric Controller), *932.
Controller, "Dinkey" type (Electric), *846.
Drill, Portable electric (U. S. Electrical), *812.
Mica undercutter (Ideal), *230.
Panel for charging batteries (G. E.), *469.
Relay, Undervoltage (G. E.), *467.
Solder for railway motors [Silberstein], 968.
Tool rest for commutator grinding (Ideal), *1052.
Maintenance equipment (Continued):
—Line:
Clamp for driving ground rod, *62.
Grounding wire connection clamp (Copper weld), *230.
Testing instruments, Portable (Westinghouse), *1127.
Tower truck, Hydraulic (Wood), *468.
Trolley splicing sleeve (G.E.), *1127.
—Machine shop:
Blacksmith hammer (Blacker), *968.
Differential chain hoist (Chisholm-Moore), *468.
Drill, Portable (Black & Decker), *469.
Field weakening device (Auto Shunt), *932.
Goggles, Skeleton helmet (Oxweld), *1127.
Hydraulic feed surface grinders (Gallmeyer & Livingston), *812.
Iron worker, Universal (Buffalo), *846.
Line starter (Westinghouse), *846.
Oil testing set, Portable (Westinghouse), *1090.
Radial arm for portable drill (Hisey Wolf), *148.
Reversing motor control switch (G.E.), *1052.
Sanding tool (U. S. Electric Tool), *648.
Socket wrenches, Heavy duty (Bonney), *768.
Swinging crane (Poor), *20.
Vertical spindle grinders (Hisey-Wolf), *648.
—Paint shop:
Spray gun, Dialed head (Alexander Milburn), *230.
—Track and way:
Concrete breaker (Sullivan), *968.
Crossing signals for Peru (Nachod), *190.
Earth drill, Trailer type (Buda), *768.
Floodlighting attachment for acetylene tanks (Prest-O-Lite), *968.
Improved types, Details, *529.
Oiler and spraying machine (O. F. Jordan), *686.
Tractor type compressor (Pontiac), *469.
Traffic marker, Monell metal (Metal Traffic), *148.
Welding rod (Lincoln), *1090.
Wheelbarrow mounting for oil burner tank (Chausse), *190.
—Trucks:
Slack adjuster (J. G. Brill), *467.

Electric Railway Journal

McGraw-Hill Publishing Co., Inc.
JAMES H. MCGRAW, President

Consolidation of Street Railway Journal and Electric Railway Review
CHARLES GORDON, Editor

LOUIS F. STOLL, General Manager

Volume 72 — New York, Saturday, July 7, 1928 — Number 1

ELECTRIC RAILWAY JOURNAL is a consolidation of *Street Railway Journal* and *Electric Railway Review*, effected in 1908.

In November, 1884, *Street Railway Journal* began publication, having been started a few months earlier as the street railway department of the *Journal of Railway Appliances*. The new paper was edited during various periods by Robert Grimshaw, George L. Fowler, Emerson P. Harris, C. B. Fairchild and Edward E. Higgins.

In May, 1908, *Electric Railway Review* was purchased and consolidated with *Street Railway Journal* to form ELECTRIC RAILWAY JOURNAL. Henry W. Blake, who joined the staff of *Street Railway Journal* in 1891 and in 1894 became its editor, continued as the editor of ELECTRIC RAILWAY JOURNAL until 1925, when he was made senior editor. Harold V. Bozell was co-editor from 1920 to 1922 and Harry L. Brown was co-editor from 1923 to January, 1925. Charles Gordon became editor in February, 1926.

The present staff is as follows: Editor, Charles Gordon; managing editor, Morris Buck; senior editor, Henry W. Blake; editorial staff, John A. Miller, Jr., Clarence W. Squier, George J. MacMurray, C. A. Faust, J. W. McCloy and L. H. Church (Chicago). Paul Wooton is Washington correspondent and Alex. McCallum is London editorial representative.

Signals Should Move Traffic, Not Stop It

LOSSES through traffic delays amounting to some $540,000,000 in the city of New York alone form a staggering record of the inefficiency in our methods of handling one of the nation's most pressing problems. Its importance was brought out at the recent meeting of the New York Electric Railway Association in the paper by John A. Miller, Jr., and the discussion by H. S. Simpson. This enormous sum, which is greater than the total annual expenditures of several European and Latin-American governments, also exceeds the budget of New York City by $28,000,000. What the total sum for the nation is when all the cities of the country are taken into account can well be left to the imagination.

Whenever traffic control lights are installed with little study as to their adequacy, but merely to save the salaries of policemen, the citizens more than pay for what the city administration thinks it has saved. As a writer remarked in Detroit, when a senseless mechanical contrivance winks its illuminated eye and keeps thousands waiting for no purpose, the value of the thing is indeed questionable. It is more than that; it is vexatious and wasteful.

Three kinds of control are in general use. These are the synchronized type, in which all lights for an entire street show green for a given period and then red for a given period; the wave or platoon system, which is similar to the former, all lights changing at the same time, but in which alternate signals or groups of signals give different indications, and the co-ordinated lights such as have been installed on certain streets in Chicago and Cleveland, carefully adjusted to the needs of each intersection. The value of the last was attested by Mr. Simpson when he stated that its installation in Chicago, together with the no-parking restriction in the Loop area, has done far more to alleviate traffic congestion there than the very much more expensive and much talked about $22,000,000 Wacker Drive improvement. Expensive and visionary double and triple-decked street projects appeal to the popular imagination, but it is through intelligent utilization of existing street facilities that the greatest improvement in traffic movement will come.

Engineering Library

From the General to the Specific in Employee Training

SALES training of platform employees has been for several years the subject of discussion among electric railway executives. Much of the expressed thought on this important phase of the local transportation business, however, has been in broad generalities bordering dangerously on platitudes. Little progress seems to have been made in the definite application of "transportation selling" talk to the daily performance of the man on the platform.

All this is not to say that the industry has made no progress in the important matter of better-trained employees; quite the contrary. In the very fact of the wide attention that has been given the subject is the best possible evidence that the industry recognizes, as it has probably never recognized before, the enormous power for good or evil of the daily contacts between its employees and passengers. Merely the general recognition of their importance is in itself substantial progress.

Nevertheless, the fact remains that the expressions, "merchandising transportation," "selling service," "making salesmen of platform men" and similar phrases, have had little interpretation into daily performance on the platforms of local transportation vehicles. For this reason there is more than passing interest in the thoughts expressed by Clinton D. Smith of Cleveland and R. N. Graham of Youngstown, at the recent meeting of the Central Electric Railway Association. Mr. Smith drew a clear distinction between the several branches of personnel work—ranging from selection and routine training to welfare activity—and the specific matter of sales training. In Cleveland a separate division of the personnel department has been established to deal exclusively with sales training.

Mr. Graham, on the other hand, endeavored to define the kind of selling which the platform man has the opportunity to perform. His analysis led to the conclu-

Digitized by Google

sion that unfailing courtesy to passengers is the highest form of transportation salesmanship, and that specific training to make men more adept at handling difficult situations on a car platform is entirely feasible and necessary.

These views seem to represent distinct forward progress in thought on employee training. They suggest that there are several alternatives in the procedure for training better platform men. As an initial step he may be "told to be" courteous. In too many instances this represents the total extent of training activity on some railway properties. Then again, he may be "told how" to be courteous. Some properties have gone that far. But before the average man may be expected to make much definite improvement in his manner of handling passengers, he must be "shown how" to be courteous by actual reproduction in training of the situations which he is called on to meet in service. If that be true, the industry still has considerable room for improvement in its training methods.

New Basis for Cleveland Suburban Riders

TWO significant things have occurred recently in Cleveland. These are the decision of the arbitrators in the East Cleveland fare dispute and the suggested trial of the zone system. The fare differential in the East Cleveland case is fixed at 2 cents, but the two occurrences are linked since the zone suggestion, made by the Cleveland Railway to the Council, followed a recommendation of this kind by the arbitrators in their findings in the East Cleveland case. So far as East Cleveland is concerned, that matter is settled, but there still remains the question of dealing with the fares to Cleveland Heights and Lakewood. It seems unlikely that the Council will consider the zone proposal seriously unless some arrangement is made to put the higher fare into effect in the suburbs just mentioned.

The 2-cent differential, however, is more than tangible. It is a fact. As the Cleveland *Plain Dealer* sees it, the decision of the arbitrators in the East Cleveland fare dispute is far more important than the number of car riders or the amount of money involved might indicate. It is likely to set a precedent that will control the fare question in other important suburbs. This means progress, since the arbitrators' decree in the East Cleveland case marks the first acceptance in principle of a recommendation made by the Metropolitan Transportation Commission three years ago that changes be made in the Tayler ordinance calculated to strengthen the finances of the company and to enable it to serve the public better.

Several of these recommendations were adopted, but the proposed fare differential between Cleveland and the suburbs long remained merely a topic of discussion. In substance, the proposal was that new franchises be negotiated with Lakewood, East Cleveland and Cleveland Heights whereby each would agree to pay the prevailing Cleveland fare plus 1 cent for a through ride. The arbitrators in the East Cleveland case went farther than the commission proposed and fixed the differential at 2 cents. This means that East Cleveland passengers will pay 9 cents for a ride to Cleveland. The supposition is that the other suburbs will be asked to fall in line on a similar basis. No matter what may come out of the zone proposal, it remains a fact that the East Cleveland settlement has the obvious virtue of being a painstaking attempt to put suburban transportation at Cleveland on a real service-at-cost basis.

The Manufacturer's Responsibility for Repair Parts

RESPONSIBILITY for the operation of a piece of apparatus rests with the original builder, according to E. C. Brandt, speaking before the New York Electric Railway Association last month. The main business of the railway is selling rides and transporting the passengers. When a vehicle is tied up for repairs it is imperative that everything should be done to get it back on the road as expeditiously as possible. This, he holds, is the reason why in some shops the repair is made with whatever part is at hand and why on other systems the railways turn to the home manufacture of their own maintenance parts.

As Mr. Brandt sees it, it is to the advantage of the railways to have renewal parts furnished by the original supplier in that he can furnish standard maintenance data, information and engineering service as well. Every large manufacturer and many of the smaller ones have the equipment and facilities to furnish promptly repair parts both of high quality and particularly suitable for use with the original apparatus. The manufacturers can reduce their costs of making parts and at the same time give better service by the development of a renewal and maintenance parts department where all of their customers' requirements can be centralized in one place to insure quantity production. Since the original manufacturer of any equipment cares more about the performance of his product than does anyone else he is anxious to see that the customer has the best of renewal parts and service. This can be made possible only by reference to the drawings, specifications, materials and engineering used in the original apparatus.

The underlying cause of home manufacture of parts, according to Mr. Brandt, is that the manufacturer has shirked his responsibility. All renewal parts should be standardized as to sizes, materials and specifications in a manner similar to new parts. Parts with over and under sizes must be standardized as well as those of original dimensions.

In its final analysis the renewal parts problem is largely attributable to the manufacturer's failure to understand adequately the operator's requirements.

Track Resiliency and Its Effect on Noise

THIRTY years ago, in laying its underground conduit track, the Third Avenue Railway, New York, inserted a small leaf spring between the base of each rail and the seat in the yoke on which the rail rested. The purpose was to produce a resilient track. The springs soon flattened out under the weight of the traffic on them and became useless. Although the experiment was a failure, it is noticeable that even in those early days the advantages of resiliency in track were recognized.

European tramways have done more in this direction than electric railways here. This is undoubtedly one reason, though not the only one, for the quietness in operation of European street cars mentioned by many returning travelers. An article in the June 16 issue of ELECTRIC RAILWAY JOURNAL told how Cologne obtains resiliency. The rails rest on a base of asphalt composition, $1\frac{3}{8}$ in. thick and $7\frac{3}{32}$ in. wide, or the width of the rail base. Much the same construction is used in other cities in Central Europe. In Paris, where the form of track construction used calls for iron chairs embedded in

Digitized by Google

Engineering Library

concrete to hold the rails, a block of Chinese teak wood, ½ in. thick, is inserted between the base of the rail and the chair. The purpose of this block, like that of the asphalt in Cologne, is to provide a more elastic support than if the rails were held rigidly. The author of the article on the Cologne construction says that on track laid in this way corrugations almost never develop in service. More quiet operation is a by-product.

If those who are seeking more quiet car operation are fearful of the expense involved in a flexible rail base, there are other means of noise reduction which are not so expensive. Observers of European practice have listed the following as among the reasons for the more quiet operation of street cars in Europe than in America: better maintenance of track and cars, slower speed of cars, greater use of wood in car construction, extensive employment of fixed window sash, fewer car parts to get loose, more general use of flange-bearing special work and more thorough greasing of curves. European managers may have a great deal to learn about certain features of American electric railway practice, but there is also much of benefit which could be obtained from European practice. Some of the methods listed above for noise reduction may not easily be applied or be appropriate here, but there is no valid excuse for poor maintenance of cars and track. It is one of the lessons we can learn from Europe.

Conserving Man Power

FEW persons realize the extreme importance of thorough and regular physical examinations in conserving their own lives and keeping in the best of health. Neither do the managements of transportation companies always appreciate the value of such examinations in conserving the man power of a system and protecting the public.

Whether the work of the car or bus operator is more exacting than the corresponding work of 30 years ago is a question. Certainly the mechanical devices that have been introduced have taken away the necessity for heavy manual labor which at one time was demanded of the motorman. The old requirement that the operator stand while on duty has almost entirely been done away with, and the touch of a finger will actuate practically any of the devices. On the other hand, years ago when the automobile was a luxury and few were seen on the city streets there was no traffic problem such as we know today. Certainly a keener eye and a quicker hand are essential now. Whether the working life of the average motorman today is greater or less than that of the motorman of twenty years ago cannot be proved. But it is more essential that there be no man failure on duty.

As yet there is not a general realization among electric railway executives that a rigid physical examination is essential as a requirement for employment. Even several railways that maintain medical departments do not consider it of prime importance and few of those which demand physical excellence for applicants give health rechecks at regular intervals. The importance of doing this was stressed by Dr. W. L. Weber of the Pacific Electric Railway in a recent paper before the California Electric Railway Association. His company has found through this system that a certain small proportion of men are suffering from serious maladies. Most of these are curable through proper treatment, and the few men who should not be allowed to take the lives of passengers in their hands through physical unfitness are transferred to positions where they can be useful parts of the railway system and of the community.

It is this desire on the part of the management to conserve the men as well as the patrons that has removed the usual attitude of opposition. There is still a certain prejudice against physical examinations on the part of the average man and it is likely to be accentuated when there is a possibility that his job will be lost as a result. But opposition will give way to co-operation when the individual realizes that not only may his health be conserved and perhaps his life be prolonged, but that he will be continued in employment to the best advantage of his employer and himself.

Milan Adopts American Ideas in Cars and Fare Collection

AMERICANS can hardly realize the importance attached by European tramway managers to the decision in Milan, Italy, to change the system in that city to prepayment collection of fares. The practically universal practice abroad has always been hand collection and the issue to each passenger of a printed receipt for the fare paid. Use of this receipt, which is retained until the passenger leaves the car, had some justification with zone fares because it recorded the distance for which the passenger paid to ride. But with a flat fare—and many of the large city roads on the continent of Europe charge a flat fare now—the reason for the fare receipt, except as a means of auditing the conductor's collections, has largely disappeared. For auditing purposes, the fare box and register possess many advantages over the paper receipt.

Engineering Library

But Milan is going much farther in its modernization policy than simply to introduce prepayment and abandon fare receipts. It has put in regular service two modern pay-pass cars, and they have met with such popular approval that 460 more are to be built. It is expected that by 1929 all the obsolete cars in Milan will be retired and shortly thereafter all cars in Milan will be of the pay-pass type. An interesting fact has been that many leading European managers, returning from the Rome convention, had an opportunity to inspect this pay-pass operation. It may thus be the precursor of like changes elsewhere in Europe.

It is appropriate that a step in advance such as this should have been undertaken in Milan. Northern Italy has always been noted for its industrial enterprise and achievement, as well as for the pioneer work which it has done in many branches of electrical engineering. It is of greater importance that a decision in favor of modernization of all the rolling stock should follow as a natural consequence closely after the selection of a model. Good electric railway service is considered in Europe as essential to public welfare, even more so than it is in this country. This view of the importance of electric railway transportation to the public was emphasized by Premier Mussolini in his address at the Rome convention. In spite of the great development of bus transport in Europe—it is at least as extensive as here—the fundamental fact is recognized that electric railways are still the cheapest means of mass transportation in cities as well as the most economical in the amount of street area used per passenger carried.

Americans should be gratified at the compliment accorded them through the frank adoption in Milan of American rolling stock designs and fare collection methods on so large a scale.

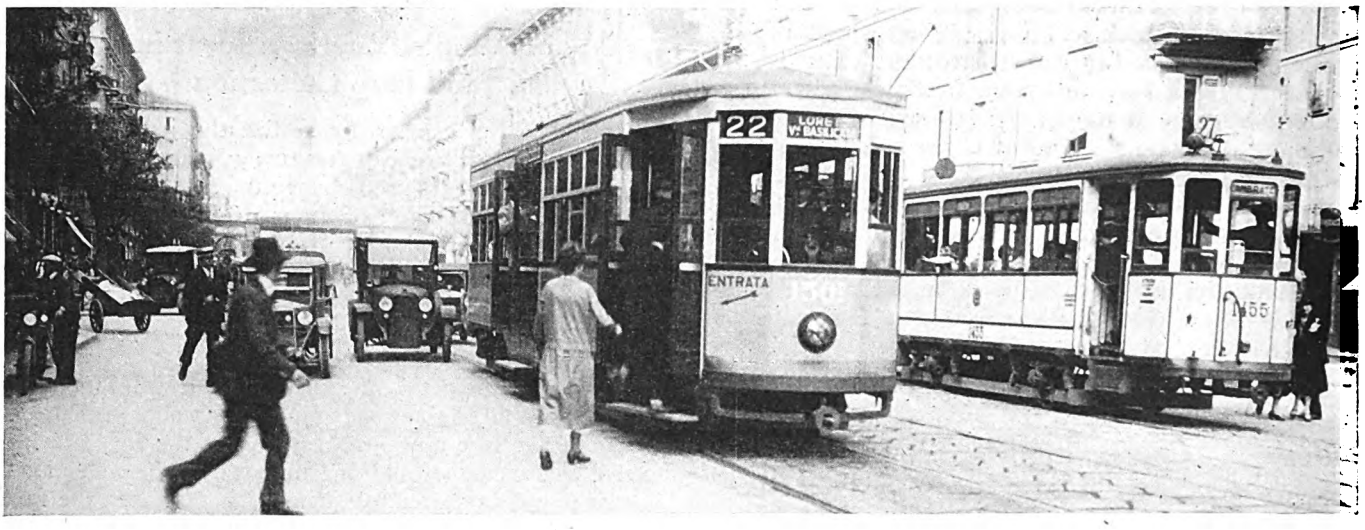
Milan Adopts Pay-as-You-Pass Cars

Large Italian city will retire all obsolete cars by end of 1929 in favor of this type. Fare boxes and registers replace paper receipts. Other features of American practice followed. Innovations attract attention of delegates returning from Rome

By Marquis Ferdinando C. Cusani
Milan, Italy



The new car is in the foreground; a car of the old type is at the right

Marquis Cusani has long been interested in electric railways and was a member of a commission which visited the United States in 1921 to study American operating practice. In his early life he was a resident of the United States while his father was Ambassador at Washington from Italy. The F. C. Cusani Company of Carate Brianze, Italy, of which he is the head, has built all-steel bus bodies for service in Milan. Its principal business is the manufacture of fire extinguishing apparatus.—EDITOR.

MILAN, a city of 1,000,000 people, the industrial capital of Italy, has always been in the forefront in the adoption of modern methods in its public utilities. 'Way back in the early '80s, the first Edison electric illuminating company to begin operations in Europe was organized in Milan, by Milanese shareholders. It has since developed into one of the most powerful superpower systems of all Europe. A few years later, as soon as the early positive experiments of street railway operation by electric power had met with success in the United States, Milan started planning one of the most extensive and up-to-date traction systems. For a long time it was considered as the best and cheapest in Europe.

At a time when a car ride in the United States sold for 5 cents, you could stop a car anywhere on a street of Milan, pay a fare of 2 cents (1 cent in the morning rush hour) and get off anywhere you chose, as cars, at that time and up to 1916, had no fixed stops.

The change in money values brought about by the war did not affect the fares very much. In fact, during certain periods the fare, translated into dollars, was practically less than the pre-war rate. But through all difficulties the Milan Tramway management stuck to its one unchangeable rule: a universal straight fare with a universal half fare during the morning rush hours.

No better field could be found for the introduction of American operating methods, and it took only the advent of a general manager whose broadmindedness should grasp the enormous advantages to be gained by the abandonment of quaint old-fashioned European operation and the substitution of the latest and best American practice, to effect the change.

The Milan Municipal Tramways, a city-owned utility, operated as a distinct unit from the other city utility services, at the end of 1926 found itself in front of obstacles that looked much like a blank wall. These were the conditions:

Many lines filled to capacity and the public clamoring for more service.

A central loop system whereby most all of the lines converged at Cathedral Square into a maze of tracks out of which it took minutes for the cars to clear themselves.

The cumbersomeness of operating two-axle motor and trail-car trains, employing three men per train.

The existence of a number of new two-axle cars weighing more than 13 tons that kept merrily hammering away all the track on the busiest routes.

Continuous power breakdowns due to the overloading of the distribution system.

Such were the difficulties with which the new general manager of city transportation, Gaetano D'Alò, was called to cope right away, in front of a clamoring public opinion and of the pressure brought to bear upon the

The Rotary Club of Milan accepts an invitation to ride on the new car

Municipal Tramways by all public bodies for a radical change and improvement in the city transportation system.

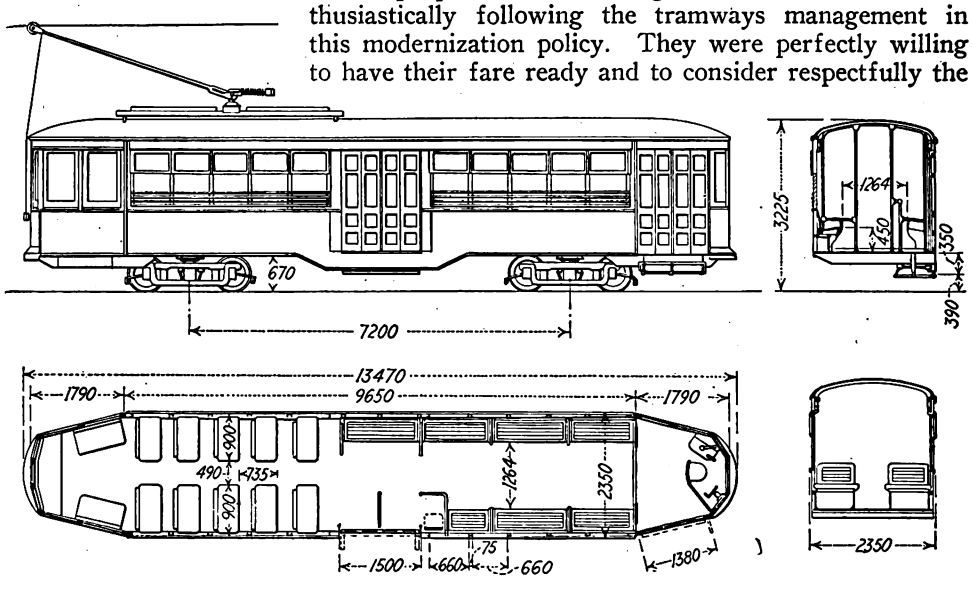
The first sweeping change was brought about during the last two months of 1926 by the complete rerouting of all car lines and the abolition of the Cathedral Square loop. The rerouting plan was prepared by Giovanni Cuccoli, engineer of the tramways corporation, under special instructions from the general manager and in accordance with the latest American practice, as set forth by ELECTRIC RAILWAY JOURNAL.

The problem had become so acute that Premier Mussolini had already taken a hand in the proceedings. Understanding that the only way out was a complete rerouting, he had given instructions to the Hon. E. Belloni, city manager of Milan, that the plan suggested by General Manager D'Alò and Engineer Cuccoli should be completely accomplished within two months.

Details of the way in which this unbelievable feat was completed in less than the specified time have already been given by Mr. Blake in the issue of ELECTRIC RAILWAY JOURNAL for July 2, 1927. But after the rerouting had been finished the difficulties facing the system were by no means over. The rerouting had practically given a 25 per cent increase in car-miles with the same number of cars, but this was really only a drop in the sea of transportation requirements. A very difficult condition with which the Milan Tramways has to cope is the existence of four rush periods each day, due to the fact that mostly everybody goes home to lunch at noon. This means that many more cars must be kept in service during long hours than would otherwise be needed and makes necessary the employment of a much greater force for trainmen.

Early in 1923 the Lombard Electric Traction Company (which operates quite an extensive system of interurban lines around Milan) had begun operating double-truck motor cars arranged for "pay within" fare collection on some of its suburban lines. Although the conductors still had to sell tickets and make change, owing to a rather complicated system of zone fares, the experiment had met with signal success.

The first move of Mr. D'Alò was therefore to borrow some cars from the Lombard Electric Traction Company and put them in service on the city lines to ascertain the feasibility of double-truck prepayment operation and the reaction of the riding public to the proposed new method. After only a few days of experimental service it became quite clear that, the contrary opinion of many official people notwithstanding, the car riders were enthusiastically following the tramways management in this modernization policy. They were perfectly willing to have their fare ready and to consider respectfully the



In spite of the limitations on over-all width imposed by narrow streets, the designers have been very successful in caring for the comfort of passengers. Dimensions in this drawing are in millimeters

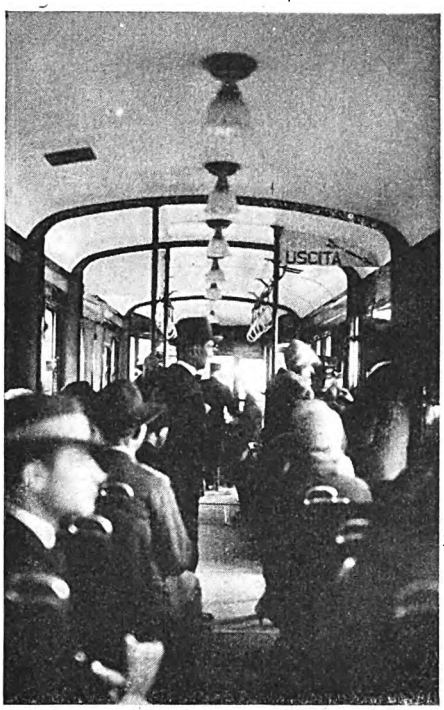
controlled doors and steps which had been fitted to some cars in an experimental way.

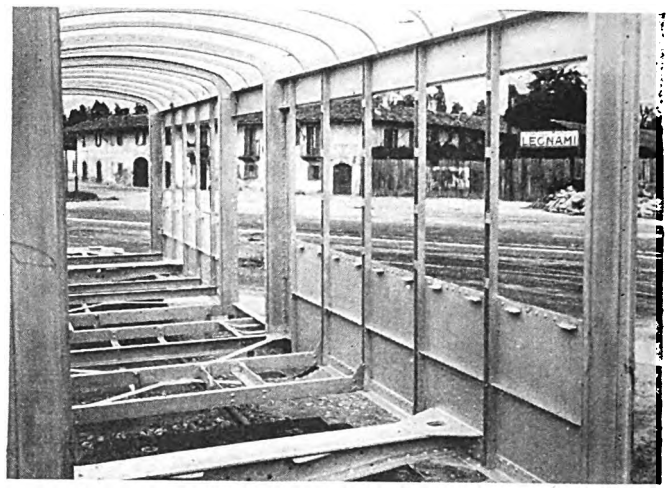
Pay-as-You-Pass Type Selected

The tramways management having decided to introduce double-truck prepayment operation, Mr. Cuccoli was set to work designing an appropriate type of all-steel light-weight car which should strictly conform to American standard practice, when during the spring of 1927 Henry W. Blake, senior editor of Electric Railway Journal, in the course of his trip through Europe was fortunately brought into contact with the Milan tramways management. After an accurate, if short, examination of the conditions governing rapid transit in Milan, he recommended with Mr. D'Alò that the "pay-as-you-pass" car be adopted as standard, that tickets be dispensed with and that fare boxes and registers be substituted.



The public soon learned to like the interior arrangement and method of paying fare

The strength of his arguments was such that Mr. D'Alò was not only able to impress upon the City Manager the necessity of building some cars of this type for experimental purposes, but in fact won the battle for pay-as-you-pass operation by removing the last semblances of zone fares and introducing the strictest policy of "only one fare for any ride on a municipal street car." Flat fares had been practically the standard before, as already explained. Engineer Cuccoli was again asked to work out a complete design of a pay-as-you-pass car which would follow all constructional standards that had been already fully proved in American operation and that would fit track and traffic conditions in Milan. The cars hitherto operated in city service had a maximum outside width of 7 ft. 1½ in. Therefore, both the devil strip on straight double track and the clearance in curves were in many instances entirely too small to allow the operation of two cars with a width sufficient to accommodate four crosswise seats and a center aisle, which were considered as absolutely essential in a car of the "pay-as-you-pass" type. The method resorted to in some American cities of building the car bodies off center on the trucks would not have been a fitting solution, as in a number of streets where the distance between tracks was ample to clear two cars in opposite directions, the vehicular lane on the outside would have been narrowed to a point where the operation of a moving vehicle between a street car and a parked conveyance would have been dangerous.



The framework during construction

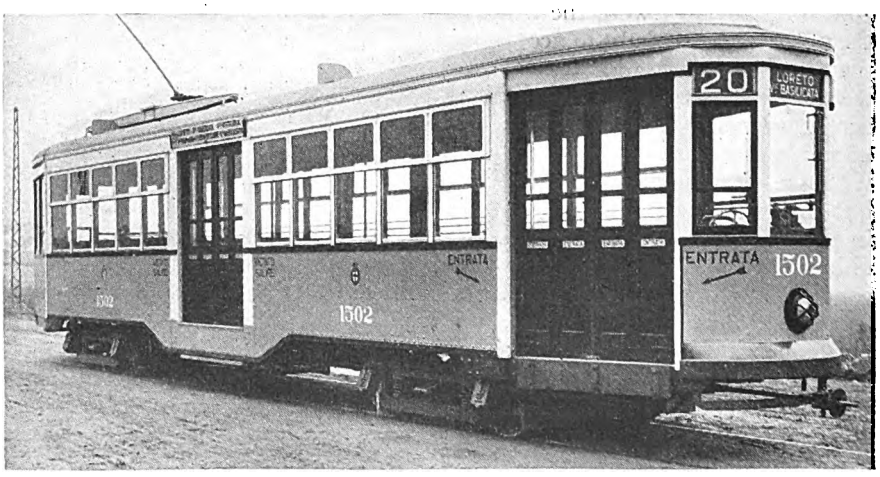
A careful survey of the whole system showed that a complete realignment of track would be, after all, the best course to follow, as it would allow the design of cars of greater capacity. The expense, which at first appeared as rather heavy, was practically reduced to a much smaller amount, as in many cases budget allowances had already been made for ordinary track renewal in the sections considered.

As soon as it was ascertained that a "pay-as-you-pass" car with a maximum outside width of 7 ft. 8½ in. could be operated on all municipal lines after the changes in track previously outlined, the work of designing such a car was pushed through.

Owing to the very peculiar conditions under which this experiment was to be started, the management decided to use only such equipment as had been developed for this particular design in America.

American Construction Practice Followed

Cast-steel frame trucks of the St. Louis pattern, pony motors and all other details of car equipment were ordered from the United States, not in the belief that Italian manufacturers could not make them, but because the American designs had been evolved after years of

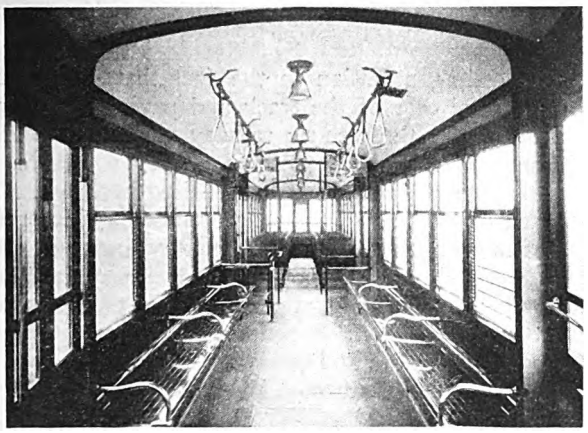


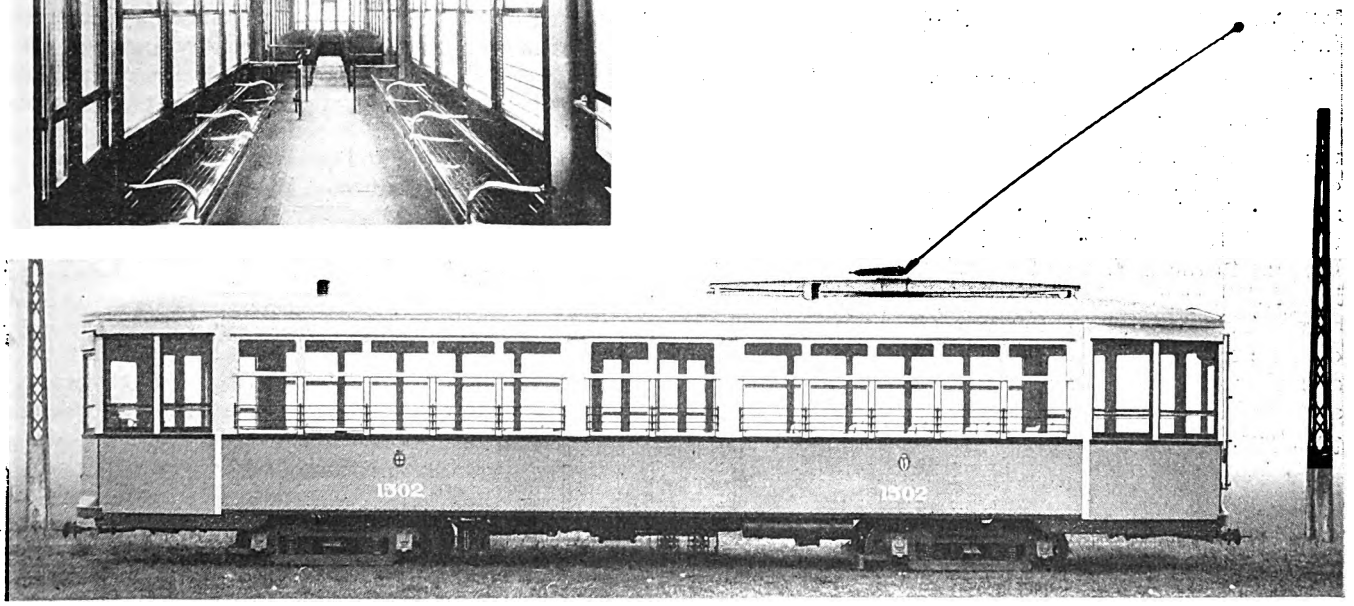
The new pay-pass car at Milan is of distinctly modern design with entrance and exit and power operated doors and steps

Digitized by Google

experience in pay-pass operation, and there was not sufficient time to design something special which would have to be submitted to prolonged tests before it could be put in actual public service.

The Italian General Electric Company and the C.E.M.S.A. Company, representing the Westinghouse interests, put their organizations at the disposal of the Municipal Tramways. In fact, they acted as the purchasing agents in America of the tramways system in order to speed up the construction of the first cars. The car bodies were built under the personal supervision of





The pay-pass car just put in service in Milan is a notable innovation to the usual European practice in cars and trucks. Its lines give it a pleasing appearance

Engineer Cuccoli at the Carminati & Toselli Company Car Works in Milan, and were finished within five months from the date of the order.

This may be considered as a record feat, when one realizes that these were the first two cars in all Europe ever to be built strictly in accordance with American car building practice and were produced by engineers, draftsmen and workmen who had never been in America, had never seen an American car and had never built anything similar.

Rotary Club Invited to Ride

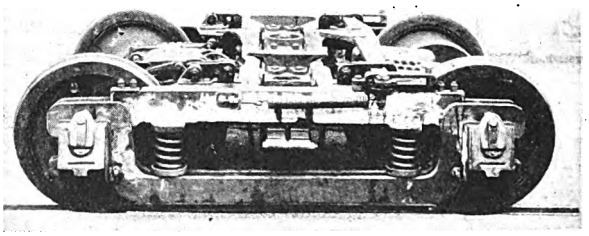
On Nov. 29, 1927, car 1501 was put through its first running test and on the next day the Milan Rotary Club was invited by the tramways management for an extended ride.

The members, among whom were many technical men, were astonished at the comfort, easy riding qualities and absence of noise of the cars and especially at the quick acceleration and braking rates which were possible without any discomfort to the passengers. They pronounced the car a wonderful step in the development of transportation facilities.

Within a few days the car was put in public service. In so doing, the management took a step which required a lot of courage, but proved, to the absolute exclusion of any doubt, that the cars could easily perform everything that was required from them. The difficulties to be met were more of a psychological than of a technical nature. The people who had only a superficial knowledge of the situation had decreed that the introduction of this system would meet with a signal failure, but the tramways management, being not devoid of a certain sense of humor, thought that if it could just throw these cars in the midst of an unsuspecting public without any dire results, the problem would be solved.

Public Likes New Cars

Therefore, car 1501 was started in service just after a one-hour tie up on the most important line. Although it was taken by storm, at the first stop, the results were



very gratifying and such as to allay any further fears of lack of success. The public of Milan was perfectly willing to adopt the new type of car. In fact, it would patronize it under all circumstances possible. People would even let an earlier car pass by in order to wait for the new ones. The public's co-operation was such that passengers would instruct their fellow riders on how to board, alight and pay fares, feeling that it was in their interest to follow the management's move for better transportation.

After six months it has been found that the cars came up to all expectations. The public has thoroughly understood how to get aboard and how to leave the car, and it has completely followed the idea of Mr. Witt that it is much more comfortable to ride on an upholstered cross-seat than on a lengthwise one.

Conductors were supplied with coin changers of the

Digitized by Google

type commonly used in America, and within a few weeks Johnson fare boxes with International registers will be installed, doing away with the use of tickets. This is certainly an epoch-making step in Europe, as it goes against all the time-worn practices of issuing a ticket for each fare paid.

Cars Attract the Attention of the Conventionists from Rome

During the first months in service, the experiment was not brought to the attention of operating officials outside of the city as it was thought that the cars had to prove their merits before being talked about, but, after the close of the recent International Electric Railway Convention in Rome, many of the delegates made it a point to visit Milan and were astonished at the wonderful performance which the cars were giving. It can certainly be surmised that many an engineer is now going back home thinking that it takes not only knowledge, but pluck, to operate electric railway transportation systems in a modern way.

260 Cars Ordered, More to Follow

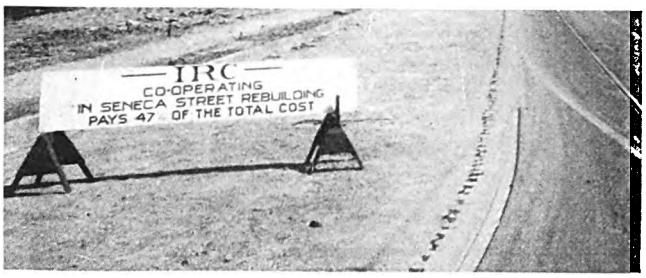
In the meantime the Milan Tramway management, on the basis of data gathered during the operation of the experimental cars, could easily figure out that an enormous saving in operating expenses could be reached by their wholesale adoption, and the City Manager was brought to the decision of ordering, right away, a first lot of 260, soon to be followed by a second lot of 200 cars. This will allow for the retirement of all the obsolete cars during 1929, and it is probable that within a further short period all the thousand-odd cars in operation in Milan will give place to those of the pay-as-you-pass type.

Americans who are not conversant with the various and often quaint methods of street railway service in Europe cannot appreciate the extent of a reform which has swept away all sorts of zone fares and tickets, which has introduced a car which promotes safety, speeds up the service and lowers enormously the expenses of operation.

To them it will appear just as a thing which is all in the day's work, but to the European, accustomed to the slowness, the high steps, the grab handles onto which all the male population could hang for dear life, and to the mixed blessings of a zone fare and of the conductor's feet marching on the passengers' corns, this appears as something revolutionary.

The Milan tramway management has not only solved its own problem. It has pointed out the right and modern way of operating an electric railway transportation system in the interest of the public and to the advantage of the operator.

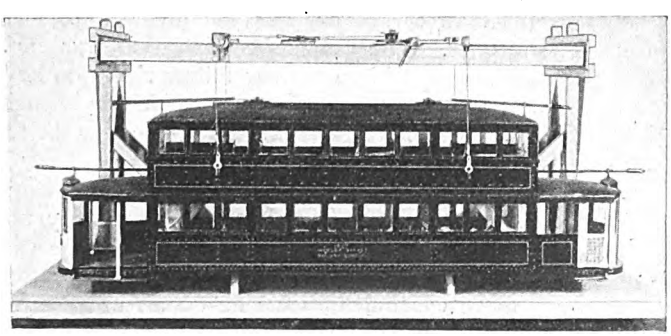
Signs Tell of Railway's Part in Street Work

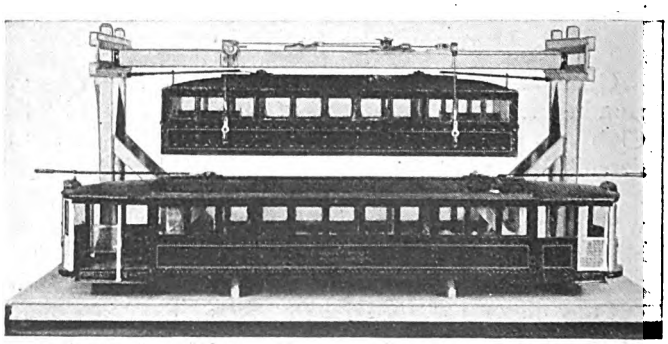


SIGNS calling attention to the fact that 47 per cent of the total cost of the track and paving reconstruction is borne by the electric railway were displayed by the International Railway, Buffalo, N. Y., to inform the public of its part in the street rebuilding program. The buckboard sign shown in the accompanying illustration is one of many similar signs prominently displayed along Seneca Street during its reconstruction last year. Most of the signs were placed at highway intersections used by motorists coming to Buffalo from the western part of New York State and Pennsylvania.

Removable Double-Deck Car Suggested Traffic Aid

GETTING sufficient cars to handle rush-hour traffic in available space on San Francisco streets is a problem that has led A. W. Brohman, superintendent of transportation of the Market Street Railway, to design the double-deck car shown in model form in the accompanying illustrations. A feature of Mr. Brohman's idea is a removable upper deck for use only during rush hours. A traveling crane at carhouses would be used to place the upper deck on the main car body or remove it. The idea includes locking the upper deck automatically to the main car body and also making electrical connections and opening and closing doors at the head of stairways automatically as the upper deck is lowered into place or removed. The car would have an over-all length of 50 ft. and an over-all height of 16 ft. Seating capacity of the main car would be 44 and of the upper deck 40, making a total of 84. Total weight is estimated at 45,000 lb., of which the upper deck would weigh 8,000 lb. Spacious one-step platforms would avoid loading congestion and enable passengers readily to enter the top deck by a stairway from the rear platform and to leave by a front stairway. Patents have been applied for by Mr. Brohman on some of these features.





Model of double-deck car seating 84 passengers proposed by A. W. Brohman of Market Street Railway

Bus Terminal Offers Many Conveniences

Mitten Tours terminal, located in the heart of Philadelphia, shares quarters with bank. Buses for New York, Atlantic City and Western points stop at the terminal

TRAVELERS arriving at the bus terminal of the Mitten Tours find themselves in the heart of Philadelphia, convenient to hotels, theaters, office buildings and the shopping center, the terminal occupying the ground floor of the Mitten Building, at Broad and Locust Streets. In addition to the advantage of the location, this terminal offers many conveniences. All night long the lights welcome the arriving traveler, and the day and night bank, situated on the same floor, cashes or sells travelers' checks, or serves its clientele in other ways.

The terminal may be entered from two sides. The Broad Street entrance faces a wide stairway leading to the mezzanine floor, which is occupied by the Mitten Bank departments for women and for workers' loans. The general banking services are on the first floor. At the rear of the waiting room are the ticket and information office and the corridor leading to the elevators. American walnut has been used in all woodwork, seats and desks in the quarters.

It has been found desirable to place bus terminals in the best locations the various cities served can afford. The bus has the advantage of being welcome anywhere and the company is capitalizing this advantage. At the Philadelphia terminal passengers find themselves near everything they could possibly need.

If the arriving traveler has only a few minutes to stay, the terminal building itself offers rest, information, money arrangements, telephone service and parcel checking. An information agency has been developed that is helpful to the traveler. Itineraries are planned for the pleasure-touring vacationist on the Mitten and connecting lines, with estimated cost and times of arrival and departure. This class of passenger traffic is found to increase yearly. Another convenience of this terminal is the lost and found department which adjoins the waiting room. This department also handles articles found on the local buses, the street cars and the taxicabs which are under the same management.

Interior view of the Mitten Tours ticket and information office

Every 1½ hours between 6:30 a.m. and 6:30 p.m. a bus leaves for New York, and one arrives every 1½ hours between 11 a.m. and 11 p.m. On the spring and summer schedules, a bus leaves for New York at 12:15 a.m. and one leaves New York for Philadelphia at the same hour. Every two hours between 7 in the morning and 7 in the evening a bus leaves for Atlantic City, and every two hours between 10:30 a.m. and 8:30 p.m. a bus arrives from there, with a late bus arriving at 11:30 p.m.

These schedules are adequate only for the working days of the week. On week-ends the service is augmented to meet the demands from every half hour to every ten minutes. On Easter Sunday of this year the company sent a bus away from the terminal for Atlantic City every ten minutes from early morning until mid-afternoon. Additional buses are used also on Saturday and Sunday over the New York route.

This current of travel deposits a great many transients at the terminal. The New Yorker wanting to go to Atlantic City by way of Philadelphia can make his stay cover the hour from 12 to 1 or from 6 to 7. Connecting with the Washington or Baltimore buses, the traveler from New York can enjoy stopover periods of three hours or less.

To the doors of the Philadelphia terminal come the buses of the Greyhound lines, which are direct connections with the Middle West, Southwest and Great Lakes

Banking quarters are situated on the same floor as the bus terminal, convenient for travelers

Digitized by Google

Bus unloading at the Philadelphia terminal. After unloading the buses are kept in garages until needed for another run

region, and this makes Philadelphia an important point in long-distance travel. From this terminal point many transportation lines radiate to other Eastern cities, and a general transfer takes place here. Passengers from the West, many of them from the Pacific Coast, may change for New York and Boston, or Atlantic City, Baltimore and Washington.

Line Breakers Regularly Tested in Kansas City

By J. W. Weir
Assistant to General Superintendent of Maintenance
Kansas City Public Service Company, Kansas City, Mo.

EQUIPMENT has been devised and installed in all of the carhouses of the Kansas City Public Service Company for testing the line breakers on the company's modernized street cars. Twice each year, during February and August, all the breakers on the system are checked and, where necessary, recalibrated. This is done to find defective breakers, particularly those with high or low settings. Incorrect settings are somewhat hazardous and usually result in traffic tie-ups. In addition to routine testing, checks are made of line breakers reported by trainmen as being unsatisfactory.

The equipment used for the tests consists of a line breaker, ammeter and two switches, all mounted on a panel, and two grid resistors and a water rheostat. To conduct a test the trolley lead of the car is removed at the controller and connected to a portable lead from the testing set. The controller handle is then advanced, admitting current to the holding coil and causing the line breaker to close. With the breaker closed, a circuit is completed through the main fuse, the line breaker itself and the testing set.

By means of a single-pole, double-throw switch one grid resistor or two in series can be placed in parallel with the water rheostat. With this switch closed a second one between the line breaker and the joint resistance is closed. The current then is increased by lowering the free plate of the rheostat into the solution. The plate is raised or lowered by a cord which is wound on a small drum, the drum being turned by a wheel on the front of the panel. The capacity of the rheostat is changed by varying the strength of the salt solution.

As the current increases its value is observed on an ammeter and the value at which the breaker trips is recorded. Predetermined current values at which the breakers should trip are charted on a graph located near the set.

The set consists of two grid resistors, a water rheostat and a panelboard with an ammeter, two switches and a circuit breaker. The wiring is shown at the right

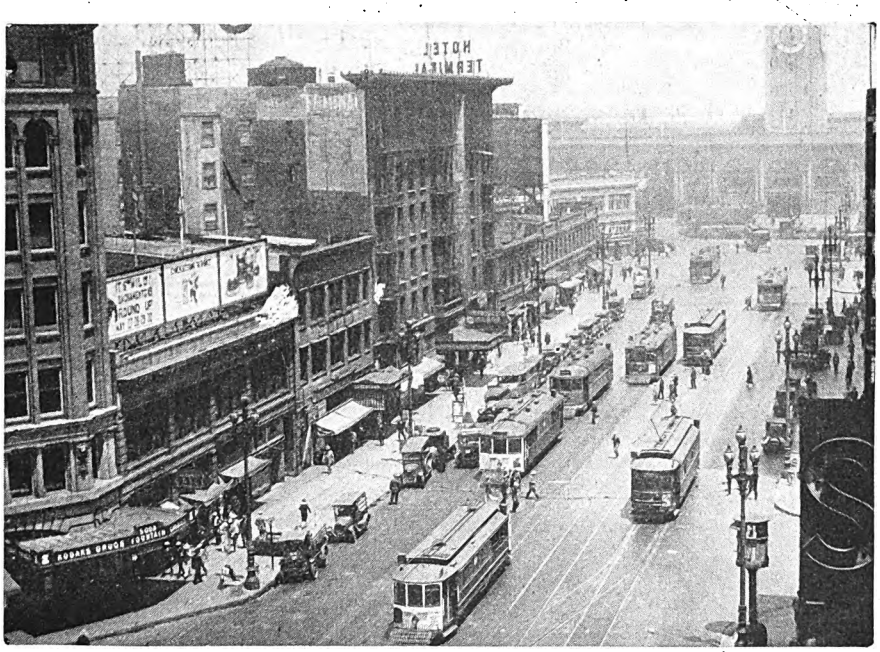
San Francisco Needs

Street Traffic Control

Concluding portion of McClintock report points to need of pedestrian control, restricted automobile parking in business district and installation of traffic signals. A complete traffic ordinance is proposed

SECOND ARTICLE



"Jay walking" is practiced even on Market Street, with its four lines of cars

IN THE issue of ELECTRIC RAILWAY JOURNAL for June 30 a summary was given of the first portion of a traffic report in San Francisco, prepared by Dr. Miller McClintock, director of the Albert Russel Erskine Bureau for Street Traffic Research of Harvard University. The recommendations made in the report were outlined in the first article and the characteristics of traffic flow and the electric railway situation treated. The report also gives a great deal of attention to pedestrian movement and the question of street congestion caused by automobile traffic and parking. These are treated in the following paragraphs.

OBSTRUCTIONS HINDER PEDESTRIAN TRAVEL

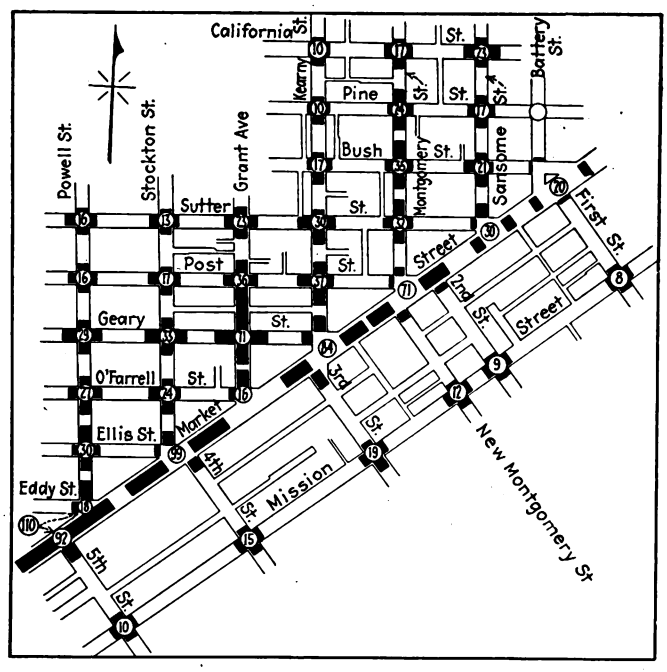
San Francisco is fortunate in possessing unusually wide sidewalks. Even so, the high concentration of traffic in certain parts of the central district during the peak hours of the day results in uncomfortable crowding. An intensive check of pedestrian movement at various intersections during a typical eight-hour business day revealed that there are more than 1,000,000 pedestrian movements to downtown intersections each day. In comparing the pedestrian flow studies made by the survey with those made at various periods in the past by the San Francisco Building Owners' and Managers' Association, the discovery was made that during the past three years there has been a substantial reduction in volume.

The survey staff also conducted all-day studies of pedestrian movements in the shopping and financial districts to determine the relation between the speed with which walkers could move and the density of sidewalk traffic. These studies proved conclusively that as the crowd increases, the speed decreases. This means a greater length of time for movement between shops.

The city has been careless in the protection of sidewalks against unnecessary obstructions, both private and public. A comprehensive study of the central business district revealed a great many obstructions, but those most numerous were trolley and light poles, fire plugs, open elevator covers, news stands, trash boxes and parking signs. The obstructions which occupied the greatest per cent of the sidewalk width were open elevator covers, flower stands, merchandise, bicycle stands and signs.

By far the great majority of fatal traffic accidents in San Francisco are the result of collisions between motor cars and pedestrians in the roadways. The responsibility of both motorist and pedestrian is mutual. This condition is due largely to a lack of definite standards of

Digitized by Google



Pedestrians entering intersections in central business district of San Francisco on a typical week day of eight hours in October, 1926. The numbers indicate thousands of persons

rights and responsibilities of walkers and drivers in the public streets.

As a substitute for the present common law rule which provides that the rights of pedestrians and drivers shall be exercised at all places on the highway in accordance with equal and mutual rights, the report recommends that in certain portions of roadways pedestrians be given absolute and exclusive right of way over motor vehicles, and that at other places motor cars be given a qualified right of way over pedestrians. Pedestrian right of way is desirable where crossing of roadways is normally most frequent; that is, at or near street intersections. Between intersections drivers of vehicles should be given the qualified right of way over pedestrians.

In order that pedestrians at intersections may be given definite knowledge as to the precise places where they may cross, a system of marked cross-walks is proposed. The metallic cross-walk markers which are at present in general use are believed adequate for the greater number of intersections. A more visible marking, however, is required in certain places. Under certain conditions the volume of pedestrian and vehicular traffic is so great and the area of control so large that it is impossible to bring about suitable adjustment by means of regulations. Under these circumstances it is recommended that physical construction be resorted to which will make possible

Abstract of Proposed Ordinance Regulating

BE IT ORDAINED by the people of the city and county of San Francisco as follows:

Article I—Definitions

Section 1. (This section gives the definitions for the following terms: street, roadway, alley, sidewalk, intersection, crosswalk, safety zone, loading zone, vehicle, street car, pedestrian, operator, traffic, central traffic district, business district, right-of-way, park and official warning and direction signs).

Article II—Authority of Police, Traffic Signs and Signals

Section 2. *Obedience to police.* Officers of the police department are hereby authorized to direct all traffic by means of visible or audible signals, and it shall be unlawful for any person to refuse or fail to comply with any lawful order, signal or direction of a traffic or police officer.

Section 3. *Signs.* The board of supervisors shall by resolution determine and designate the character of all official warning and direction signs and signals. All signs authorized hereunder for a particular purpose shall be uniform.

Section 4. *Obedience to traffic signs.* It shall be unlawful for any operator or pedestrian to disobey the instructions of any mechanical or electrical traffic signal, traffic sign, or marks upon the street placed in accordance with the provisions of this ordinance. No public utility or department in the city shall erect or place any barrier or sign unless of a type first approved by the Board of Public Works.

Section 5. *Traffic stop and go signal legend.* Stop and go mechanical or electrical signals must use the colors, red, green and amber to indicate stop, go and prepare for a change, respectively.

Section 6. *The Board of Public Works is required to establish cross-walks.*

Section 7. *Display of unauthorized signs prohibited.*

Section 8. *Emergency vehicles are exempt from certain rules.*

Article III—Pedestrians

Section 9. *Pedestrian's right of way at intersection.*

(a) It shall be unlawful for the operator of any vehicle to drive into any cross-walk while any pedestrian is engaged in crossing the roadway.

(b) The foregoing provisions of this section shall not apply at intersections where traffic is being directed by an officer or a traffic stop and go signal, at which intersections the rights of pedestrians and operators of vehicles shall be exercised under the direction of the officer or traffic signals.

Section 10. *Pedestrian's limited right to use of roadway.* When within the central traffic district or a business district, no pedestrian shall cross a roadway other than by a cross-walk.

Section 11. *Pedestrians to obey signals.* At intersections where traffic is directed by a traffic or police officer or by a traffic stop and go signal, it shall be unlawful for any pedestrian to cross the roadway other than with released traffic.

Section 12. *Pedestrians standing on sidewalks.* In the central traffic district or in any business district it shall be unlawful for any pedestrian to stand on the sidewalk except as near as is practical to the building line or the curb line.

Article IV—Rules for Driving

Section 13. *Method of approach for left turn.* The operator of a vehicle intending to turn to the left at an intersection or into an alley or driveway shall approach the point of turning in the line of traffic next to the center of the roadway.

Section 14. *Method of turning to left at intersections.* Operator shall pass to the right of the center of the intersection before turning.

Section 15. *Location of turning markers.* (Locations for markers specified.)

Section 16. *Left turns prohibited at certain intersections.*

Section 17. *Method of approach for right turn.* The operator of a vehicle intending to turn to the right at an intersection or into an alley or driveway shall approach the point of turning in the line of traffic nearest the right-hand edge or curb of the street.

Section 18. *When right turns may be made.* In the central traffic district right turns may be made only on "Go" signal.

Section 19. *Turning around at intersections prohibited.*

Section 20. *Driving from alleys.* The operator of a vehicle emerging from an alley shall stop immediately prior to driving onto a sidewalk.

Section 21. *Vehicles shall not be driven on sidewalks nor in safety zones.*

Section 22. *Traffic lanes.* The Board of Public Works is hereby authorized to mark traffic lanes upon the roadway where a regular alignment of traffic is necessary.

Section 23. *Certain vehicles prohibited in central traffic district.*

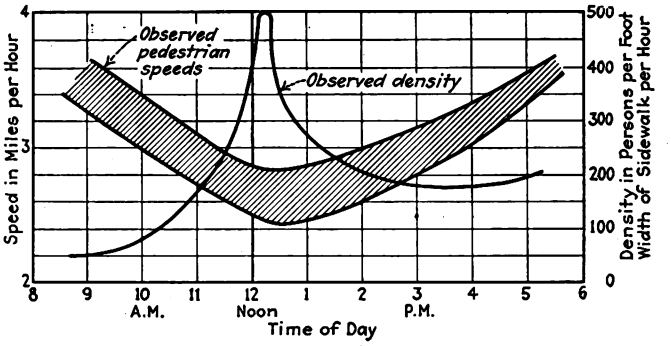
Section 24. *Arterial streets.* (Twenty-four streets or parts of streets were declared to constitute arterial streets.)

Section 25. *Restricted traffic streets.* (Parts of five streets were designated as restricted traffic streets.)

Section 26. *One-way streets.* (Fourteen streets and parts of streets were designated as one-way.)

Digitized by Google

a separation of the conflicting types of traffic. Further consideration of the development of safety zones for the use of street car patrons is held to be essential. Operating conditions of the street cars make it necessary for persons to stand in the roadway, in places that are dangerous unless there is a definite rule protecting them from vehicular interference. It is important both from the standpoint of greater protection to pedestrians, as well as to the driving public, that button safety zones be marked in the most visible manner. Atmospheric conditions in San Francisco require that special precaution be taken. To this end several recommendations are made in the report for marking the safety zones.



Observed pedestrian speeds and density between Geary and Post Streets on a typical week day in March, 1927

Automobile Storage a Severe Problem

Storage of automobiles in San Francisco, the report says, presents a severe problem. There is an extreme lack of curb parking space and many users of automobiles are dissatisfied with the present 40-minute parking ordinance. To indicate the present parking practices, the survey made intensive studies of the entire central business district and also of a typical outlying business district. In the central district study, which covered 112 blocks, it was discovered that 59 minutes is the average parking time, notwithstanding the 40-minute rule. Of the 18,958 cars which were checked, 791 parked more than three hours, 88 parked more than eight hours and 14 more than ten hours. Altogether, approximately 36 per cent of the cars were parked in violation of the law. In the typical outlying business district, where the study covered six blocks, 803 cars were parked during the interval of the study. Forty-six minutes was found to be the average parking time for the typical vehicle, though fourteen parked longer than three hours, three more than six hours and one longer than nine hours.

Difficulty in enforcement of parking ordinances arises from two principal sources. In the first place it is difficult

Traffic Upon the Streets of San Francisco

Article V—Stopping, Standing and Parking

Section 35. *Stopping prohibited in specified places.* It shall be unlawful for the operator of a vehicle to stop such vehicle in any of the following places except when necessary to avoid conflict with other traffic or in compliance with the direction of a police officer or traffic sign or signal: in an intersection, in a crosswalk, between a safety zone and the adjacent curb within 20 ft. of a point on the curb immediately opposite the end of a safety zone, within 20 ft. of an intersecting roadway, and within 20 ft. of an entrance to any fire station.

Section 36. *Standing for loading only in certain places.*

Section 37. *Parking prohibited on certain streets.*

Section 38. *Parking time limited in the central traffic district.* The operator of a vehicle shall not park such vehicle longer than 40 minutes within the central traffic district between the hours of 7 a.m. and 6. p.m. of any day, except Sundays or legal holidays, and subject to the special restrictions imposed by Sections 35, 36 and 37.

Section 39. *Parking time limited in business districts.* The operator of a vehicle shall not park such vehicle for longer than 60 minutes within any business district between the hours of 7 a.m. and 6 p.m. of any day, except Sundays or legal holidays, and subject to the special restrictions imposed by Sections 35 and 36.

Section 40. *Early morning parking limited.* It shall be unlawful for the operator of any vehicle to park said vehicle on any street for a period of time longer than one hour between the hours of 3 a.m. and 5 a.m. of any day.

Section 41. *Standing or parking close to curb.* The operator of a vehicle shall not stand or park such vehicle in a roadway other than parallel with the curb and with the two right hand wheels of the vehicle within one foot of the regularly established curb line, except upon those streets which have been marked for angle parking.

Section 42. *Parking on grades regulated.*

Article VI—Street Cars

Section 44. *Rules applicable to vehicles passing street cars.* The driver of a vehicle overtaking any railway, interurban or street car, stopped or about to stop, shall bring such vehicle to a full stop at least 10 ft. in the rear of such street car and remain stationary until passengers of the car have boarded such car or reached a place of safety, except that where a safety zone has been established, or at an intersection where traffic is controlled by an officer or a traffic stop and go signal, a vehicle need not be brought to a full stop before passing any such car, but may proceed past at a reasonable speed.

Section 45. *Driving on street car tracks, passing safety zones.* It shall be unlawful for the operator of any vehicle proceeding upon any street car tracks in front of a street car to fail to remove said vehicle from tracks as soon as practicable after signal from the operator of street car. On Market Street from the Embarcadero to Van Ness Avenue, it shall be unlawful to drive any vehicle to the left of any safety zone established at a regular street car stop. It shall be unlawful to drive any vehicle to the left of any safety zone established in the city if the roadway to the right of said safety zone is immediately available for travel.

Section 46. *Street car speed.* The operator of a street car upon a street shall operate the same at a careful and prudent speed and subject to limitations, may lawfully proceed at a speed not exceeding 15 m.p.h. in a business district, 20 m.p.h. in a residence district, or 40 m.p.h. under other conditions.

Section 47. *Boarding or alighting from street cars or vehicles.* It shall be unlawful to board or alight from a street car or vehicle in motion.

Article VII—Penalties

Section 48. *Penalty.* The penalty for the violation of any provision of the ordinance is $50 fine or 5-days imprisonment or both for the first offense, $100 fine or 10 days imprisonment or both for the second offense and $300 fine or 30 days imprisonment for the third and each additional offense, if committed within a year of the date of the first offense.

Section 49. *Disposition of fines and forfeitures.* All fines or forfeitures collected upon conviction or upon the forfeiture of bail of any person charged with a violation of any of the provisions of this ordinance shall be paid into the city treasury and deposited in a special fund, which is hereby created, to be known as the "Street Traffic Fund." There may be appropriated out of said fund such moneys as from time to time may be authorized by the Board of Supervisors for the purchase and maintenance of official traffic signs, signals, lights, and paint marks necessary to designate the provisions of this ordinance, and the balance of said fund shall be used exclusively in the construction, maintenance and improvement of public streets within this city.

Section 50. *Effect of ordinance.* If any portion of this ordinance is for any reason held to be unconstitutional, such decision shall not affect the remaining portions.

Section 51. *Repeal.* All ordinances in conflict are hereby repealed.

Proposed progressive timing of traffic signals on Market Street, from Fifth Street to Van Ness Avenue, based on speed of 10 m.p.h.

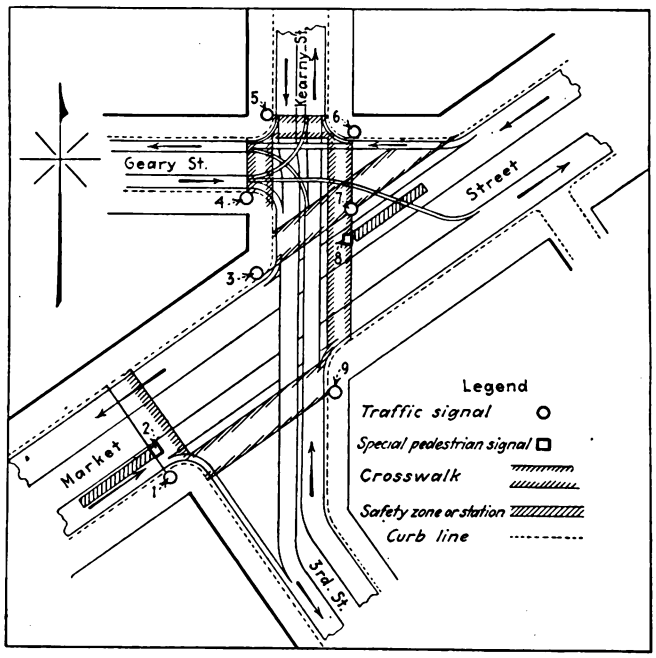
to get sufficient police personnel assigned to the task of checking parked cars. Secondly, for conviction, it is practically necessary for the police to obtain personal service upon the violator. Of the total of 18,958 cars which were studied, only 6,798 were found to be violators of the 40-minute rule, and of these, 2,298 were only mild violators, parking for from 40 minutes to one hour. The central district was monopolized by a comparatively few long-time violators. It is concluded, therefore, that the 40-minute rule as it now applies to the central district is sufficiently exact to warrant a continuation. For outlying business districts the report recommends that the parking limit be one hour, which is also a continuation of the present practice.

Each normal business day, 8 a.m. to 6 p.m., finds approximately 81,000 vehicles entering the central business district. The question as to the capacity of this district to store these vehicles while the drivers are transacting business is one of the very greatest importance, both from a standpoint of reasonable facility of traffic movement and from the standpoint of good business. The curbs of the central district in San Francisco into which the 81,000 vehicles come daily have a total length between property lines of 47,934 ft. On the assumption of 18 linear feet per car, these curbs are physically capable of accommodating at one time 2,663 cars. This figure is reduced to 2,010 cars by legal parking restrictions. With a strict obedience to the 40-minute rule, the legally available curb area would accommodate in a ten-hour day, from 8 a.m. to 6 p.m., 30,150 motor cars. With present practice, an average of 59 minutes parking time, these curbs can accommodate only 20,450 automobiles. Even with a strict observance of the 40-minute rule only 37 per cent of the automobiles entering the district could be accommodated. This pressure for parking is further indicated by the almost complete utilization of the available space at the present time. From early in the business day until approximately 5 o'clock in the afternoon, almost every legally available space is filled, which means that late-comers find it difficult to obtain a stopping place.

San Francisco shows the double line parking evil to a greater extent than practically any other city in the United States. In one single block as many as nineteen vehicles have been checked standing in double line, a large number of them trucks. A comprehensive check of the central business district, equivalent to an instantaneous view of the entire area, showed 77 automobiles standing in double line, of which 32 were passenger cars and 45 trucks.

Modes of Transportation of Retail Customers Studied

To determine the relation between motor car traffic and more especially between the curb parking of motor cars and retail business, an all-day study of the modes



One of a series of charts of recommended traffic control and vehicular traffic flow for a typical week day (eight hours) in November, 1926. This chart is for the intersection of Third, Geary, Kearny, and Market Streets

and habits of transportation of customers was conducted. During the one-day study, 32,000 customers cast ballots indicating the means of transportation used by them on that day. Of the total of 32,312 patrons arriving at the stores, 60.2 per cent arrived in street cars, 21.8 per cent walked and 18 per cent came in automobiles. The figure of 18 per cent using automobiles is comparatively high, the report says, because a

TABLE SHOWING PATRONS ARRIVING BY VARIOUS MEANS OF TRANSPORTATION, BASED ON ONE DAY'S STUDY

	Department Stores		All Other Stores		Office Buildings		Banks		Restaurants		Total	
	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent
Walking	4,201	19.3	966	23.3	624	28.5	567	24.3	691	36.7	7,053	21.8
Riding on street cars	13,755	63.2	2,322	56.1	1,094	49.6	1,391	59.7	877	46.5	19,439	60.2
Arriving in automobiles, total	3,797	17.5	851	20.6	488	21.9	374	16.0	316	16.8	5,820	18.0
Arriving, parked at curb	2,300	10.6	562	13.6	316	14.3	231	9.9	185	9.8	3,594	11.1
Arriving in garage, driven by chauffeur	1,497	6.9	289	7.0	166	7.6	143	6.1	131	7.0	2,226	6.9
Total of all patrons	21,753	100.0	4,139	100.0	2,204	100.0	2,332	100.0	1,884	100.0	32,312	100.0

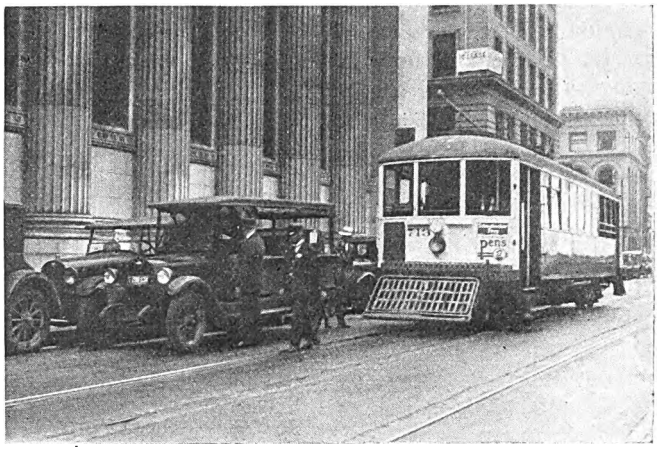
Digitized by Google

similar study conducted in Chicago shows that but 8 per cent of the patrons could be attributed to motor-car transport. Further, approximately one-half the motor car users, or 11 per cent of the total number of patrons interviewed, were able to park their motor cars at the curbs in the central district. In other words, curb parking still plays an important part in retail trade in San Francisco and severe restrictions on it should be proposed only with the greatest care. The survey has consequently recommended only such restrictions as are moderate and essential.

As to off-street storage of motor cars, the development of garage facilities in San Francisco is very encouraging. The storage garages within the district or closely adjacent to it have a capacity of 4,202 cars. In other words, the garage capacity already is more than 200 per cent of the curb space.

Temporary stopping of vehicles for loading and unloading merchandise is one of the essential factors in commercial traffic. The ease and speed with which this loading can be consummated is no small factor in the cost of commercial deliveries. San Francisco, unfortunately, is not well provided with alleyways making possible rear access to commercial houses. This necessitates an unusually large volume of merchandise transfer over sidewalks. This type of transfer is disadvantageous for the person making the delivery, and likewise to the public because of the interference which it offers to pedestrians.

Recommendations in the report, for parking control, include the prohibition of the stopping of cars at certain places except for the receipt and discharge of passengers or material, when the limit for passenger vehicles would be set at three minutes and of commercial vehicles at twenty minutes; the provision for loading zones wherever possible; continuing the 40-minute parking, and limiting parking in all business districts to one hour. Regarding the manner of parking, a provision is proposed which would permit parallel parking alone on the main street and angle parking only where indicated. To eliminate the undesirable practice of leaving cars upon the street all night a provision is suggested that parking for more than one hour between 3 a.m. and 5 a.m. be prohibited.

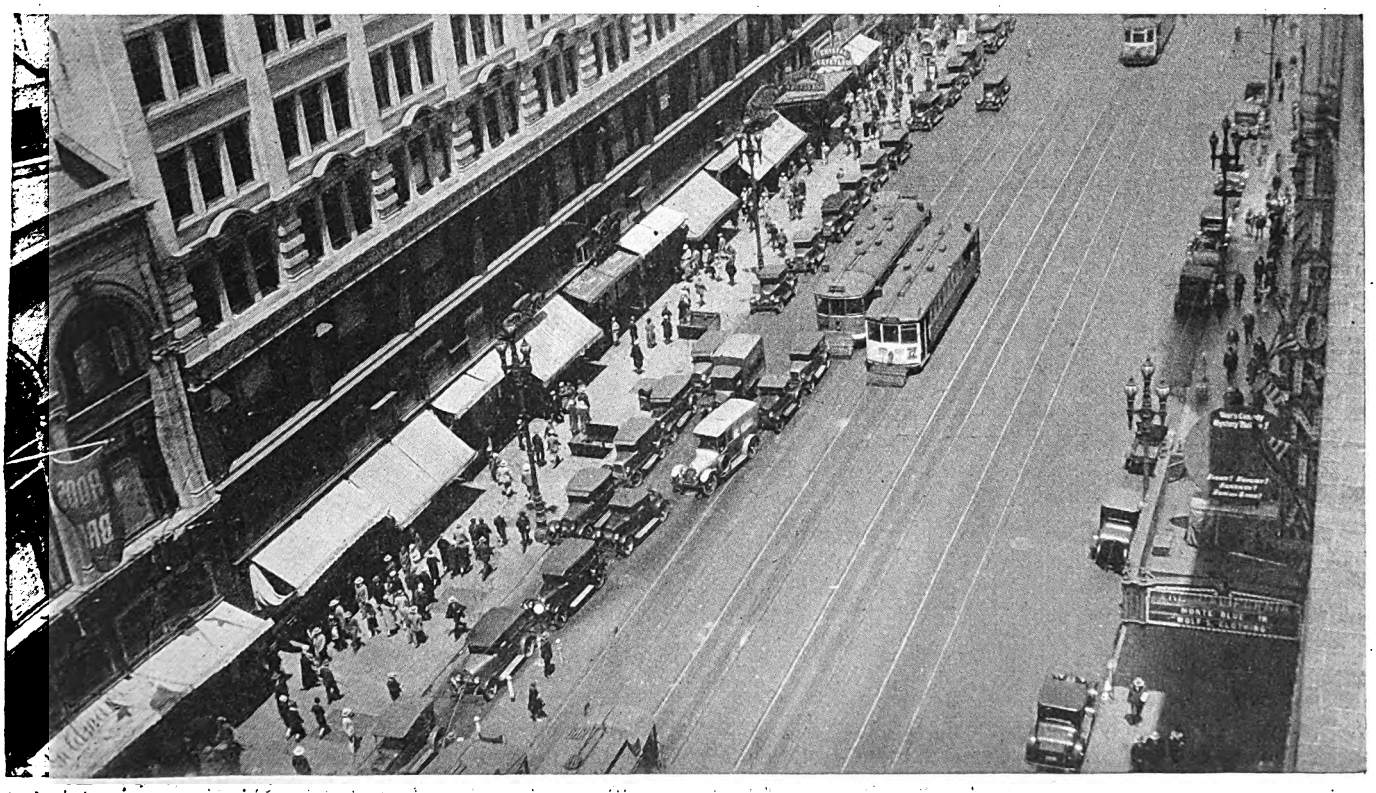


This view also shows the evils of double line parking in San Francisco

Signal Installation Program Recommended

All California cities are fortunate in having a uniform system of traffic warning and direction signs. These standard signs are so satisfactory that no general changes are recommended.

The present signal installation in San Francisco was started in 1922 and has been expanded to the point where it now covers twenty intersections in the central district, five along Van Ness Avenue and twelve elsewhere in the city. To assure a systematic signal policy for the city and maximum value from funds expended for



Examples of the evils of double line parking, as illustrated in San Francisco. Electric cars on the outside tracks of Market Street are being delayed from this cause

Digitized by Google

this purpose, a definite program of installation is recommended. The program may be divided into four parts in the order of their importance: Market Street, the remainder of the central traffic district, Van Ness Avenue, and outlying installations.

Market Street Problem Unique

According to the report, it is probable that there is no traffic artery in any American city which possesses more than a fraction of the complexities to be found on Market Street. The street is a key artery, acting as the principal collector and distributor for the important traffic from the north, west and south. Its physical characteristics are of the utmost irregularity. Practically all of the intersections are of the five-point type, making standard and normal control methods impossible. Not only are the intersections along the north side of the street irregular in their design but in their relation to the arteries entering the street from the south. The width of the street—120 ft. between property lines and 80 ft. between curbs—and the character of traffic add further to the difficulties of control.

It is also unusual among larger city thoroughfares in congested districts in that it has for its entire length through the central district, four tracks carrying short headway traction traffic, with frequent turns into and off of the street. A final element of complication is to be found in the varying character and volume of vehicular traffic.

Notwithstanding the many physical difficulties of Market Street the survey developed a control plan for this key artery of traffic which, it is claimed, will vastly improve conditions without costly physical alterations. The peculiar characteristics of Market Street were the determining element in the type of signal recommended. The survey advises the adoption of a three-light electric signal device designed to meet the charted control as set forth in special plans of control designed for seventeen intersections along Market Street. The design for one of these intersections is shown in an accompanying illustration.

For the protection of pedestrian traffic it was necessary to design a series of cross-walks for the entire length of Market Street. These were placed at the points of greatest demand for pedestrian crossing, at locations where the routes to the opposite curbs are shortest and where visibility is highest. Furthermore, it was necessary to co-ordinate the cross-walk locations with the street car stops to facilitate the movement of traction traffic, and to provide complete freedom for pedestrians who are crossing the roadways.

Progressive timing is recommended for all of the central district installations. The detailed plan for Market Street contemplates a potential speed of between 8 and 10 m.p.h. for the entire distance between the ferries and Van Ness Avenue, with not more than one required stop for vehicular traffic in this distance, and with a minimum of signal delay to traction units. The progressive control provides practically non-stop movement in both directions. Detailed plans were designed also for progressive control on other typical streets in the central district, and for Van Ness Avenue.

For pedestrian regulation on Market Street special pedestrian signals in addition to the regular vehicular signals will be required. This requirement is due primarily to, first, the irregularity of the intersections and the necessary location of the cross-walks, which makes it impossible in many cases for pedestrians in crossing at their designated places to have in view the signals which are placed for the control of vehicular traffic, and, second, the width of the street, 80 ft. between curbs, which requires a clearance interval of not less than fourteen seconds for the protection of pedestrians. Obviously, no system of pedestrian signaling will be satisfactory on any street if pedestrians crossing with the "go" signal are to be left stranded in the middle of the street in the midst of heavy traffic. Therefore, the recommendation is made that special pedestrian signals be installed in accordance with the special plan indicated in the charts for seventeen intersections along Market Street.

Recommendations Listed

The more important recommendations of the traffic survey committee fall into five well-defined classes: (1) installation and use of various safety and regulatory devices; (2) enforcement of law through the police department; (3) punishment of violators; (4) administrative organization for a more systematic handling of future traffic problems; and (5) a specific and balanced system of traffic regulations.

The first four of these classes were summarized at the beginning of the article in the issue of June 30. The fifth, which is in the form of a completed traffic ordinance, is presented in brief form on pages 12 and 13. Because of its length, a few sections and parts of the text of other sections were omitted.

World's Biggest Passenger Station at Melbourne, Australia

WERE one asked to name the biggest passenger station in the world, some prominent terminal of New York, Chicago, London, Paris or Berlin would come to mind. It will therefore surprise many that, so far as known, the premier passenger plant of the world is the Flinders Street Station, Melbourne, Australia. The following Melbourne figures, as well as the accompanying illustrations, are due to the courtesy of W. O. Strangward, secretary Melbourne and Metropolitan Tramways Board:

FACTS ABOUT FLINDERS STREET STATION AND VICINITY

Daily number of passengers	283,000
Daily number of trains arriving and departing	2,400
Daily number of street cars crossing the intersection of Flinders and Swanston Streets	3,312
Number of cars crossing the same intersection between 5.15 and 6.15 p.m.	529

A comparison on a 340-day basis with the biggest stations of New York, (see New York Transit Commission figures for 1926 published in Electric Railway Journal, page 780, April 30, 1927), indicates that Flinders Street Station certainly "out-busies" anything in New York, at any rate.

ANNUAL PASSENGER TRAFFIC (340-DAY BASIS)

Flinders Street, Melbourne	96,220,000
Hudson & Manhattan Terminal, Cortlandt Street	70,649,035
Pennsylvania Station	54,908,953
Grand Central Station	43,662,056

Accompanying illustrations show not only the Flinders Street Station but also specimens of the Victorian State Railway's splendid dining and observation cars, as well as a car and bus of the Melbourne system.

Maintenance Methods *and* Devices

Ignition Test Outfit*

By Charles Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

REPAIRING and adjusting the ignition equipment of buses by the men assigned to this work by the San Diego Electric Railway, San Diego, Cal., is facilitated by a test box with necessary instruments and a full line of tools. The accompanying diagram shows the connections for the equipment, and the halftone gives an idea of its arrangement in the box.

The $\frac{5}{16}$-in. spark gap gives a positive method for checking coils for defects. The condenser in the test set is used for comparing the condenser on a bus with a good one, to make certain that it is up to standard. Referring to the diagram, this is done by throwing switch *S*-2 to make contact with *B*. When thrown to *A* the test condenser is out of circuit. To operate the vibrator the switch *S*-1 is thrown to *C*. If an intermittent spark is desired switch *S*-1 is thrown to *D*. The knob of the switch must be pressed down each time to make contact, as with a telegraph key. An ammeter is used for checking the current in the primary winding of ignition coils, and the voltmeter is used principally for checking batteries. In making a voltage test the battery is given a load of at least 10 amp. for one minute previous to taking a reading.

A test bell which forms a part of the equipment is used for locating trouble. Test lamps are used on distributors with two breaker points, the object being to have both points make and break at exactly the same instant. In this test a piece of paper is inserted between one pair of contacts and the other is adjusted to 0.030 in., or not less than 0.025 in. The engine is cranked until the contact closes. One side of the lamp terminal is connected to the positive side of the battery and the other to the primary terminal on the distributor. Care is taken to disconnect the primary lead from the distributor. Then by turning the engine slightly either way the lamp will be lighted or extinguished. The point is found where it will just light, and then the paper is transferred to this contact. Without moving the engine the other contact is adjusted until it will just light the lamp. With a little experience accurate adjustments can be made quickly with the test outfit.

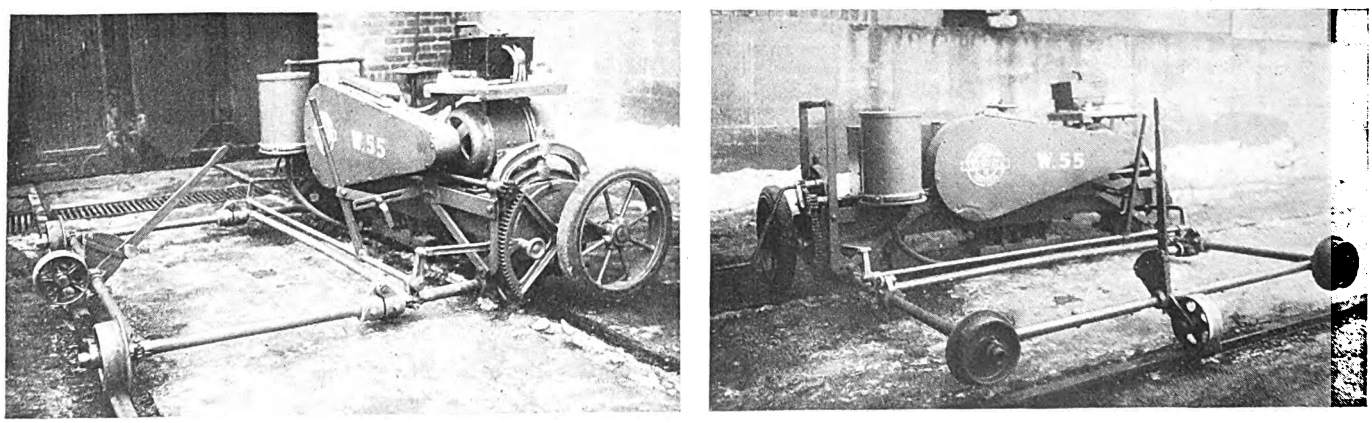
Lifting Device for Track Grinder*

By J. Mercier
General Foreman Track Service Division, Montreal Tramways, Montreal, Canada

USUALLY a track grinder is too heavy and unwieldy to be wheeled readily from the rails by one man. As one man can run the machine, it is a distinct advantage, particularly where headways are short, if he can roll the grinder off and on the track alone. A simple device was constructed by the track service division of the Montreal Tramways by which one man can lift and roll a Vulcan grinder rapidly from the track in half the time ordinarily taken by a crew of two men.

The device is shown in the accompanying illustrations. A star wheel of 8-in. diameter and $2\frac{3}{4}$ in. wide is mounted on a 1-in. axle. This is attached to the lower end of a lever 2 ft. 6 in. long, which is bent at an angle of 135 deg. at a point $5\frac{1}{2}$ in. from the lower end, a boss being

*Submitted in Electric Railway Journal Prize Contest.



A lifting device that allows one man to run a track grinder

At left, the grinder is in normal position on the track; at right, the small wheel carries the weight so that the grinder may be rolled free of the rails

Digitized by Google

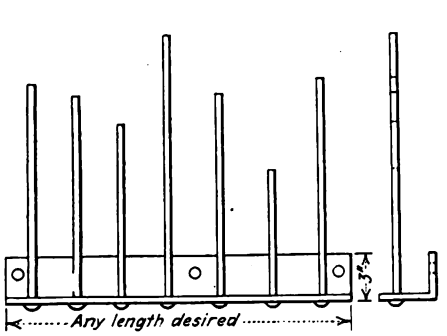
welded on at this point to revolve on the horizontal rod which connects the two flanged wheels of the grinder. On one side a collar held by a set screw keeps the lever in place, and on the other it presses against a sector plate also held to the horizontal rod. This sector plate has two holes placed 6 in. apart, and so located that a spring latch pin on the lever will drop into one or the other as the lever is turned about its fulcrum.

With the lever in the lower position the small wheel is free of the road surface and the flanged wheels roll on the rail, holding the machine in correct position for grinding. By lifting the latch pin out and pulling the lever upward the small wheel is lowered to the roadway and the flanged wheels are lifted clear of the rail. The pin drops into the upper hole in the sector plate to hold the lever in position so that one man can push the grinder clear of the track. When it is desired to put the grinder back on the rails the action is reversed.

Material Storage Rack Prevents Waste

LOSS of such small material as nuts, lock washers, bushings, flat washers, etc., has been prevented in the shop of the New York, Westchester & Boston Railroad, Westchester, N. Y., by the use of a rack for the storage of this small material. The rack consists of a piece of 3-in. angle to which a number of $\frac{1}{4}$-in. to $\frac{5}{8}$-in. round rods have been welded. This angle is bolted to the shop wall. The shop mechanics and sweepers were instructed to salvage all of this material found upon the floor and place it on these rods according to size. This material is consumed before any new material is withdrawn from the storeroom.

The saving in this material through the plan has been very noticeable.

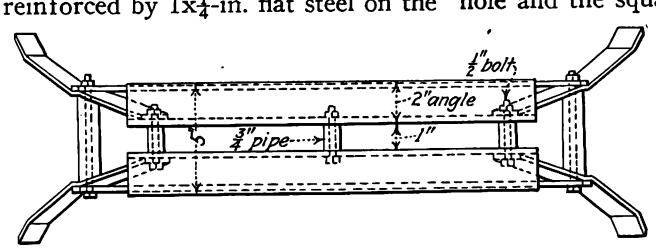


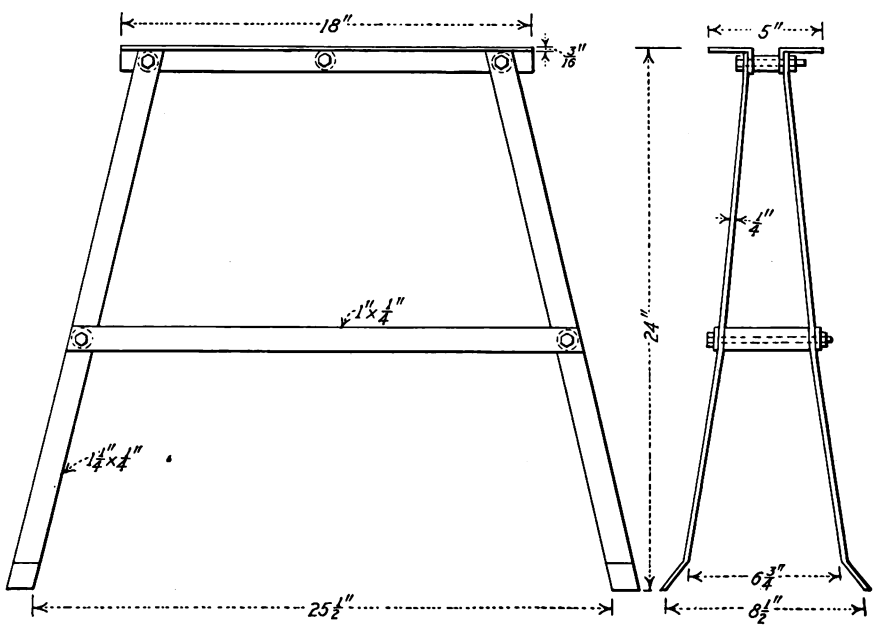
Rack for nuts, washers and small material

All Steel Portable Horse

REPAIRING of horses in the shop of the Richmond Railways, Inc., Staten Island, N. Y., was a large item in the annual expense of maintaining the shop equipment until all-steel horses of the type shown in the accompanying sketch were adopted. These were designed and manufactured in the shop. These horses are used in various departments and occupy a floor space of $8\frac{1}{2}$x$25\frac{1}{2}$ in. They are constructed of angles and bar steel, and the over-all height is 24 in. The top is made from two 2x$\frac{3}{16}$-in. angles bolted together and spaced 1 in. apart. Three pieces of $\frac{3}{4}$-in. pipe 1 in. long form the spacers. The legs are made of $\frac{1}{4}$x$1\frac{1}{4}$-in. flat steel and are bolted to either corner of these angles. The top of the horse is 18 in. long and 5 in. wide, and the over-all base dimension of the feet is $25\frac{1}{2}$x$8\frac{1}{2}$ in. The flare of the legs gives a firm footing and prevents over-balancing. The legs are reinforced by 1x$\frac{1}{4}$-in. flat steel on the front and a $\frac{1}{2}$-in. bolt passing through a $\frac{3}{4}$-in. pipe spacer on each end.

These horses have been found portable, strong and light to handle. The expense for maintenance has been negligible.





Strong steel horses used by Richmond Railways, Inc.

Brake-Adjusting Tool

MAKING an adjustment of the truck dead lever in the dead lever rack was a slow and tedious job in the shop of the New York & Queens County Railway, Long Island City, N. Y., so the tool illustrated was designed for this purpose. It consists of a flat offset bar 29 in. long, forged from $\frac{1}{2}$x$1\frac{1}{2}$-in. stock. A $\frac{3}{4}$-in. square pin 2 in. long is welded to the flat surface of the bar near one end. A $\frac{3}{4}$-in. round pin 1 in. long is also welded to the bar on the same surface. These pins are spaced at $3\frac{1}{4}$-in. centers.

Tool for adjusting truck dead lever

This tool is very simple to use. The round pin is inserted in a rack hole and the square pin is placed behind the dead lever. This provides a fulcrum and sufficient leverage to make any adjustment with a minimum of manual labor.

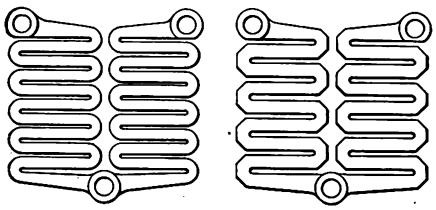
New Equipment Available

Change in 8-In. Resistor Grids

STANDARD 8-in. three-point suspension resistor grids of the Westinghouse Electric & Manufacturing Company have been redesigned to improve ventilation, reduce localized heating, increase mechanical strength and to facilitate manufacturing. The mechanical interchangeability of the grids is not affected, as they still come well within the outline dimensions of the end frame. The important clearances are therefore unchanged.



Changes in design of 8-in. resistor grids At left, old style; at right, new style

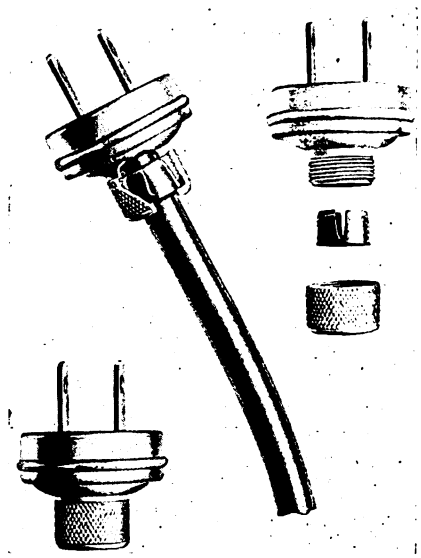
Electrically the improved grids are also interchangeable with previous ones, as the resistances of the various styles remain unchanged. In a few the continuous and intermittent current ratings have been increased. Each individual grid of the improved design is interchangeable with the one of the old design of the same style number.

Improved Grip for Attachment Plug

SHORT-CIRCUIT hazards are lessened, it is claimed, by an unbreakable attachment plug cap with an improved type of cord grip announced by the Cutler-Hammer Manufacturing Company, Milwaukee, Wis. The cord grip acts as a positive strain relief. Fastening of the cord grip is extremely simple and can be done without tools as it is necessary only to screw down the knurled collar.

The collar wedges a fiber bushing tightly against the cord. Parts are so designed that a natural pressure from the inside prevents loosening of the knurled collar and insures a firm grip. A fiber grip bushing serves to insulate the cord from metal parts and prevents damage to the cord. This bushing also acts as a clamp and is the only part that actually touches the cord.

The cap is the same as the unbreakable "Dreadnaught" line of caps made by the company. A rustproof armored shell made of heavy brass prevents breakage when dropped. Sheet bakelite is used to hold the blades firmly in place.



Cord grip plug cap

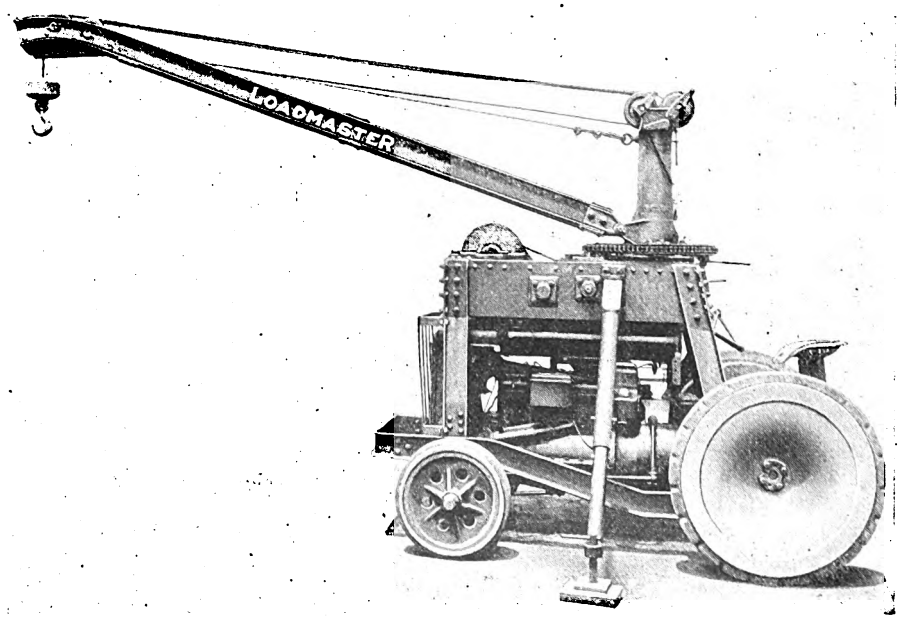
Small Swinging Crane

DESIGNED to meet the growing need for a small locomotive type crane in storage yards, repair shops, warehouses, machine shops and garages, the Loadmaster swing crane is offered by Frederick H. Poor, Inc., New York, N. Y. It is capable of easily handling loads which cannot be advantageously handled by manual labor, which are either too small to justify the installation of large crane units, or loads which, by reason of their location, are not within reach of ordinary hoist service.

To provide stability specially weighted wheels are employed at both rear and front to counterbalance loads in suspension from the boom; and broad tires upon these wheels sustain the loads without undue tire loading. The frame upon which the mast is located consists of a fabricated plate and channel structure secured at the rear to the axle-housing of the tractor, and is suspended at the front in such a way as to compensate for irregularities in the floor or roadbed over which the machine travels.

The hoisting drum is connected directly to a self-locking worm gear, and is operated from the power take-off, through a clutch and bevel pinions by a control lever within easy reach of the driver. When the drum is not in motion the self-locking worm gear holds the load in suspension on the boom without use of friction brake.

The swinging boom is constructed of two steel channels braced firmly together, and equipped with necessary sheaves and hook weight. The "bull wheel," by which the boom is swung about the mast, is power driven by means of chain and sprocket, and is equipped with an expanding brake of design such that the boom may be controlled in its swing, or, when not under power, may be set in any fixed position. Adjustable telescoping outriggers allowing heavier loads to be swung over the sides will be furnished at extra cost. These outriggers may be folded alongside the machine.



Swinging crane of the small locomotive type

Association Activities

C.E.R.A. Takes Stock of Present and Future

IT WAS quite generally agreed among the 200 members of the Central Electric Railway Association attending the two-day convention held at Cedar Point, Ohio, June 28-29, that to classify the electric railway men of the Middle West simply as optimists or as pessimists was to deny the less fortunately situated of the transportation fraternity due recognition of their avowed determination to bring their properties through the difficult period of declining revenues to more prosperous times.

Two exceptional analyses of the trend in railway business were provided in papers by Charles W. Chase, president Gary Railways, Gary, Ind., and by Harold V. Bozell, Bonbright & Company, New York City. The conclusions reached by Mr. Chase in his discussion of the future for interurban and city railway lines so closely checked with those expressed by Mr. Bozell in his observations of the industry from outside its ranks as to gain added significance from their joint agreement.

Both speakers expressed the opinion that there prevailed a feeling that as a business the electric railway industry has been in much worse throes than it is now; that while considerable remains to be done in securing more traffic, the industry is apparently on the upgrade once more. Electric railways, both men agreed, have been the victims of such factors as the psychology of the fixed 5-cent fare, the load of burdensome and misplaced taxation, the enormous increase in paved streets, the unanticipated increase in the number of automobiles, and in some localities, still, unrestricted competition from buses.

The conclusion is forced, said Mr. Chase, that for an indefinite period the electric railways must look for only a moderate increase in revenue; that the principal hope of betterment lies in devising ways and means of reducing expenditures where such can be done without impairment of necessary and justifiable service. That traffic now using automobiles and motor transportation can be induced to return again to the electric railways has been shown by the successful rejuvenation of some of the electric lines in the Middle West territory.

One very definite thought which occurs to many people analyzing the railway industry today, according to Mr. Bozell, is that the principal competitor of the electric railway is the private automobile. In considering the probable extent of the increased use of highways for shipment of both passengers and freight by commercial carriers it is well to bear in mind, said Mr. Bozell, that the system of hard roads which is being rapidly extended throughout the country was made possible by the demands of the private car owners. Just how far these roads may be pre-empted for commercial hauling without producing a popular reaction and consequent restriction of their use, must not be overlooked in considering the relation between railway and highway transportation of the future.

President W. S. Rodger, general traffic manager Detroit United Lines, in his address opening the Thursday morning session, urged the need for smooth roadways and comfortable cars comparable with the best vehicles supplied by competitive lines of transportation. Continuing, Mr. Rodger said that while it is true revenues in some territories show a decline, it is no more than is reflected in the general business of the company by the drop in steam road revenues and car loading figures. Changing conditions will cause setbacks here and there at times, but everything tends to show that under properly regulated competition the electric railway has a field of its own which is certain to prevail where satisfactory service is rendered. Unreasonable competition can only be kept at a minimum or eliminated by maintaining proper relations with the various communities, the governing bodies, the public, and the newspapers.

Thursday's session was enlivened by an unusually spirited discussion of the problems confronting the industry. Those contributing to the discussion included F. D. Carpenter, president Western Ohio Railway & Power Corporation; H. A. Nicholl, general manager Union Traction Company of Indiana; J. F. Collins, general manager Michigan United Lines; J. M. Pogue, general manager Indiana, Columbus & Eastern Traction Company; George R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway; W. H. Sawyer, president Stevens & Wood, New York City; Charles Gordon, editor ELECTRIC RAILWAY JOURNAL; H. A. Cowgill, manager Ohio Public Service Company; R. N. Graham, manager of railways Penn-Ohio Electric Company; C. L. Van Auken, managing editor *Electric Traction;* Charles H. Jones, general manager Chicago, South Shore & South Bend Railroad, and F. H. Wilson, vice-president and general manager Cleveland Southwestern Railway & Light Company.

Clinton D. Smith, superintendent of personnel Cleveland Railway, in his paper on employee welfare emphasized that industrial relations work is prompted by a recognition that the employee, particularly the trainman, is the "key man" in establishing and maintaining a sales contact with the public. We have observed, said Mr. Smith, that the sale of the automobile, the radio, telephone service, and other commodities and services have been in some ratio to the quality of salesmanship exerted. Patronage is not an item of chance. The present traffic does not consist merely of those who have to ride. A definite ratio exists between the amount of traffic and the type of car, coach, condition of roadbed, schedule speed and personal service. However, the greatest attainment with any or all of these factors favorably disposed will be disappointing if we slight the development of the salesman, if we fail to establish a sales division in our railway organizations for the purpose of giving specific sales instruction to our trainmen. Throughout his paper Mr. Smith laid especial emphasis on the idea of specific sales training, asserting that a general welfare or personnel routine pursued with an indefinite program will not produce salesmen. He granted that it is impossible properly to organize a sales division without special consideration to employment and welfare, as well as accident prevention. The latter

especially is so interwoven with good salesmanship, said Mr. Smith, that in his opinion any sales training must include the elements which are responsible for a reduction in accidents. The best salesmen are likely to result from the careful selection of employees by the employment division, sufficient training of these new men, the promotion of practical welfare work, and specific sales instruction for all trainmen. Outlining some of the organization details of the proposed sales division in his own company, Mr. Smith reiterated that the first concern is to make a business family out of the official organization. A feeling of suspicion and frequent misstatements of facts will result if any employee is left to his own conclusions on company policy. There must be a coordination of effort to obtain the prestige that should be attached to the various positions held by "key men." Concluding, Mr. Smith declared that while volume of traffic has increased on some properties the improvement for the industry as a whole does not cause complete satisfaction; that while considerable progress has been made in the physical plant, in speeding up schedules, etc., corresponding strides in sales activities have been lacking. "We must cast aside any negative attitude, cease telling how the transportation industry differs from all others and urge that our railway associations, in particular, make special research on the problem of definite sales instruction for transportation employees.

Making Salesmen of Trainmen

R. N. Graham, manager of railways Pennsylvania-Ohio Electric Company, Youngstown, Ohio, discussed the education of the platform employee in salesmanship, pointing out the analogous relationship between the type of salesmanship needed by the trainman and that used by the hotel employee. In Mr. Graham's opinion salesmanship as expressed by the trainman is almost wholly a point of view. If the platform man has it firmly fixed in his mind that the relation of the passenger to the company is determined by his own dealings with the passenger, and that his own prosperity and his job depend on that relationship, then the best salesmanship, so far as the trainman is concerned, is achieved. "I would not measure the efficiency of platform employees as salesmen by their active capacity to sell some intrinsic article or by their ability in arguing controversial questions in which the company is interested, but solely by the reaction that they produce upon the passenger in carrying out their duties," concluded Mr. Graham.

Of considerable interest among the committee reports which occupied a portion of Friday morning's program was the one made by L. G. Tighe, assistant general manager Northern Ohio Power & Light Company, Akron, Ohio, and chairman of the committee on the promotion of more profitable business. The report comprised a detailed résumé of conditions existing on Middle West railway properties with information concerning the efforts being made by the different companies to encourage more passenger and freight business. A brief summary was made of the factors deciding the abandonment of the interurban division of the Northern Ohio Power & Light Company between Akron and Canton and the substitution of a fleet of Twin Coaches to handle the traffic.

Entertainment features of the sessions at Cedar Point included a banquet Thursday evening, golf and baseball games both afternoons of the two-day meeting, and bridge for the attending ladies.

The next convention of the association will be held in Indianapolis, Ind., Jan. 24-25.

A.A.A. Motor Bus Division Meets

CINCINNATI was the center of interest to bus operators when the Motor Bus Division of the American Automobile Association held its annual meeting at the Hotel Gibson in that city, June 27-30. Welcomed to the city by the Hon. Murray Seasongood, Mayor of Cincinnati, the delegates and visitors made up in interest and enthusiasm for what they lacked in number. An interesting program of business and entertainment had been provided and the meetings were distinguished by the high character of the papers presented and by the discussion which followed. A. M. Hill, chairman of the Motor Bus Division, presided and was ably seconded by John M. Meighan, secretary. An official tone was imparted to the gathering by the presence of R. O. Self, motor bus commissioner of North Carolina; W. W. Goodwin, motor bus commissioner of South Carolina; and Judge F. A. Sanders, bus supervisor of West Virginia.

In his address of welcome Mayor Seasongood spoke of the difficulties that were confronting bus operators and expressed the opinion that federal aid alone would solve the vexing question of interstate operation. In presenting the report of the legislative committee S. A. Markel detailed the numerous meetings that had been held and the appearances made before various public service commissions and legislative bodies in an effort to iron out the perplexing questions of interstate operation, restrictions as to dimensions, fees, etc. He expressed the opinion that legislative work constituted the major activity of the Bus Division.

Opposition to the Parker bill as at present pending before Congress and as supported by the Bus Division appears to come principally from the N.A.C.C., and the activities of this organization in obstructing the passage of the bill were the subject of a bitter denunciation by Mr. Markel.

Responding for the N.A.C.C., E. F. Loomis, secretary of the bus and truck division of that organization, defended the position taken but expressed belief that differences could be adjusted in conference. The N.A.C.C. takes the view, according to Mr. Loomis, that bus operation should and can be a monopoly, but that Congress should not have to consider economic questions as to the equities of rail and trolley as predominant factors in regulation.

In spite of certain onerous restrictions and vexing regulations it was the sense of the meeting that the bus had, in most cases, received very fair consideration and that it had thrived under regulation of state commissions. The future of the industry, according to those present, is dependent upon a continuance of this spirit.

In presenting the report of the committee on equipment development, Chester Moore, secretary Illinois Motor Bus Association and Eastern representative of the Pickwick interests, drew attention to the advance that the past year had brought about in refinements of body design. Fred Klock presented the report of the committee on uniform specifications. It was the opinion of the committee that rules should avoid limiting width and length of vehicles and that future legislation should permit of such flexibility as would encourage rather than retard the development of the art. That bus men are already confronted with the problem of the free or reduced-fare rider was emphasized in the report of the clergy bureau. In view of the fact that certain practices had already developed which it would be difficult to abolish, it was decided to take no official action but to leave matters to the discretion of the individual operator. The committee on schedule information and terminal development reported that great advances, particularly in the appearance and make-up of time-tables and the dissemination and better arrangement of schedule information, are being made.

At the noon luncheon, held at the Hotel Gibson on the first day, a paper entitled "The Motor Bus—a Specialistic Transportation Unit," was presented by Frank R. Fageol, president Twin Coach Corporation, Kent, Ohio. Mr. Fageol cited the progress of the bus during its comparatively short existence and predicted that its economic use would continue to increase.

Howard F. Fritch, president Boston & Maine Transportation Company, Boston, Mass., set forth in his paper at the afternoon session how bus service of his company was being successfully coordinated with the railroad service of the Boston & Maine Railroad, the parent company.

"Equipment Maintenance and Its Importance in Bus Operation," was the subject of a paper by A. E. Hutt, analytical engineer Vacuum Oil Company. Mr. Hutt stressed the value of lubrication as "preventive maintenance" and outlined a system for motor coach maintenance, based on practices employed by many successful operators.

On Wednesday evening those in at-

Digitized by Google

tendance were guests of the Cincinnati Motor Coach Association at a banquet, held at the Hotel Gibson.

The Thursday morning session opened with the presentation of a paper on "System in Motor Bus Operation," by Guy A. Huguelet, president Consolidated Coach Corporation, Lexington, Ky. In addition to explaining the duties of the various officials and committees of his company and the organization of each department, Mr. Huguelet described in detail the system's safety department and emphasized the importance of safety work in bus operation.

The paper of E. Blythe Stason, professor of law, University of Michigan, on "Commission Control Over the Certificate of Convenience and Necessity," told in detail of the intricacies of the very complicated and perplexing legal phases with which the state public service commissions are constantly confronted. Professor Stason indicated the nature, source and general limits of the power given commissions to control the certificates, pointed out the importance of a fair and scientific development of the rules of law under which commissions exercise their power and showed by actual cases some of the problems met in the development of these rules.

Edward A. Keenan, advertising manager Philadelphia Rapid Transit Company, in his paper "Merchandising the Bus Business," explained the methods employed by his company in promoting traffic on its bus tours and pointed out that almost 4 per cent of the total estimated receipts from bus operations are being set aside for advertising. His talk was illustrated by samples of billboard and poster advertising used by his company.

The American Automobile Association sponsored a luncheon for the delegates on Thursday. At the final business session of the division on Thursday afternoon, Arthur M. Hill and John M. Meigham were re-elected chairman and secretary of the division, respectively. In the evening the delegates assembled for an informal banquet. The remaining two days, Friday and Saturday, were devoted to various forms of entertainment, including several sightseeing tours.

Organized Safety and the Electric Railways*

By F. C. Lynch
Director Kansas City Safety Council

WHERE the accidental death rate in an industry has been reduced more than 50 per cent in a period of fifteen years, it might seem needless to present any further arguments for an increased participation in organized safety work. However, with the personal injury and property damages running as high as 40 to 50 per cent of the legalized net earning, we can still afford to give some thought to the relation of organized safety to the electric railway industry.

In the organized safety within the industry itself, we find two general classifications for consideration, the maintenance department and the transportation department. In the maintenance department, safety can be introduced by adopting the principles which have proved so effective in industrial plants. The introduction of safety into the industrial end of the organization improves the relationship between the men and management. It affords a common ground where both can meet with the same objective in view and one where the benefits will be shared alike. The efficiency of the organization will be increased because the attitude of the men will be better. Organized safety means a more scientific analysis of the job each workman is to do and includes the proper education of the workman in his particular duties and responsibilities. The increase in efficiency will bring the third result of safety—cost reduction. The reduction in costs is not alone due to increased efficiency, but also to the reduced compensation payments and the losses which accidents contribute. It has been estimated that the indirect cost to a shop from an accident is four times the direct cost of compensation and medical expense.

For safety work in the transportation department the basic principles are the same. Usually the men on the cars are more receptive than the men in the maintenance departments since hardly an hour passes in their daily routine but what they see the need and the effect of accident prevention. With the platform men there is an increased efficiency in the manner in which the work is performed, a reduction in the cost not only in the direct compensation and medical expense, but in the elimination of indirect charges and costs such as interruptions to service and the loss of the use of the equipment and the operator's services.

The management should keep in mind that safety work is unlike most progress in that it must begin at the top and work down through the organization. Likewise, the management should not forget that it must establish the right to make the appeal for co-operation from the men before the appeal is made by analyzing its problems, planning its campaign, and performing the preliminary work of furnishing safe equipment and safe operating regulations.

Just as the differences between the men and management are more easily eliminated when an opportunity is provided of meeting upon common ground to discuss their respective problems, so the electric railways by supporting the local safety council are able to establish an avenue of contact with the public in which no prejudice exists. A local safety council, properly organized, is governed by a board of representative citizens. The investigations and recommendations furnished this board of governors are produced by special committees upon which are represented every phase of civic life.

Educating the Public a Big Task

Most students of accident prevention have unanimously agreed that in public safety work the principal task is educating the people so that they will properly recognize and avoid hazards. The steam railroads for some time have had their representatives visit schools and talk to the children on the subject of community safety, emphasizing the matter of trespassing upon the steam railroad property. However meritorious this work may be, these men are working against the resistance which is set up in the minds of the audience by the realization that they are promulgating this idea for selfish purposes.

Contrast that scheme with the plan which is used in a city having a local safety council. The street railway presents its problem to the safety council. This is immediately referred to the children's activities committee, which is made up of about 50 per cent representatives of the Board of Education with the balance of the committee being composed of representatives from the Parent-Teacher Association and business men. Through this committee, the message is taken to the children by the school teachers in a prepared course of instruction in safety which is used as a guide in teaching accident prevention work. There is no resistance as the children quickly realize that the sole purpose is to protect them from possible injury. In submitting this problem, the committee quickly realizes that the benefactors are not the electric railways but the children and their parents. This same problem receives a favorable position in the press, because when it is presented by the children's activities committee the editors quickly realize that they have a moral responsibility in the protection of the children of the city and they are quick to recognize it. Their participation in the work is a very definite contribution towards the successful accomplishment of the program.

Street Safety a Real Problem

There is no problem confronting the electric railways today any greater than the problem of street capacity and street safety. This matter of street safety is of course one in which the safety council is primarily interested and, inasmuch as it is so closely related to street capacity, both are receiving constant attention. There has been no one item which has contributed so greatly towards the street safety and street capacity as the establishment of safety zones. At the same time, there

**Abstract of a paper presented before the Midwest Electric Railway Association, Kansas City, Mo., June 4-6, 1928.*

Digitized by Google

perhaps is no other practice which is as much misunderstood as is this particular one. There are many people who look upon the safety zone as something which is established for the benefit of the electric railways. It does little good with these particular people to point out to them that safety zones are for pedestrians and are even established on streets where there are no street cars. With a safety council's traffic committee, composed of representatives of the administrative, legislative, enforcement and judicial branches of the city government, together with representatives from the park board, transportation corporations, the Automobile Club, the Merchants' Association, Real Estate Board, and a group of eminent engineers recommending the establishment of safety zones, it is obvious that the public will accept these recommendations in the light of safety regulations, not as special concessions to the electric railway industry.

The electric railway industry has long since realized the inequitable regulations which require street cars and motor vehicles to obey, traffic control signals and at the same time permit the pedestrian to move with an utter disregard for such signals. The traffic committee of a safety council opens up an avenue where such questions and needs may be presented without incurring the ill will of the public. In this type of safety campaign, the street railway is able, through the safety council, to take the position of a public benefactor rather than the position of an agitator for additional regulations.

The humanitarian appeal of this work together with the advantages which your participation will bring, are sufficient to justify support of an organized safety movement. Accidents do not happen, they are caused. By removal of the cause you prevent the accident. Some of the industries have reduced their accidents as much as 90 per cent over a period of fifteen years. The same opportunities exist in public accident prevention work. Would it not be immensely worth while to reduce personal injury and property damage charges by 10 or 20 per cent and credit this to the profit and loss ledger, if by so doing we could win the good will and support of the public and speed up our schedules?

Rigid Track Construction*

By A. E. Harvey
Superintendent of Construction Kansas City Public Service Company, Kansas City, Mo.

IN DESIGNING a modern paved track there are three important points to be considered:

A foundation amply sufficient to carry cars and trucks of maximum weight.

A track that will have the longest life.

A pavement of such material as is most satisfactory for use in car track areas.

These three points should be combined in such a way that there may be no movement of one part in relation to the other. Movement is bound to produce fractures and openings permitting wear, the entrance of water, increasing maintenance costs, and eventually the disintegration of the entire structure.

In the design of paved track probably the most important question is whether it should be rigid or resilient. If track is made resilient there must be some movement of parts in relation to the others, thus sacrificing permanency. A ballasted track which is resilient and, in many cases, flexible, may be considered as constructed in three layers: the ballast, upon which is laid the track, and the pavement which is placed on top of this. In this kind of track much dependence must be put on a heavy bed of ballast well tamped, and on the stiffness of the rail, calling for heavy sections 7 in. or 9 in. deep. A greater depth of structure is required and more material and labor than to secure equal stability in track built in solid concrete.

The solid or rigid type of track consists essentially of a concrete beam of the width of the track, reinforced with rail and steel ties. Such a structure gives a more even distribution of the loads upon the subgrade, and a greater beam strength with less depth of concrete and rail than in the ballasted track, making a saving in cost of rail, excavation and ballast without sacrifice of strength or permanency.

Careful consideration should be given in the designing of this type of construction to the detail of the various parts that go to make up the track proper. The rigid or monolithic construction does away with the necessity of a high rail section designed to secure stiffness, and paving practices are being adjusted to the use of rail of lower sections. Where the general design of the track permits, the low sections of T-rail have a decided advantage on account of lower cost and because the rail head is generally deeper, giving a longer wearing life.

Ties have been the most perishable part of a track structure, so that in their selection the most permanent material should be specified. Wood ties should be either of white oak or, if more perishable woods are used, they should be treated. In the use of solid concrete the importance of a tie or bearing is largely eliminated, as the bearing is largely concentrated under the rail, so that steel ties are better adapted to use in solid concrete than are wood ties.

Two points should be considered in the designing of a steel tie: a large bearing area between the tie and concrete and a secure method of fastening the tie to the rail. It must be kept in mind that the rail must not only be held up against the load but that it must be held down securely. The failure of ties, whether of wood or steel, is generally due to the rail cutting into the tie. This can be prevented only by the most rigid fastening.

Bad joints have been the curse of track since the beginning. Paving of tracks has only multiplied the trouble. The designer of a modern track may have the choice of many improved joints, but there is but one complete answer for this trouble; eliminate the joint and make the rails one. For general use the thermit weld appears to be the most practicable both from convenience of installation and results. There are a number of other joints of the seam-welded type, but in the strictest sense of the word they are not welded joints because the joint is not eliminated, plates being used and secured by seam welds to the rail instead of by bolts.

Proper drainage of the subgrade must not be overlooked. Whenever there is any question as to accumulation of water a drain tile should be installed beneath the ballast or slab. This is most important in stone ballasted track, as there is a greater liability of the entrance of water through the paving on such structure.

An equally important feature of good track construction is the final work of placing the concrete and paving. Only the best stone and sand should be used. Bad aggregates will give poor results. Concrete should be mixed in as large a machine as practicable and turned the full time specified. The last few turns of a mixer have much to do with the final strength and the workability of concrete.

Concrete must be thoroughly tamped as it takes its initial set to give a full bearing under not only the tie but the full length of the rail. No matter what the consistency, concrete will not flow naturally under these surfaces and give a complete bearing. If left untamped or tamped too soon it will shrink away from such surfaces; however slight this shrinkage is, the bearing will be incomplete, permitting movement and resulting in cracks and crevices for the entrance of water.

Whatever the form of pavement, it should be laid in a plane with the top of the rail. Crowning results in heavy shock to pavement and track where heavy loads cross at high speed. The impact of a heavy load will in a short time cause breakage in anything but the heaviest pavement and foundation and will also produce a blow upon the rail, which, if transmitted through the rail and tie without similar pressure or blow upon the pavement, will separate the track in a downward direction from any paving structure that lies above the base of the rail. The only variation from this practice that should be made is, first, that the pavement on the outside of the rail should be low enough so as not to form contact with the tread of any worn wheel that is wider than the head of the rail; second, that the flangeway where T-rail is used should be made

**Abstract of paper presented before the Midwest Electric Railway Association, Kansas City, Mo., June 4-6, 1928.*

Digitized by Google

only of such width as will accommodate the flange and of such contour as will free any material lodged in the flangeway and permit it to be pushed up and out of the way by the passing wheel.

Where tram sections of rail are used the bevel on the outside edge of the rail prevents any damage that might occur on account of the worn treads. On the gage side of the rail the paving material must necessarily come flush with the top of the lip of the tram. This leaves a difference in height of pavement and the top of the rail on the outside edge to the amount of the chamfer on the edge of the rail and the top of the lip of the tram on the gage side. This is a variation which still exists and may be the cause of a blow under heavy loads but it will be small and need not be considered as serious. It can only be removed by making extensive changes in rail sections.

A study of practices of the more important properties show a decided increase in the use of solid concrete construction and steel ties and in the use of concrete pavement. The fact that some of the early construction along this line gave indifferent results was due to lack of experience, information, specifications and workmanship. The decided trend of the past few years toward the use of this type of construction is an indication that these matters have been largely solved. It is too much to expect that there will be a definite standard of track construction adopted by any association, but the indications are that the modern track constructed in the next few years will be along the lines described.

Economic Aspects of Renewal Parts Problem*

By E. C. Brandt
Assistant Works Manager
Westinghouse Electric and Manufacturing Company

SOMETIMES renewal parts are furnished at normal cost for six months, and then at a little higher cost as time goes on. Certain automobile manufacturers replace parts for seven years at a normal cost and from then on at extra cost; other corporations furnish maintenance and renewal parts for any apparatus which they have ever built and which is still in service.

Several years ago, the service to our customers in supplying maintenance and renewal parts became one of our major considerations. A selected group of men, who were acquainted with the company's apparatus, its development and progress over a period of years, made a complete study of this situation. They had all the company's records of the apparatus sold, its users, etc., together with the past sales records showing the parts purchased, engineering data and tests, and the approximate life of every wearing part. They also had a complete analysis of what the user manufactured himself, purchased from other suppliers and what they purchased from our company. This made it possible for the group to estimate the total production and requirement of each individual part for all equipment which was in service.

Several types of equipment were classified, namely—current apparatus, or that which is up to date and of the very latest design and is in production at the plants; non-current apparatus, or that which is in service by our customers, giving good service and still having a long time to operate but requiring maintenance and renewals; and obsolete apparatus which is no longer economical to run and has been scrapped, or should be scrapped. The latter two classifications are the ones for which the Westinghouse renewal parts plant is supplying parts for today.

The group that studied this situation made the recommendation that a plant devoted exclusively to the manufacture of these parts should be erected. With the information available it became a comparatively easy problem. The Westinghouse Company is now in a position to produce by a group of skilled workmen, engineers and plant supervisors, renewal parts for any Westinghouse apparatus still in operation. We are promoting the idea that the original manufacturer should furnish all renewal and maintenance parts and service his own equipment so the customer will obtain the best results and maximum output at all times.

The maintaining of stock for renewal and maintenance parts was given considerable thought and study. This was arrived at from records which had been kept for years and in this way knowledge was obtained and a minimum available stock established. Parts were manufactured in the largest quantities possible in order to obtain the very best cost; other parts had to be built on special orders due to their activity not being high enough to warrant manufacturing in quantities for stocking purposes.

Based on our past experience and by having activity records we are able to carry a stock of parts either at the manufacturing works (whose stocking facilities are limited) or in the district or zone warehouse, where immediate shipment to the customer can be made. However, in the case of special parts required by any customer, the order is immediately referred to the manufacturing plant and every effort is made to expedite an early delivery. We have found it difficult to carry a finished parts stock at all times with the many hundreds of thousands of parts which Westinghouse may be called on to furnish for its apparatus which has been manufactured in the last 40 years, but by having available the activity records (which are being kept every day) better results can be obtained.

The main advantage which is being gained by the promotion of the renewal and maintenance part factory is that the customers are buying renewal and maintenance parts direct from the original equipment manufacturers, and by centralizing all our customers' requirements in one place, quantity production is being realized more each day, and the general cost tendency to everyone concerned is being brought lower.

The original manufacturer of any equipment cares more than anyone else about its operation and the satisfaction it is giving the customer. Therefore, he is very ambitious to see that the customer has the best renewal and maintenance parts and the best service possible at all times. Parts are made from the same specification, drawings, best materials and backed by scientific engineering, the same as the original apparatus purchased many years ago by the customer.

The automotive industry has placed the matter of service and genuine renewal and maintenance parts on a sound basis throughout the world. All the people who own and operate cars for their own personal use, insist that the car be maintained and have genuine parts for the particular make of car purchased from the nearest authorized service department.

It must be remembered that when you require renewal and maintenance parts for any equipment, you cannot buy good, and at the same time buy cheap, genuine renewal and maintenance parts. It is a fact that any part for a repair or renewal will work, but how long and how well is another matter. In the majority of cases the cost of the part is only a small item of the total cost of installation. Your decision as to what kind of service and parts are installed on any kind of equipment can be based on the importance of the work it is to do, how long and how well it will do the work before another replacement is necessary. The law of average has proved it is always best to use high-grade, genuine renewal parts made by the original specifications, serviced by the original equipment manufacturer, backed by scientific engineering and also—the most important factor—backed by the one who cares how your equipment operates and the service you obtain from it.

I believe it was the laxness of the equipment manufacturer in realizing the equipment users' problems. Therefore, the different properties using equipment analyzed their situation in different ways and by different people. The various executives saw things differently; the maintenance supervi-

**Abstract of a paper presented at a meeting of the New York Electric Railway Association, Coney Island, N. Y., June 14-15.*

Digitized by Google

sors saw things differently and this reflected down the line through the master mechanic who has different ideas and ways of doing things in the many shops all over the country.

The usual way to make a repair is with the equipment and material available or most easily and quickly obtained, although it is not the most economical. The traction properties main business is selling rides and a car or a bus tied up in a shop for repairs cannot carry passengers. Therefore, in order to keep and put cars on the tracks the different companies resorted to nearly every measure and the World War is largely responsible for the neglect which was shown by the equipment builders in not paying enough attention to their customers' maintenance and renewal part requirements and the equipment users were forced to do something themselves. Some companies have made a very good job of this entire situation while others have only added difficulties to their many problems.

Every traction property should have a modern and well laid out maintenance shop where the proper repairs could be made in the most economical way. All renewal parts should be furnished by the original equipment supplier who must furnish standard maintenance data information and engineering service to its customers and in this way the standard will be nationally established. This is an absolute necessity to meet our national economic situation.

The railway properties should not manufacture parts but should have a standard set-up for maintenance machining of worn surfaces so that the standard renewal parts can be quickly put in place and cars put back on the street in a minimum time. Spare standard parts are recommended as a solution.

A standard part is one which can be used on a certain type of motor in Boston, New York, Chicago, Cincinnati or San Francisco and can be produced in a central shop in large quantities and sold at a minimum price to the users. However, if we are going to make such apparatus in more places in small quantities, we must pay more and every time a new place is established for making the same things, somebody pays for a set of patterns, dies, drill jigs, fixtures, machine tools, buildings, engineering drawings and specifications, coil formers, moulds, etc. Surely the time must come when we must consider this situation broadly from a national viewpoint.

The larger manufacturers have all the facilities for handling and manufacturing, not only for complete apparatus but for maintenance parts. They have specialized in the study of the time required to perform every operation in all its branches. We feel quite sure that if all the facilities which the larger manufacturers have to offer are taken advantage of a more economic national condition can be realized.

American Association News

Brady Awards Offered Again

NICHOLAS F. BRADY has again authorized the award of the Anthony N. Brady Memorial Medals for best accomplishment in accident prevention and health promotion by electric railway organizations in the United States. These awards will be for the year ended Dec. 31, 1927, and, as in the past, will be made under the joint auspices of the American Electric Railway Association and the American Museum of Safety. The gentlemen who were members of the committee on the award and the committee on the conditions of the competition have kindly consented to serve again. They are:

Committee on the Award — Lewis Gawtry, chairman, president the Bank for Savings; Col. A. B. Barber, manager transportation and communication department U. S. Chamber of Commerce; James H. McGraw, president McGraw-Hill Company, Inc., Lucius S. Storrs, managing director American Electric Railway Association.

Committee on the Conditions of the Competition—Thomas Fitzgerald, chairman, vice-president Pittsburgh Railways; H. K. Bennett, safety manager United Electric Railways, Providence, R. I.; C. H. Evenson, superintendent of transportation Chicago Surface Lines.

As was done last year, three medals are to be given, one of gold, one of silver, and one of bronze, all as first prizes in the folowing classes, respectively: (a) Electric railway organizations operating more than 5,000,000 vehicle-miles; (b) those operating more than 1,000,000, but not over 5,000,000 vehicle-miles; (c) those operating less than 1,000,000 vehicle-miles.

The committee of award may also, in its discretion, make honorable mention of one or more electric railway organizations, based on the same criteria as the award of the medals, or any other factors that may appeal to the committee as especially worthy of commendation.

Attention is called to the fact that the conditions, through their general terms and comprehensive requirements, make it possible for all electric railway companies, no matter how small, or of what nature, or having whatever conditions of operation, to present their own cases in the way permitting the best consideration of their records and the conditions under which their accomplishments have been made.

The conditions, as announced by Arthur Williams, president of the American Museum of Safety, are as follows:

Every competing company shall include data covering all electric railway and bus operations comprising the entire system of which it is a part, without regard to technical ownership. The test ordinarily would be operation under the jurisdiction of a single president.

The attention of companies is particularly called to the fact that their presentations should cover broadly, and as completely as possible, all of the factors prescribed by the committee as conditions for obtaining the award. Weight will be given by the committee to these factors in each company's presentation, based upon their relative accomplishments under each heading. The factors are:

1. The success in gaining good will as indicated by the initiative, skill and enterprise manifested in improved safety conditions.
2. The improved safety conditions which have resulted from original ideas, as well as the extent to which the company has taken advantage of new development of safety in operating and maintenance practice and equipment originating with others.
3. Improvements in safety practice which have resulted in reduced maintenance, or greater reliability of service.
4. Particular success in conducting a safety program and actually reducing the number, seriousness and cost of accidents reported on the association's form. It is understood that all accidents (including miscellaneous) should be included whether chargeable or non-chargeable.
5. Outstanding accomplishments in development of co-operation between management and employees in safety promotion.
6. Outstanding accomplishment in measures to promote sanitation and health.

Additional conditions of the contest are as follows:

7. All presentations must be in the hands of the American Museum of Safety on or before Oct. 1, 1928.
8. Submission of a presentation gives to the committee permission to publish it in whole or in part over the name of the company after the award has been decided on. (If desired, a company may mark certain parts as confidential and these will not be published, although they must be available for reference at Association headquarters to members.)
9. Presentations must cover, as far as possible, accomplishments occurring in the year ending Dec. 31, 1927. (Accomplishments, however, extending over a period of years and reaching their fruition before Dec. 31, 1927, will be considered by the committee.)
10. Presentations should be written on standard typewritten sheets and accompanied by such supporting figures and drawings as may be required. (Permission is granted to print presentations, although the committee prefer that this be not done.)
11. Statistics on a car-mile or other unit basis for the year 1927 in comparison with the previous three years are desirable as evidence of actual accomplishments. These should be reported on the association's forms 342 and 343, copies of which will be furnished upon request.
12. The committee on award may also take into consideration other factors or conditions, if any, which in its judgment have a bearing on the relative accomplishment of any electric railway or railways in the field of safety.

News of the Industry

Three Measures Suggested for Boston Elevated Situation

The special committee of the Massachusetts Legislature, appointed in response to a special message from Governor Fuller to draft new legislation for the Boston Elevated Railway in a final attempt to settle that situation this year, has unanimously reported three measures in the Senate.

The first is a bill calling for the extension of public control of the Elevated for a period of twelve years and a dividend rate of 5 per cent on the common stock; the second is a resolve asking the Governor to appoint a special commission to study the question of further rapid transit line extensions in Boston, and the improvement of existing lines; the third is a resolve authorizing the Boston Transit Department to construct an extension of the Boylston Street subway under Governor Square, which appears to be the most sensitive spot on the Elevated lines today.

It is provided in this third measure that the work in Governor Square shall be paid for by bonds issued by the city of Boston, but before the work is started the Boston Elevated would be required to lease the extension at a rental of one-half of 1 per cent of the net cost plus the interest on the bonds.

These measures will be discussed first by the Senate and then by the House.

Ten Cents Sought in Decatur

The Illinois Power & Light Corporation has filed with the Illinois Commerce Commission schedules which, if approved, will establish a 10-cent cash fare basis for buses and street cars in Decatur, Ill. Three tickets will be sold for a quarter.

Transportation revenues of the Illinois Power & Light Corporation in Decatur have declined materially this last year. The rate is the first increase sought in Decatur since 1921, when the 5-cent tariff was raised to 6 cents. Similar schedules are to be filed for the Quincy, Burlington, Jacksonville and Champaign lines.

New Agreement in Connecticut

The second vote by trolley workers showed definitely that the Connecticut Company would not be hampered in its operations by a strike. Several weeks ago the workers voted to authorize union leaders to declare a strike, but apparently did not understand the real significance of the power they were delegating to others.

Under the agreement now arranged the workers will receive the same wages and serve under practically the same working conditions as in force previously. The agreement does, however, embody minor changes. A bus driver under the new status can switch to trolley service or vice-versa. The Connecticut Company does not recognize the trolleymen's union, but agrees to recognize committees representing the trolleymen. The new agreement will terminate on June 1, 1929. It has been the subject of long negotiations, reviewed step by step in the JOURNAL.

10 Cents Cash in Sandusky

The City Commission of Sandusky, Ohio, on June 25 accepted an ordinance under the terms of which the Lake Shore Electric Railway will be allowed to charge a 10-cent cash fare with seven tickets for 50 cents. The present fare is 5 cents cash with six tickets for a quarter. The company will not be allowed to abandon lines without the city's consent and may be required to substitute buses should a railway line be abandoned.

Subway Problem in Philadelphia

Mayor wants terms fixed for operation of Broad Street subway, soon to be placed in service. Asks commission's aid. City to prepare to run road

AT MAYOR MACKEY'S request, the City Council of Philadelphia, Pa., has unanimously passed a resolution calling on the Philadelphia Rapid Transit Company to join with the city in a petition asking the Public Service Commission to formulate an equitable agreement for operation of the Broad Street subway for two years.

In a message to the Council Mr. Mackey said he would propose to the commission that the P.R.T. pay the carrying charges of $4,900,000 a year which the city has been paying on the $87,656,000 line in return for the operating privilege during the two-year period, and that the company provide that rental amount in advance the first year as an earnest of good faith.

The customary procedure has been reversed in having the commission define the terms of a city-company contract preliminary to its official review of the agreement which the Council will ultimately pass.

It is expected that the Broad Street subway will be ready for operation over two tracks from its northern terminus at Olney Avenue to the Race Street station, with a single-track extension into its temporary terminus under City Hall, by Sept. 1, 1928. The extension to South Street should be ready for operation some time within the next twelve months or shortly thereafter. The Mayor said:

This administration found the Broad Street subway on its doorstep when it took office on Jan. 2, 1928. It was projected and financed long before I became Mayor, and it was obviously my duty to hasten construction to the point where the subway could be put into practical use as quickly as possible.

The portion of the subway from City Hall to Olney Avenue has cost the city $87,656,000. The magnitude of this undertaking is apparent when it is realized that this is close to one-third the value of the entire transit system now serving the city.

The Broad Street subway, with carrying charges of $4,900,000 a year, will have total gross earnings, under the most optimistic estimate, of only $4,000,000. The Philadelphia Rapid Transit Company system, with carrying charges of $14,000,000, has an annual gross of $58,000,000.

The total cost of the subway, Olney Avenue to South Street, will exceed $100,000,000, with total carrying charges of about $6,000,000 a year. Thus a transportation line of 6 miles in length requires carrying charges close to one-half those of a system with total mileage of 1,000 miles. To merge these two systems economically is no easy task.

The estimates of the City Transit Department, based on a traffic survey conducted during March and April of this year, indicate that approximately 75,000,000 passengers a year will be diverted from the Philadelphia Rapid Transit Company surface lines paralleling the Broad Street subway, if these lines are so routed as to bring the maximum number of passengers into the subway, with free transfers as now.

It would be unjust and futile to ignore the effect which this diversion will have on the Philadelphia Rapid Transit Company's earnings, and this has been the principal factor in convincing me of the necessity of looking at this problem from the standpoint of the final result to the city-wide system.

Whatever the terms of the contract upon which the city and the Philadelphia Rapid Transit Company might agree, it must have the approval of the Public Service Commission before it becomes effective. This contract is definitely affected by special considerations which are particularly and exclusively the function of the commission to decide.

The rerouting of Philadelphia Rapid Transit Company lines so as to serve the subway adequately, the fare and transfer arrangements, and the effect of both on the return possible to the city for the support of the city-built system, are all mat-

Digitized by Google

ters upon which the commission will have the ultimate and deciding voice, and because of this the city cannot bind the Philadelphia Rapid Transit Company by making them a matter of contract.

Attention is then called by the Mayor to the fact that the Public Service Commission last year disapproved a contract between the city and the Philadelphia Rapid Transit Company, providing for the lease and operation of the Frankford Elevated Railway and Bustleton Surface Line, entered into only after months of negotiations and numerous public hearings. To avoid a repetition of this experience, the Mayor has asked the Council to request the Public Service Commission to proceed under the public service company law, to signify in advance the form and character of contract that it would approve for operation by the Philadelphia Rapid Transit Company of the Broad Street subway. He also asks that the commission be requested to investigate the expected revenues and the necessary adjustment of lines by rerouting so as to make possible the maximum use of the subway with the greatest possible return to the city.

The Mayor contends that the operating company should be required, as a consideration for a city lease, to assume the full carrying charges of the loan for a period of two years, and as an evidence of good faith and earnestness of the undertaking, to pay to the city the first year's carrying charges in advance, and then to conform, in addition to these terms, if approved by the Public Service Commission, with all the other terms and particulars as suggested by that body, the adoption of which will move the commission to approve the whole lease.

Meanwhile, Mayor Mackey has declined to disclose the details of the operating lease submitted by the P.R.T. for the approval of the city administration.

As if to anticipate possible rejection of the lease the Mayor has since forwarded an ordinance to the City Council which provides for establishment of a bureau of operation in the Department of City Transit so the city can operate the Broad Street subway in September in the event the administration and the Philadelphia Rapid Transit Company fail to agree on terms for an operating lease. The measure has been referred to the transportation committee.

Ten Cents in Savannah

Permission has been granted the Savannah Electric & Power Company by the Georgia Public Service Commission to increase its rates in Savannah, Ga., to 10 cents for a cash fare instead of 7 cents, as at present. Customers may purchase three tickets for 25 cents, or twelve tickets for a dollar. School children will pay a 5-cent fare during the nine months' school term, and children between the ages of five and twelve may use tickets sold at the rate of 24 for $1. Higher rates were sought because of losses sustained by the railway department of the company.

Mr. Sheridan's Resignation Refused

The Missouri Committee on Public Utilities Information has refused to accept the resignation of J. B. Sheridan, secretary of the committee since its inception seven years ago. Members of the committee stated it had no desire to dispense with Mr. Sheridan's services. A statement made public about the matter follows in part:

The purpose of the committee is to disseminate fair and authentic information about public utilities and public utility service, and its members have not changed their belief in the propriety and importance of this work to the users of public utility service, to the utility companies and to the public at large.

Hearing Set for Fare Plea of Queens Lines

The New York State Transit Commission on June 27 laid over for one week consideration of the application of General Lincoln C. Andrews, receiver of the New York & Queens County Railway, for permission to continue a 6-cent fare on the lines of the company. The present permit was due to expire on June 30, but the company is legally entitled to continue charging the extra cent, in view of the fact that an application for an extension of the permission had been made to the commission by the railway company in question before the expiration date.

The commission also set July 10 as the date for a public hearing on the application of the railway to abandon portions of its franchises in Queens. The petition sets forth that no portion of the particular line has been operated since Dec. 4, 1926, due to lack of patronage.

They Find It Out in Poughkeepsie

POUGHKEEPSIE has a population of between 35,000 and 40,000, yet in 1927 more than 3,000,000 fares were paid to the Poughkeepsie & Wappingers Falls Electric Railway, Poughkeepsie, N. Y. The public has discovered that it can ride to and from the business district of the town about as cheaply as it can drive to work in its own cars. For that reason there has been no great decrease in the amount of business done by the railway.

If you leave your car at home, you do not have to worry about parking regulations. There is no confusion, and you arrive safely at your destination. For women and children, the trolleys are safe. That is one important consideration in sending your children to school.

The trolleys pass near the theater district no matter what line you ride. You can reach the shopping district from almost any part of the city in a few minutes by trolley. The electric railway still appears to be a necessity.

—*Poughkeepsie Eagle-News.*

Suit to Determine San Francisco Franchise Expirations

City Attorney J. J. O'Toole, acting for the City and County of San Francisco, has filed a suit in equity in the Superior Court asking for declaratory relief in determining the dates when the disputed franchises of the Market Street Railway expire. This is regarded as the initial step to obtain court decision on the true date of the expiration of the key franchises.

In the complaint, the city states that on Sept. 15, 1879, certain franchises were granted by the city and approved by Mayor A. J. Bryant. Later, on May 29, 1882, amendments to the ordinances of 1879 were adopted by the Supervisors and approved by Mayor M. C. Blake. The complaint states that "an actual controversy has arisen and now exists between the plaintiff and defendant over which is the true expiration date."

The company contends that 1932 is the true expiration date of the following franchises:

Market Street, Ferry to Seventh.
Fifth Street, Market to Bluxome.
McAllister Street, Market to Divisadero.
Hayes Street.
Haight Street, Market to Golden Gate Park.
Valencia, Market to Mission.

Under the terms of a resolution adopted by the Board of Supervisors the City Attorney is directed to start negotiations with the company looking to a transfer of properties and equipment on the lines over which there is no dispute.

Southern Pacific Not the Buyer of Electric Power

J. H. Dyer, general manager of the Southern Pacific Company, San Francisco, Cal., denied reports that the road is negotiating with the American River Water Company for a supply of power to electrify lines over the Sierras. The company had no intention of installing electricity for motive power on its overland route in the immediate future and no negotiations were under way with any company for a power supply, according to Mr. Dyer.

The Southern Pacific Company was mentioned as a possible buyer of electric power to be generated by the American Power Company.

Bill Against One-Man Cars Lost

The committee on labor and capital of the Louisiana House by a vote of six to three has ordered an unfavorable report on the bill to prohibit street railways which operate in the state of Louisiana from running cars with one man.

Railway Seeks to Prevent New Rates in Los Angeles

The Los Angeles Railway, Los Angeles, Cal., has filed a petition in the United States Court asking an injunction to prevent the Railroad Commission and all other persons, including City Councils, from enforcing a recent Railroad Commission order denying the company's application for a fare increase. The corporation also seeks to prevent the Railroad Commission from interfering with the charge and collection upon its system of 7 cents for each fare, or four tokens for 25 cents.

The commission has informed the Los Angeles Council that it had instructed its attorney, Carl I. Wheat, to appear and oppose the granting of these injunctions and asked the city to co-operate in resisting the move of the railroad. The hearing has been set for July 12, in Los Angeles.

Opinions on Seattle's Taxicab Venture Awaited

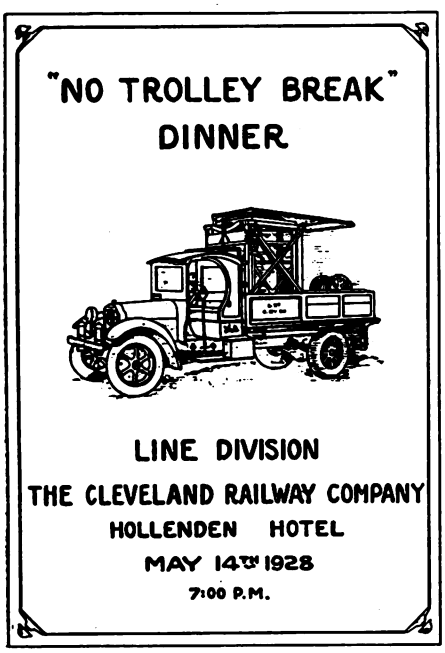
The City Council of Seattle, Wash., with three taxicab proposals before it, has asked T. J. L. Kennedy, corporation counsel, for an opinion on the legality of a proposition submitted by Sam Taggart, to take over the entire taxicab business of the city. Until it receives that opinion, and probably an opinion from the department of business administration of the University of Washington, the Council has decided to shelve all taxicab legislation. Mr. Taggart's proposal is to buy up all existing taxicab companies in the city, deed their equipment to the city, and take an exclusive operating franchise for 40 years, paying the city 2 per cent of the gross receipts, amounting at the start to approximately $50,000. The agreement would provide that at any time the city wanted to take over the operation, or any time any other company offered a better proposition, the city would be at liberty to accept it. This proposition is financed by Seattle capitalists.

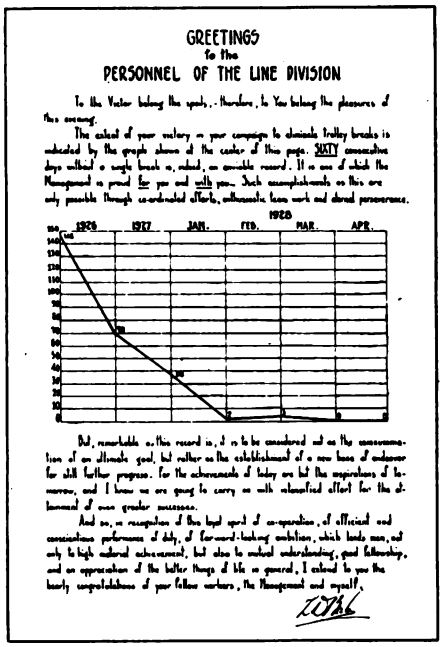
One in Sixty Cleveland Overhead Record

Fifty-five linemen with their immediate superiors and officials of the Cleveland Railway, Cleveland, Ohio, bringing the total up to 70 persons, were tendered a dinner on May 14 as a mark of appreciation of their having completed a period of 60 days on May 3 without a break of the overhead line distribution system. On May 3 this long period of exceptional service by the department under the direction of James Scott, as superintendent, was interrupted by the breaking of a sectional insulator. It was the sixth break of the year. More than sixty days in a city the size of Cleveland is of course a record not easy to duplicate. But the system there has been going ahead steadily in this respect as the fanciful program for the dinner made plain, showing as it did by chart what has been achieved. Moreover, the bill of material, or the menu, was prepared with an especial appeal to the line boys. Incidentally this program was the product of the power department, of which Lawrence D. Bale is superintendent, the line division being a subsidiary of the power department. The bill of material, which, of course, contained its own hint as to what the items on the menu were all about, was as follows:

Bill of Material

Hangers — Ears
Pole Paint
1,000,000 C.M. Cable
Crosbys — Chucks
Scraps
Make-Ups
Soldering Acid
Fuses





Menu card at Cleveland dinner was unusual in its display

New Accident Prevention Plan in East St. Louis

Each motorman, conductor and bus operator of the East St. Louis Railway, East St. Louis, Ill., and its subsidiaries who goes through a twelve-month period without a single chargeable accident will receive a bonus of $36. This is the gist of the accident prevention bonus plan announced by the affiliated railways effective on April 1. Each employee eligible to participate in the bonus plan receives a credit of 36 points. For each chargeable accident a certain number of points is deducted. A safety department board composed of members from various departments will investigate all accidents.

$14,000 Spent by Louisville Railway in Jitney Case

The Louisville Railway, Louisville, Ky., recently entered into an agreement to pay members of the Independent Jitney Bus Operators' Association approximately $200 each, under contract, whereby the established buses would be taken off the streets, blocking any legal battle regarding the new law taking away property without compensation. Sixty-six members of the association received $212.12 each, and settlements were made with about fourteen others not in the association. It was announced that no settlements would be made with any operators who had organized after the law was enacted and while the matter was in controversy.

All jitneys were ordered off the streets at midnight, June 30, at which time the law under which no bus can operate without a city franchise became effective.

Food Industries, a New McGraw-Hill Paper

The McGraw-Hill Publishing Company will publish, starting with the October issue, a new monthly, *Food Industries*, for the men interested in the manufacturing and processing of foods.

Food Industries will cover the technology of manufacturing food products, methods of food production, materials used in food processing and packing, materials of construction for equipment, handling of raw materials and finished products, research on food preservation and preparation, bacteriology, sanitation, improvement of processes and reduction of costs. In general, the paper will be devoted editorially to plant operation and production methods in the food industries.

Editorial direction of *Food Industries* will be under Dr. H. C. Parmelee, editor of *Chemical and Metallurgical Engineering* and vice-chairman of the editorial board of the McGraw-Hill publications, who will continue in those executive positions with McGraw-Hill. He will have as his editorial associates men selected from the food industries. Their names will be announced later.

New York City Protests Surface Fare Increase

New York City on July 3 filed with the Transit Commission a formal protest against granting a 7-cent fare to the Drydock, East Broadway & Battery Railroad, a subsidiary of the Third Avenue Railway, which last month filed schedules calling for the increased rate. The city also objects to the granting of the petition to allow a 2-cent transfer charge between the Drydock line and the Third Avenue Railway system.

The protest was referred by the commission to Clarence M. Lewis, its counsel, to whom the company's petition has already been sent for legal opinion.

Increase Denied Chicago Elevated Railways

A denial of the Chicago Rapid Transit Company's application for 20 per cent increase in rates was issued by the Illinois Commerce Commission on June 28. The company had asked permission to discontinue the sale of three tickets for 25 cents and of $1.25 weekly passes and to substitute a straight 10-cent fare.

The commission based its rejection on the fact that the company had increased its business materially with the present rate structure and on the theory that a decrease in riders and income would follow an increase in fare. Although admitting that the company was not receiving the full return on its valuation as fixed by the courts, the commission declared that "it is equally true that the year prior to the installation of the present rates the predecessor companies lost more than 10,000,000 revenue passengers with a rate schedule in effect similar to the rates now proposed."

Need Seen for Higher Fares in Twin Cities

The St. Paul City Railway has dropped the idea of getting a higher rate of fare in St. Paul, Minn., than in Minneapolis, but the management may be forced to apply to the Railroad and Warehouse Commission for a higher rate in both cities than the present 8-cent cash fare and six tokens for 40 cents; which vice-president T. J. McGill of the Twin City Rapid Transit Company says will be necessary "in fairness to our stockholders, unless there is a turn for the better." Mr. McGill said:

Officials of the company have decided that the only practical plan is to keep the fares of the Twin Cities uniform. A higher fare in St. Paul than in Minneapolis would result in irreparable injury to St. Paul and it would necessarily hurt us. There will be no further effort to increase fares in St. Paul until we take the same action in regard to Minneapolis.

An action of this kind in regard to St. Paul has been taken already and is pending before the commission.

Revenue in both cities is below the return of 7½ per cent set by the commission as a proper amount.

Mr. McGill cited that railway fares in the two cities are 1 cent under the average for large cities, 200 of which now have 10-cent fares. The St. Paul City Railway and the Minneapolis Street Railway are controlled by the Twin City Rapid Transit Company.

Protest in St. Louis

United Railways accepts new fares with reservations on valuation, depreciation and rate of return

THE straight 8-cent fare for adult passengers which became effective on July 1 has been accepted by the St. Louis Public Service Company, but the railway has expressed dissatisfaction with the Public Service Commission's order granting the company a rate-base valuation of $63,500,000 and limiting the annual depreciation allowance to $800,000.

On June 28 the company presented two communications to the state commission at Jefferson City. One, filed by vice-president and General Manager Samuel W. Greenland accepted the 8-cent fare but insisted that the railway is worth at least $75,000,000 for rate-making purposes and also contended that the company is entitled to earn at least 8 per cent on such valuation instead of the 7.14 per cent rate stipulated by the commission.

The other communication was a formal motion for rehearing prepared by Louis H. Landus, general counsel for the company. It asked for the rehearing chiefly on the grounds that the $63,500,000 placed by the commission on the operating properties is inadequate to produce sufficient revenue to give a fair and proper return on the money invested in the properties. Mr. Landus characterized the finding as unlawful, unjust, unreasonable, against the law, against the evidence in that the fair value of the property is in excess of $75,000,000 and that the finding is confiscatory and deprives the St. Louis Public Service Company of its property without due process of law.

It is also alleged that the commission was in error in allowing a return of only 7.14 per cent. Another point raised is that the allowance of only 5 per cent for construction overhead is entirely too low. A further error claimed is the $4,700,000 valuation placed on the real estate holdings of the company—a figure which should be not less than $5,702,218. Further, it is pointed out the commission was in error in placing the cost of financing the company at less than $4,180,000, while the working capital allowance of $600,000, exclusive of materials and supplies, should have been not less than $986,808. The railway contends that the "going concern value" is $8,700,000 instead of the $3,000,000 allowed by the commission.

Another error, it is contended, is the commission's attitude that stress should not be put on either the original or reproduction cost of the properties in fixing the rate-base valuation. The company said reproduction cost is the proper basis for valuations.

Would Dismiss Piedmont & Northern Suit

The answer of the United States of America to the suit of the Piedmont & Northern Railway, involving the extension of the road's electric lines in the Carolinas, has just been filed at the office of the clerk of the United States Court for the Western District of South Carolina, at Greenville, S. C. The document asks that the suit of the Piedmont & Northern be dismissed, mainly on the grounds that the United States District Court lacks jurisdiction to hear the case.

The electric railway company entered suit against the government and the Interstate Commerce Commission in an effort to set aside and annul a ruling of the commission in which a petition of the railway to extend its lines was denied. In seeking to have the ruling annulled, the main contention of the road was that the Interstate Commerce Commission lacked authority to govern the road's actions and plans. The main allegation of the Piedmont & Northern is denied in the answer of the government in which dismissal of the action is prayed, the jurisdiction of the district court to hear the case being strongly contested.

Shortly after the Piedmont & Northern filed its suit against the government in Federal Court at Greenville, seven steam railroads sought to be made "parties defendant" with the government to the suit. The steam roads pointed out that they operated lines in North and South Carolina and charged that they were "directly and indirectly" affected by the proposal of the electric railway to extend its lines from Spartanburg, S. C., to Gastonia, N. C., and from Charlotte to Winston-Salem, N. C.

Hearing on preliminary questions in the suit of the electric railway, among them the intervention petition of the steam railroads, was set for June 28 before Judge Morris Sopher of Baltimore, at Asheville, N. C.

Situation in Hamilton Reviewed

At the hearing before the Ontario Railway and Municipal Board on June 12 the Hamilton Street Railway, Hamilton, Ont., produced much evidence to show that the system had been unprofitable for several years. The company is petitioning for a 10-cent fare on the cars and a 15-cent rate on the buses. After the hearing on the fare question is concluded the application of the men will be heard. They are seeking an increased wage of from 47 cents to 60 cents an hour.

A considerable part of the session on June 12 was consumed by the oral report of W. J. Hagenah, an American expert, who made an appraisal of the company's system in April. Glyn Osler, a railway representative at the hearing, said that the company found it impossible to continue to give service at a 5-cent fare, a rate most companies had discarded, meet expenses and provide a return of any consequence on the investment.

$50,000 Authorized for St. Louis Survey

Mayor Victor J. Miller of St. Louis, Mo., on June 26 signed the bill authorizing the expenditure of $50,000 for a transit survey by a special commission. This measure was sponsored by Mayor Miller.

The commission will include the Mayor, city comptroller, presidents of the Board of Aldermen and Board of Public Service, the director of streets and sewers, one other Alderman, a member of the Missouri Public Service Commission and representatives of the City Plan Commission and the St. Louis Public Service Company and seven private citizens.

An outside engineer will probably be retained by the new commission to advise it on technical matters. Mayor Miller has asked C. E. Smith, vice-president of the New York, New Haven & Hartford Railroad and former consulting engineer for the city, to recommend an engineer for the place. The commission will begin functioning on July 26. Its personnel has not been selected.

Higher Wages Sought by Border Men

Platform men of the Hydro-Electric Railways, Windsor, Canada, have presented demands for a wage increase of 10 cents an hour to William R. Robertson, general superintendent. In addition to seeking a higher wage, the men are asking for operation of two-men cars on the two trunk lines and a week's vacation with salary.

Mr. Robertson told the committee which interviewed him that operation of two-men cars as requested would require the services of fourteen additional men with an increase of $28,000 in the annual payroll. He said that the aplication would be referred to the Hydro-Electric Commission at Toronto.

Same Privilege for Summer Students in Atlanta

An order has just been issued by the Georgia Public Service Commission directing the Georgia Power Company to sell street car tickets to children attending summer school on the same basis as those attending school during the regular nine months' term. Accordingly, children who present the proper certificates showing that they are bona-fide summer school students may secure tickets at the rate of 20 for $1.

No Change in Toledo Wage Issue

No agreement on a new wage contract between the street car men's union and the Community Traction Company, Toledo, Ohio, has been reached, despite the fact that the 1927 agreement expired on June 1. So far no concessions have been suggested by the company other than the extension of the last year's plan with a few minor changes. The men have not pressed their demand for an increase, but have been insistent on resumption of the two weeks' vacation with pay which was formerly a part of the contract.

Sept. 10 Fixed as Date for Washington Fare Hearings

As a result of the discussion of the petition for a fare increase presented by the Capital Traction Company, Washington, D. C., the Public Service Commission has arrived at two decisions. It has been decided definitely to omit the Washington Railway & Electric Company from consideration so far as permitting it to benefit from any increase granted the Capital Traction Company, and Sept. 10 has been tentatively set as the date for beginning the proposed hearings.

Reduced Fares on Northeast Oklahoma Line

A reduction of passenger fares, effective July 1, was announced on the lines of the Northeast Oklahoma Railroad through H. B. Cobban, general manager. A uniform fare of 10 cents between all points on the lines was made effective. The reduction does not apply to the buses. The Northeast Oklahoma Railroad operates electric interurban and bus lines in the lead and zinc mining districts of northeastern Oklahoma and southwestern Kansas. The company gave everyone an opportunity to ride free, one or more times, on its lines on June 30 and thousands availed themselves of the privilege.

Soft Seats Seduce Shekels

Cushions Commended to Car Companies as Cash Collectors; P. E. Plans Putting Profits into Pads for Patrons

SOFT seats not only turn away the wrath of street-car riders, but tend to convert more pedestrians into riders. Inasmuch as increased patronage makes for more revenue, the admission was made today as an item of information to members of the California Electric Railway Association in convention at the Cliff Hotel, San Francisco. Its purveyor was A. W. Brohman, transportation superintendent for the Market Street Railway of San Francisco.

He said that the company suffered a decrease in total revenue last month, but that on lines where cushion seats are in use, the earnings mounted. He followed his statement with the prediction that within a few years all California electric lines will come to the soft-seat era.—From account of meeting of California Street Railway Association in Los Angeles *Times*.

Columbia Property Not to Be Sold

The transportation situation in Columbia, S. C., has recently taken a new turn. Circuit Judge W. H. Townsend of Columbia has issued a permanent injunction enjoining the sheriff of the county in which Columbia is located from selling the property of the Columbia Railway, Gas & Electric Company under an execution to satisfy a judgment for $20,000. Records show that in 1924, C. H. Leitner instituted a suit against that company to recover damages suffered by him due to alleged negligence on the part of the railway. He was awarded a verdict of $20,000, which, on appeal, was upheld by the State Supreme Court. This judgment, it is claimed, has never been paid and an execution was issued thereon to the sheriff and the railway company furnished the sheriff with a list of property to be regarded as levied upon, which was especially street cars and street car tracks, and the sheriff advertised this property for sale in July, 1928.

The complaint on which the injunction order was issued sets forth that the "purpose and intent of the Broad River Company is to effect a complete transfer of all the property and franchises now claimed by the companies to be owned by the street car company and which are necessary for the operation of street railway service so that the liability of both companies to operate such service in Columbia . . . might be rendered nugatory, and to complicate, if possible, the proceedings in mandamus pending in the State Supreme Court, and to render inoperative any judgment which might be rendered therein" to require these companies to operate the street car system.

The story of the acquisition of the Columbia Railway, Gas & Electric Company by the Barstow interests and the subsequent moves relative to the separation of the different branches of the Railway, Gas & Electric Company is told in the complaint and it is alleged that the making of the railway an independent unit was in line with a plan not to render railway service.

This order by Judge Townsend follows close on the handing down of an opinion by the United States Circuit Court of Appeals, in the case of the Columbia Railway, Gas & Electric Company against the state of South Carolina, John M. Daniel, attorney general, and the city of Columbia, in which the company appealed from the ruling of the district court of the United States for the eastern district of South Carolina.

This opinion was to the effect that the electric railway was not entitled to the benefits of the bankruptcy act—that it could not go into bankruptcy.

Recently a referee completed the taking of testimony on the mandamus proceedings instituted to compel the company to restore service in Columbia. The findings of the referee, appointed by the Supreme Court, have not yet been submitted to the court. Railway service was discontinued in Columbia in March, 1927.

Recent Bus Developments

Staten Island Bus Rights Protested

The Richmond Railways, operating six lines on Staten Island, has started court proceedings to annul the certificate of convenience and necessity awarded by the Transit Commission to the Tompkins Bus Corporation permitting it to operate eighteen bus lines on Staten Island. The railway contends that the proceedings were illegal and the certificate was issued on insufficient proof. Supreme Court Justice McGoldrick has ordered the Transit Commission to certify all its proceedings in the Supreme Court.

The petition alleges that the Tompkins Bus Corporation's application for a certificate permitting it to operate its bus lines was granted on May 16 last, and that on June 13 the commission denied an application by the Richmond Railways for a rehearing.

The railway asserts that the Tompkins Bus Corporation, organized in April, 1925, without any authority began operating bus routes in competition with the trolleys, charging at first 5-cent and later 10-cent fare. The company also alleges that the certificate granted to the bus company is void because twelve votes were required from the Board of Estimate in granting the company a charter.

The petition charges further that eleven of the eighteen routes approved for the Tompkins company in many instances are on the same streets as the plaintiff's trolley line, and in other cases parallel the Staten Island Rapid Transit tracks, and that the competition of the bus company will injure the other transportation companies to the extent that the earnings will be insufficient to support their operation "to the consequent injury of the public." The financial incompetency of the bus carrier also is charged.

Fewer Bus Passengers in Kansas City

At the end of the first two weeks under the new trial bus franchise the Kansas City Public Service Company reports that with a 15-cent fare trunk-line buses took in $3,924 less and hauled 70,475 fewer passengers than in the similar period last year. The weather conditions account for some of the decline, but the decline on the trunk lines is said to be greater than the company anticipated.

There was a decrease in patronage and revenue on every line except the Broadway-55th buses, which replaced the 25-cent express line. On this line both the number of passengers hauled and the revenue increased. The total number of passengers hauled during the first two weeks of June this year was 171,193 compared with 241,688 last year. The revenue this year was $19,516 compared with $23,440 last year.

New Service Planned for Lookout Mountain

The Tennessee Electric Power Company has notified the Board of Commissioners of Lookout Mountain that it will replace the present electric railway line on top of the mountain with buses. Two buses will be placed in operation for the initial service. The company contends that it has been losing about $10,000 a year on the mountain line. In addition to following a schedule over the important mountain streets on an hourly basis, several trips a day will be made to the new hotel by the buses.

New Route Mapped Out by Holyoke Company

A franchise has been granted the Holyoke Street Railway to operate a bus line between Mount Tom Junction and Easthampton, Mass. The railway is negotiating for the purchase of a 29-passenger bus which will make hourly trips from each point. This service is planned in place of the regular railway service. It is expected the change will be instituted about July 15.

Issues Ruling on Bus Applications in Iowa

In considering appeals from decisions of the State Railroad Commission affecting application for bus lines, district courts of Iowa have no right to review questions of fact affecting the discretionary powers of the commission, but must base their decision solely upon questions of law involved. The Iowa Supreme Court so ruled recently in reversing the Cerro Gordo County District Court. The case involved the petition of the Waterloo, Cedar Falls & Northern Railway for a permit to operate a bus line paralleling, in part, the route of the Red Ball Transportation Company of Mason City between Waterloo and Mason City. The Supreme Court ordered that a certificate be issued.

Where to Go and How!

The Florida Motor Lines, a Stone & Webster subsidiary, has announced summer excursion trips to Asheville, N. C., with round-trip rates including hotels and expenses of side trips in the mountains. Trips will take ten days. The excursion buses will leave Tampa and Orlando.

New Line Authorized in Lackawanna

John F. Burke, receiver of the Hamburg Railway, has been authorized by the New York Public Service Commission, to operate a bus line from the Hamburg Turnpike to South Park Avenue in Lackawanna, N. Y. This line will form a connecting link with another line now operated by the receiver in that city. The extended route will provide belt-line service in Lackawanna.

Bus Rights Sought in Burlington

Further testimony will be taken on July 24 by the Public Service Commission of Vermont on the application of the Burlington Rapid Transit Company to operate buses over a loop route from the City Hall to Lakeside and return. At present the company is operating buses under a so-called hack license at Ethan Allen Park, the plant of the American Woolen Company, and on the Lime Kiln Road.

William S. Appleyard, president of the company, believes that for the type of service intended to be furnished the buses would be preferable to trolley cars. He announced his willingness to take over the service now being given in this part of the city by the Burlington Traction Company, but to do so by giving service with buses. As an earnest of good faith the people of Burlington were invited by the company to ride free in a new Twin Coach.

The company's plea is being opposed by the Burlington Traction Company, a subsidiary of the People's Light & Power Corporation. As it appears now the situation stands about as follows: The Public Service Commission wants more evidence on the score of the convenience and necessity of the new service; Mayor Girard of Winooski and City Attorney Hopkins of Burlington are against the elimination of the trolleys; the railway says no more money will be spent on improvements until the attitude of the commission is known toward further bus competition, but that the company will put the railway in good order if the bus petition is denied. Edward J. Neary of Griffin, Sherwood & Neary, Inc., New York, consulting engineers, testifies the railway is in poor physical condition.

Buses Replace Cars on Pennsylvania Line

The last trolley was run over the tracks of the Media-Glen Riddle division of the Southern Pennsylvania Traction Company on July 1 and operation of buses from Chester to Media and thence to Glen Riddle began.

Permission to abandon was authorized several days ago by the Public Service Commission. Tracks will soon be removed.

Financial *and* Corporate

New Company for Phillips Holdings

The Rochester Empire Power Corporation has been incorporated in Albany with a capital of 200,000 shares of $100 par preferred stock and 1.600,000 shares of no par common stock as a sequel to the recent purchase of the Mohawk Valley Company and the New York State Railways from the New York Central Railroad by E. L. Phillips and his associates.

The Rochester Gas & Electric Corporation, leading subsidiary of Mohawk Valley Company, together with the New York Central Electric Corporation, the Empire Gas & Electric Company, and the Elmira Water, Light & Railroad Company, subsidiaries of the Empire Power Corporation, which Mr. Phillips has controlled several years, will be consolidated in the Rochester Empire Power Corporation. The Long Island Lighting System, Mr. Phillip's first utility property, and the New York State Railways, will continue to operate independently.

The four properties to be combined in the new corporation have total assets of $105,792.761, and their gross earnings in 1927 aggregated $19,523,052. They furnish electricity in Rochester, Canadaigua, Geneva, Cayuga, Seneca, Elmira. Corning, and numerous other towns and villages, as well as extensive gas services, transportation by trolley and bus and steam-heating plants in the territory served.

Sale Date of St. Paul Southern Fixed

Sale of the St. Paul Southern Railway, an electric line operating between Hastings, Minn., and St. Paul, has been ordered by the District Court of Dakota County on July 16. The order by Judge W. A. Schultz followed petition by Receiver C. B. Kuckler of Hastings. The company owns the right-of-way from Hastings to Inver Grove, a suburb of south St. Paul. Albert T. Clark, Minneapolis, has made an offer for the line, which has been in receivership since 1918.

Missouri Pacific After Port Arthur Line

It is reported that the Missouri Pacific Railroad has decided to exercise an option which it obtained some time ago to purchase the electric railway of the Eastern Texas Electric Company, running over the 25 miles between Port Arthur and Beaumont. The line intersects the Gulf Coast branch of the Missouri Pacific at Beaumont and would afford the latter an opportunity for constructing deep-water terminals at or near Port Arthur. The steam road will operate the new acquisition principally as a freight carrier, since the passenger traffic can be taken care of by a line of buses which the Eastern Texas Electric Company already has in operation between Beaumont and Port Arthur.

Small Increases in Gross in Baltimore Under New Rates

An increase of $27,405 in gross earnings during May, compared with the corresponding month of last year, is reported by the United Railways & Electric Company, Baltimore, Md. This increase reflects the 8⅓-cent fare. It was brought about in spite of a decrease of 1,450,029, or 7.63 per cent, in passengers.

On account of increased operating expenses, including higher wages, the company did not show an improvement in net income. This decline was only 2.82 per cent, however, the figures being ?61.738, compared with $63,529.

Charles D. Emmons, president of the United, says that while the increased fare evidenced itself in the May gross receipts the increased gross earnings since the new rate of fare went into effect have been at a rate $400,000 less than that estimated by the Public Service Commission, as necessary in the public interest.

COMPARISON OF EARNINGS OF UNITED RAILWAY, BALTIMORE, UNDER NEW FARES

	May, 1928	May, 1927
Passenger revenue	$1,412,390	$1,384,527
Other revenue	18,037	18,494

Audit Ordered at Detroit

An audit of the books of the department of street railways at Detroit, Mich., has been ordered by the Street Railway Commission. For several years this firm has audited the books of the system, and in each instance the figures arrived at have differed from those of the department auditor.

Commissioner John Gorman stated that it would be necessary for the commission to set some definite rule relative to depreciation if any benefit was to be derived from the audit by an independent firm. In the past, the Price-Waterhouse figures have not corresponded with those of the system's own auditor largely due to different methods of fixing depreciation.

Short Abandonment in Cortland

The Public Service Commission on July 2 authorized abandonment by the Cortland County Traction Company of about 500 ft. of its system in Cortland, N. Y. Only one car has been operated over the tracks making connection with the Lackawanna Railroad's passenger trains. Another line runs within 500 ft. of the station. The railway applied for leave to abandon at the request of the Cortland authorities.

Memphis Interurban Removed

Removal of the rails is now about complete on the tracks of the Memphis & Lake View Traction Company. This 11-mile line extending from Memphis, Tenn., to Lake View, Miss., was abandoned on May 1. Approximately 1,000 tons of rail will be removed. One hundred tons of this rail have been sold, leaving 900 tons for further sale. All the copper has been sold.

Outstanding bonds totaling about $75,000, half of the company's capitalization, will be taken up in full on Nov. 1. Holders of these bonds who desire to liquidate before that date can redeem them.

The company was founded in 1911 when Lake View appeared to be the coming suburban resort. In 1912 the company was reorganized, a group of bondholders taking over the line. At the request of the reorganized company the Memphis Street Railway then purchased the line, issuing $150,000 of bonds to replace the earlier securities.

Loss on Northern States Railway Lines

Railway gross revenue of the Northern States Power Company and subsidiaries for the year ended Dec. 31, 1927, was $268,370 compared with $268,-705 a year ago. Net earnings of the railway department showed a loss in 1927 of $34,599 compared with a loss in 1926 of $30,654. The company serves Fargo, N. D., and Moorhead, Dilworth, and St. Cloud, Minn., with electric railway transportation.

Traffic Decrease in Oakland

General business conditions affect passenger traffic and earnings on Key System Transit. Passenger revenue totaled $7,306,392. Operating expenses increased $468,559

DURING the year 1927, 788,177 passenger car miles of service was eliminated by the Key System Transit Company, Oakland, Cal., and bus service increased 344,307 bus miles, but the saving in operating expenses, as a result of this net decrease in service, was totally absorbed by an increase in the average hourly rate of wages paid platform men. This was reported in the annual statement of the company for the year ended Dec. 31, 1927.

Revenue passengers on the street car division were fewer by 2,717,121 passengers during 1927 compared with 1926, which, added to the decrease of 547,006 in transfer passengers, made a decrease of 3,264,127 passengers on the Street Car Division. All classes of passengers on the Street Car Division decreased with the exception of the 3½c. school children's fares, which showed an increase of 154,515. The largest decrease in the number of passengers occurred in the 7-cent fares which amounted to 2,730,448. The passengers carried on the Transbay Division increased 328,850 during 1927 compared with 1926. Total revenue passengers on the entire system decreased 2,399,271, which is 2.75 per cent less than the previous year. This decrease was due largely to general business conditions, and increased use of the privately owned automobile.

The passenger revenue for 1927 was $7,306,392, compared with $7,447,397 for 1926. Total operating revenues decreased $144,762, from $7,597,584 for 1926 to $7,452,821 for 1927. Operating expenses increased $468,559, which was due largely to increased maintenance charges and reduced construction work. Sufficient service was eliminated to offset the increase in the average rate of wages paid platform men, and in addition, to show a small reduction in the conducting transportation costs for the year 1927 compared with the previous year. Taxes decreased $42,111, the result of decreased revenue. The increase of depreciation of $42,000 is the result of installing additional property.

Future Outlook Uncertain

The interest on bonds and funded debt for the year was $1,153,992. This is an increase of $176,616 over 1926. In addition to the interest charge of $1,153,992 there was a serial maturity on the equipment note issue of $175,000 and sinking fund installments of $34,935—making the total fixed charges for the year $1,363,927. The operations for the year resulted in a deficit of $579,017.

Twelve bus lines were operating at the end of 1927, and, even though every line showed an operating loss, there have been demands for extensions of bus service. The net loss from bus operation for 1927 was $206,305.

President Lundberg said the earnings for 1927 were totally unsatisfactory, both from the standpoint of the stockholders and bondholders. The bondholders had received their interest up to date, but it had only been made possible by the adoption of drastic measures.

Net additions to the property completed and put into operation involved an expenditure for 1927 of $1,722,320, making a total of new work completed for four years beginning with 1924, $4,289,072. In addition to this amount there was in progress $3,146,822 of work not completed at the end of the year 1927, of which the estimated amount of additions is $2,840,000, making total net additions for the four years $7,129,072.

One street car division passenger car No. 899 was constructed at the company's shops and put in service. Fourteen Fageol 28-passenger buses and one single-deck street car type 40-passenger Fageol Twin Coach were purchased and put into service. Additions were made to other equipment.

INCOME ACCOUNT OF THE KEY SYSTEM TRANSIT COMPANY FOR THE YEAR ENDED DEC. 31, 1927

Gross operating revenue		$7,452,821
Operating expenses:		
Way and structure (maintenance)	$544,061	
Equipment (maintenance)	558,375	
Power (maintenance and operation)	722,113	
Conducting transportation	3,231,505	
Traffic expenses	5,171	
General and miscellaneous	845,971	
Transportation for investment and construction overhead (credit)	54,648	5,852,550
Net operating revenue		$6,400,271
Less taxes		132,335
Operating income		1,167,936
*Add non-operating income		146,453
Gross profit		1,314,389
Sundry Charges:		
Depreciation	733,576	
Amortization of franchises	8,762	
Abandonment of obsolete equipment	11,698	754,036
Balance—current operations		560,352
Deductions:		
Bond interest	1,078,250	
Other interest	46,022	
Miscellaneous	29,719	1,153,992
Deficit—current operations		593,640
Profit and loss adjustments (credit)		14,623
Deficit for year 1927		579,017
Surplus from prior year	277,083	
Less dividend, for last quarter of 1926, on prior preferred stock paid Feb. 15, 1927	103,411	173,672
Final deficit		$405,345

*Includes $116,859 net revenue, Key System Service Company.

MISCELLANEOUS STATISTICS OF THE KEY SYSTEM TRANSIT COMPANY FOR THE YEAR ENDED DEC. 31, 1927

Passengers carried:		
Street car division:		
Cash and ticket fares—7 cents		64,300,070
School tickets—3½ cents		2,322,706
Commuters (East Bay Cities)		712,826
Miscellaneous—14 cents and 21		695,949
Total revenue passengers		68,031,552
Free transfer passengers		19,892,829
Total revenue and transfer passengers		87,924,381
Transbay Division:		
21 cent Transbay fares	7,396,651	
Commuters—Transbay	8,227,823	
10 cent children's fares	157,407	
S. F. Sacto. R. R. Co. tickets	201,517	
Miscellaneous Transbay tickets	61,937	
Total Transbay passengers		16,045,335
7 cent fares (East Bay cities)	471,157	
3½ cent school tickets	48,469	
Total passengers (East Bay cities)		519,626
Total revenue passengers—Transbay Division		16,564,961
Entire System:		
Revenue spassengers		84,596,513
Revenue and free transfer passengers		104,489,342
* * * * *		
Average fare—revenue and transfer passengers—street car division, cents		5.29
Average fare—revenue passengers—Transbay, cents		15.69
Average number of passengers per day—street car division		240,889
Average number of passengers per day—Transbay		43,960
* * * * *		
Car mileage:		
Passenger car mileage	17,276,057	
Freight car mileage	33,531	17,309,588
Car-hours:		
Passenger car-hours	1,644,776	
Freight car-hours	6,828	1,651,604
Ferry boat mileage		109,984
Motor coach mileage		1,305,142
Rolling and Flotating Equipment Owned:		
Passengers cars	517	
Motor coaches	48	
Work cars	102	
Tool cars and wreckers	3	
Electric locomotives	3	
Ferry boats	7	
Miles of track owned		261.76
Miles of track operated under lease		2.22
Total miles of track operated		263.98
Miles of bus lines operated (round trip distance)		62.95

Sale of Detroit United Likely Soon

More than 90 per cent of the outstanding Detroit United Railway first mortgage and collateral trust bonds and Detroit, Monroe & Toledo Short Line Railway first mortgage bonds have now been deposited under the Detroit United Railway reorganization plan.

The reorganization committee has not extended the time for deposit, but both issues are still being received on deposit under the plan by Central Union Trust Company, New York, pending receipt of instruction from the committee to refuse to accept additional deposits. It is expected that the decree of sale will be entered soon.

Abandonment in Buffalo 2 1/3 Miles

The Public Service Commission on July 2 approved a petition of the International Railway in which the railway asked permission to abandon certain parts of its existing system in Buffalo covering 2⅓ miles. Service is not now being given over the tracks. No opposition was voiced at a hearing before Commissioner Pooley.

Interstate Reports 1927 Activities

An achievement of the year 1927 was an arrangement by which interchange of freight traffic with the steam railroads was extended. This fact was mentioned in the report of the Interstate Public Service Company, Indianapolis, Ind., for the year ended Dec. 31, 1927. Through rates and working agreements were made which enabled the electric railway to ship and receive freight to and from 199 additional cities and towns in the Central Freight Association territory.

Six new all-steel passenger cars, equipped for multiple operation, were placed in service connecting New Albany, Jeffersonville and Louisville. These cars are the latest type of development and design, attractive in appearance, and have comfortable riding qualities. Four one-man Birney cars were added and placed in service in New Albany city lines. The parlor-buffet and sleeping car service between Indianapolis and Louisville created additional business.

More than 3,000 feet of track in New Albany were relaid with modern heavy-weight girder rail placed in concrete. An extensive amount of ballast has been used in track construction.

Bus service has been extended so as to cover the entire territory between Indianapolis and Louisville. An additional route was opened between Southport and Indianapolis.

During the year 30 additional electric warning signals were installed at road crossings. Air whistles on interurban cars were replaced with high-pitch electric horns which can be heard at greater distances and give effective warning.

The earnings of the railway lines of the company are not shown separately from those of the rest of the system.

$16,638 Surplus on Baltimore Interurban

For the year ended Dec. 31, 1927, the surplus of the Washington, Baltimore & Annapolis Electric Railroad was $16,638. The report follows:

YEAR ENDED DEC. 31, 1927		
Operating revenue		$2,601,365
Operating expenses including depreciation		1,915,684
Net operating revenue		$685,681
Taxes		131,882
Operating income		$553,799
Non-operating income		19,190
Gross income		$572,989
Deductions from gross income:		
Interest on bonds and notes	$535,804	
Miscellaneous deductions	20,547	
		556,351
Surplus for the year		$16,638
Surplus Account as of Dec. 31, 1927		
Surplus at beginning of the year		$1,331,745
Surplus for the year		16,638
		$1,348,383
Net deductions from surplus		659,107
Surplus at close of the year		$689,275

One and one-half per cent of the gross operating revenue, railway lines, was credited to "Reserve for Injuries and Damages."

Amount credited for twelve months to Dec. 31, 1927	$30,312
Balance in account at Dec. 31, 1926	115,333
Total	$145,646
Expenses and indemnities	36,630
Balance in reserve account Dec. 31, 1927	$109,015

The disbursements in payment of accident claims, suits, judgments and other expenses were 1.81 per cent of the gross operating revenue, railway lines.

MILEAGE TABLE

	On N.B. & A.E.R.R. Tracks	On Tracks Operated under Contract
Miles of single track	73.524	6.667
Miles of second track	40.934	6.667
Miles of sidings and turnouts	19.3598	.....
	133.8178	13.334

Traffic, Fare and Wage Figures

The number of revenue passengers, including bus passengers, reported by 215 companies to the American Electric Railway Association for May, 1928, compared with May, 1927, is as follows:

May, 1928	828,347,231
May, 1927	832,301,137
Decrease, per cent	0.48

The percentage decrease for May is the smallest which has occurred in any month this year. Since January, in fact, the percentage decrease each month under 1927 has steadily declined, indicating very gradual improvement in traffic. The only exception to this was the month of April, which showed a decrease of more than 3 per cent. This was due, however, to the fact that five Sundays were crowded into the month.

Average cash fares in cities of 25,000 population and over were

	Cents
June 1, 1928	8.1341
May 1, 1928	8.1186
June 1, 1927	7.9597

The rise in the average fare was due to increases in San Jose, Cal., and Sioux City, Iowa.

The average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate Cents	Index Number 1913 = 100 Per Cent
June 1, 1928	57.44	210.79
May 1, 1928	57.40	210.64
June 1, 1927	57.13	209.05

Detroit Receipts Decline

The balance in net income from operation of the Detroit Municipal Railway, Detroit, Mich., for the month of May was $34,928 after all interest and sinking fund charges or $31,377.92 below the net earnings for May, 1927.

On June 1 the system paid $500,000 as the semi-annual payment to the Detroit United Railway on the purchase contract. This brings the total amount paid by the city up to $6,000,000.

STATISTICS OF THE WASHINGTON, BALTIMORE & ANNAPOLIS ELECTRIC RAILROAD FOR THE YEAR ENDED DEC. 31, 1927

Car-Miles

Passenger (electric)	4,144,110
Auto motor coaches	6,754
Freight (electric)	263,754
Service (electric)	7,386
Total	4,422,004

Legal Notes

CALIFORNIA—*City May Use Railway Depreciation Fund for Extensions.*

The city of San Francisco is permitted to use part of the so-called "depreciation fund" for its street railway system, to build extensions to that system. [Hunt vs. Boyle, 267 P., 97.]

FEDERAL CIRCUIT COURT—*Testimony of Superintendent That Motorman Denied That Accident Occurred Held Hearsay, and its Admission Prejudicial Error.*

In an action for injuries to a passenger alighting from a street car, the railway superintendent testified that he brought each motorman operating on that route between the hours during which the accident occurred to his office and led each one to believe that he thought he had such an accident; nevertheless each declared positively he had no such accident. This testimony was held to be hearsay, objectionable and prejudicial and sufficiently so that a new trial was granted. [Armborst vs. C. T. Co., 25 F. (2d) 240.]

FEDERAL SUPREME COURT—*Railroad Has Power to Grant Taxi Company Exclusive Privileges at Depot.*

A contract between a railroad and a taxi company allowed the latter exclusive privileges of sending agents on the railroad's trains, into its depots and on surrounding premises to solicit the transportation of passengers and baggage. This permission was held to be valid, in spite of the complaint of a rival taxi company. The case came under the federal courts because the privileges related to railway property in Louisville, Ky., while the taxicab company to which the privileges were granted was organized in Tennessee. [Black & White T Co. vs. Brown & Yellow T Co., 48 S. Ct., 404.]

FEDERAL SUPREME COURT—*Legality of Requirements on Interstate Buses Considered. Known Intent of Passenger Rather than Wording of Ticket Determines the Character of Commerce.*

A municipal ordinance requiring both intrastate and interstate bus operators entering a city to obtain liability insurance from insurance companies authorized to do business within the state and other non-discriminatory regulations for the purpose of insuring the public's safety and convenience are reasonable. The charge of a license or registration fee for all such buses no larger than is reasonably required to defray the expense of administering the regulations and providing a fair contribution to the cost of constructing and maintaining the highways may be made by a city or state. But such fees and contributions cannot be sustained as a police measure, and a flat tax substantial in amount and the same for buses plying the streets continuously in local service and for interstate buses making only a single trip daily cannot be sustained. An occupation tax from one engaged in both intrastate and interstate commerce can be assessed by the state, or may be delegated by the state to be exercised by a municipality, but the fee must be imposed solely on account of the intrastate business done. It must not be increased because of the interstate business, and one engaged exclusively in interstate commerce would not be subject to the tax. A bus carrier which required all passengers to purchase an interstate ticket but habitually made stops to permit any who so desired to ride only between two points in the same state was doing an intrastate business. The destination intended by the passenger when he begins his journey and known to the carrier determines the character of the commerce. [Sprout vs. City of South Bend, Ind. 48-S. Ct., 502.]

MASSACHUSETTS—*Railway Allowing Passengers to Make Part of Their Journey on Foot Must Warn Them of Special Dangers.*

Owing to the construction of a bridge, the cars on a city railway were stopped on one side of the bridge and passengers crossed on foot to continue their transportation on the other side. In such circumstances the railway should stop its cars at a safe place and warn the passengers of the danger of stepping into any holes which may be in their way during their walk. [McManus vs. B. E. R., 160 N.E., 529.]

NEW JERSEY—*Right to Use Highway Does Not Imply Paving Charge.*

By agreement with the governing body of Kearny, a street railway company in 1926 removed its poles and overhead wires from the streets but reserved the right of replacing them and resuming operation of its railway at any time in the future should it so determine. Subsequently, the street was repaved and the company was assessed for the cost of the paving between the tracks and for a distance of 18 in. outside. The remainder of the cost of paving was defrayed by the town at large. The court held that a mere right to use a highway in the future did not subject the company to assessment for paving. [P. S. Ry. vs. Town of Kearney, 140A., 275.]

NEW YORK—*Commission's Control Over Fares Extended to Lines Operated Under City Franchise.*

A railway company operated about 2½ miles of its 39½-mile system within a city on a franchise from the city specifying a rate of fare. On the rest of its system there was no question but that the Public Service Commission had control over fares. The right of the commission to increase fares over all parts of the system was upheld. [Fagal vs. P. S. Commission, et al., 227 N.Y.S., 18].

OHIO—*Convenience of the Public Only Justifiable Reason for Additional Motor Bus Service.*

The Public Utilities Commission granted permission to a motor bus company to change the leaving time of its buses from their terminals and to increase its service. The change was made over the protest of a competing carrier. Evidence indicated that the purpose of the change was entirely for the convenience of the company and that no public convenience required the change. The action of the commission was reversed by the Supreme Court. [Lake Shore E. R. Co., vs. P. U. Comm., 160 N.E., 685.]

OHIO—*While on a City Street the Motorman Must Keep a Constant Lookout for Persons on the Track.*

A boy was hit by an automobile on a city street, and while in an unconscious condition was thrown on the track in front of an oncoming street car and was injured by the latter. He was held not to be a trespasser, although the track was on an unpaved side of the street. The railway was held responsible for the injuries it caused to him. [Ohio Valley E. R. vs. Payne, 3 S.W. (2d), 223.]

OHIO—*Negligence per se for Automobile to Drive on Left Side of Road.*

An automobile while being driven on the left side of the road early in the morning of a December day was struck by a trolley car going in the opposite direction. The action of the automobile driver in being on the wrong side of the road was held negligence per se. [Cleveland Ry. vs. Kuncic, 160 N.E., 734.]

PENNSYLVANIA—*Workmen Struck by a Car While They Were Unloading Planks.*

Workmen who were unloading planks from a wagon and observed a street car approaching but swung a plank around so that it protruded in front of a car at the instant the latter arrived and were injured were held guilty of contributory negligence. [Haskin vs. P. R. T. Co., 140 A., 547.]

WEST VIRGINIA—*Railroad's Consent to Crossing Tracks at Grade a Consideration.*

An agreement between a steam railroad and an electric railway provided that the latter should install a crossing over the tracks of the former and should keep the crossing in repair. After this had been done for some 25 years the electric railway brought suit to require the railroad to pay half the cost of maintenance. The court held, however, that the permission of the railroad to cross its tracks was a valid consideration for the street railway's agreement to install and maintain the crossing. [S., E. L. & B. V. Traction Co. vs. Pittsburgh, C. C. & St. L. R. Co., 142 S. E., 257.]

Personal Items

Central Public Service Personnel

Review of careers of men in charge of railway properties formerly run by American Gas & Electric Company

RECENT railway acquisitions by the Central Public Service Corporation of Chicago, Ill., have brought to light the names of several officials who

W. B. Brady

are playing big parts in this organization's expansion program. Outstanding among these is William Burke Brady, vice-president in charge of the Central Public Service Corporation's electric railway properties. Others are C. B. Short, district manager Roanoke Railway & Electric Company; F. W. Samworth, district manager Ohio Valley Electric Railway, Huntington, W. Va.; C. T. Long, manager Portsmouth Public Service Company, Portsmouth, Ohio; D. C. Frost, manager Lynchburg Traction & Light Company, and M. T. Griffin of the Five-Mile Beach Electric Railway, Wildwood, N. J.

In Charge of Seven Subsidiaries

Early in his career Mr. Brady drifted away from the railway business and traveled extensively abroad. For some time now he has been back in charge of the several railway subsidiaries of the Central Public Service Corporation, including the Interstate Motor Transit Company and the Cannon Ball Transportation Company. Mr. Brady was born in Harrisburg, Pa. He attended Lehigh University, at Bethlehem, Pa., and Johns Hopkins University, at Baltimore. After college he began work in the line division of the Brooklyn Rapid Transit Company, spending several years with this company in various departments. He also served with the Westinghouse Company at East Pittsburgh and later became designing engineer for the Brown Hoisting Machinery Company. Still later he was affiliated with the National Carbon Company, with which he became superintendent in charge of production.

C. B. Short, manager at Roanoke, entered the employ of the Roanoke Railway & Electric Company as stenographer to the general manager in 1907. A few years later he was made claim agent. In 1917 he left the service of the company, but returned on Jan. 1, 1924, as assistant to the general manager. Two years later he was made assistant general manager and this position he occupied until the Central Public Service Corporation acquired the property early this year, at which time he was made manager.

D. C. Frost, manager at Lynchburg, Va., has been connected with the Lynchburg Electric Railway & Light Company since May 15, 1899. This company was then operating six cars and had a few lighting customers. In 1900 it was merged with the Lynchburg & Rivermont Street Railway under the name of the Lynchburg Traction & Light Company and Mr. Frost was retained as superintendent of the entire system. At that time the company operated twelve cars and the management of the railway fell to Mr. Frost. These two properties were held by various holding companies, the last one being the American Gas & Electric Company. On March 14 Mr. Frost was made manager of the railway properties in Lynchburg, which were still operated under the name of the Lynchburg Traction & Light Company. Since the American Gas & Electric Company sold to the Chicago Public Service Corporation the railway properties in Lynchburg early this year Mr. Frost has had entire charge of the Lynchburg Traction & Light Company in Lynchburg.

M. T. Griffin

C. T. Long, manager of the Portsmouth Public Service Company, Portsmouth, Ohio, entered the electric railway field in 1914 as valuation engineer for the American Railways, remaining in this position until 1917. For the next two years he served with the Engineers, U. S. A., and from 1919 to 1922 was engaged in valuation of electrical properties in Reading, Philadelphia, Grand Rapids and Mobile. He returned to the American Railways (afterward the American Electric Power Company) and in 1922 was in charge of the appraisal of the Consolidated Power & Light Company; the Ohio Valley Electric Railway, Boyd County Electric Company and later was appointed construction engineer at the Kenova Power Plant of the Consolidated Power & Light Company. He remained in this position after the purchase of the American Electric Power Company by the American Gas & Electric Company.

C. B. Short

After the purchase of the Portsmouth Public Service Company by the American Gas & Electric Company in 1925 he was transferred to that property as resident engineer and remained in that capacity until Dec. 30, 1927, when the property was taken over by the Central Public Service Company. On that date he was promoted to the position of district manager of the Portsmouth Public Service Company. Some months later his duties were extended to include the local management of the Cannon Ball Transportation Company and the Interstate Motor Transit Company.

Mr. Long was graduated from Lafayette College as civil engineer in 1900. For the next fourteen years he engaged in the location, construction and valuation of railroads.

Marion T. Griffin, manager of the Five-Mile Beach Electric Railway, Wildwood, N. J., began railway service with the Southern Pennsylvania Traction Company as pit man in 1916. He advanced in the mechanical department of that company to the position of foreman of the armature room. In 1921 he accepted the position of master mechanic of the Five-Mile Beach Electric Railway and two years later was promoted to the position of superintendent of the company. Early in the present year when the railway was sold by the American Gas & Electric Company to the Central Public Service Corporation, he was selected to manage the affairs of the railway.

Mr. Griffin was born in Maryland June 30, 1895.

Digitized by Google

The careers of Adam Gschwindt, who manages the Rockford properties, and of Fred Samworth, in charge of the Ohio Valley Electric Railway at Huntington, were reviewed in ELECTRIC RAILWAY JOURNAL, issues of May 5 and June 2 respectively.

C. A. Coons Appointed to Springfield Post

Charles A. Coons, formerly general superintendent of the United Traction Company, Albany, N. Y., and previous to that superintendent of transportation of the International Railway, Buffalo, has been appointed assistant general manager of the Springfield Traction Company, Springfield, Mo. Mr. Coons has spent his entire business career in the street railway field, beginning with the Buffalo Street Railway as a horse-car driver in 1890 and continuing through until he reached the office of superintendent of its successor, the International Railway.

The Springfield Traction Company operates upwards of 50 cars and 14 buses in a city of about 60,000 population.

Messrs. Coffield and Swift Promoted on Providence Property

Edward J. Coffield, formerly superintendent of the Woonsocket Division of the United Electric Railways of Rhode Island, assumed the duties of superintendent of the North Main Street division in Providence on July 1. He was promoted to the position to fill the vacancy caused by the death of F. H. Brown of Pawtucket. Entering the service of the United Electric Railways in 1907 as a conductor, Mr. Coffield successively became motorman, dispatcher, and inspector. He was appointed to the Woonsocket division in 1923. During the war he served in the army. Everett A. Swift, formerly an inspector in Providence, succeeds Mr. Coffield. Mr. Swift started with the company in 1904 as a motorman. In 1923 he was made inspector, serving on several lines. He has also been inspector at a bus terminal in Providence.

GOVERNOR JACKSON of Indiana, has reappointed Frank T. Singleton, Martinsville, Ind., to another four-year term as a member of the Indiana Public Service Commission. Mr. Singleton is expected to retain for the time being his post as chairman of the commission, in which capacity he has served the past year. Mr. Singleton was appointed to the commission on July 1, 1924, by Emmett F. Branch, then Governor. Mr. Branch was one of the many who recommended that Mr. Singleton be retained. For twenty years Mr. Singleton was a newspaper publisher of Martinsville. He served as secretary of the Indiana Republican Editorial Association for several years and long had been active in political and civic affairs of his community. He was postmaster at Martinsville.

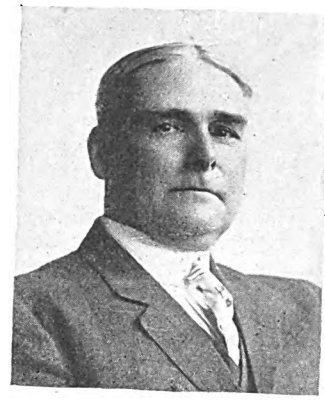
Obituary

T. B. MacRae

Well-known accountant and participant in A.E.R.A. affairs—Entered railway field forty-six years ago

With his term of service as president of the Accountants' Association of the A.E.R.A. not yet completed T. B. MacRae, auditor of the Chicago Rapid Transit Company and well known throughout the industry, died on July 3. Mr. MacRae has been identified with the railway interests since 1882.

In the mid-western section of the country Mr. MacRae got his start, and in that locality he was to distinguish himself as one of the foremost accountants in the electric railway industry. He began his railroad career with the Chicago & Northwestern Rail-



T. B. MacRae

road in the freight office in Cedar Rapids, Iowa. After three years there he entered the freight auditor's office of the Burlington, Cedar Rapids & Northern Railroad. His talents were soon discovered and he later was appointed traveling auditor and, still later, chief accountant in the general auditor's office. It was his lot to close the books of the Burlington, Cedar Rapids & Northern Railroad when that property was taken over in 1902 by the Chicago, Rock Island & Pacific Railway. He remained with the Rock Island Lines three years, later being elected auditor of the Metropolitan West Side Elevated Railroad.

The first real honor came to him in 1911 when the four elevated railroads operating in Chicago were brought under a unified management and Mr. MacRae was elected auditor of the individual companies. These four companies were consolidated on Jan. 1, 1924, under the corporate name of the Chicago Rapid Transit Company and he was elected auditor of the consolidated company. It was because of his varied experience in accounting practice and procedure that Mr. MacRae had long stood so high in the councils of the American Electric Railway Accountants' Association.

Mr. MacRae was born in Jackson, La. He was educated in private schools and at the United States Military Academy.

W. S. Whitney

W. S. Whitney, assistant general freight and passenger agent of the Union Traction Company of Indiana, died on June 21 in Muncie, Ind. Twenty-two years ago Mr. Whitney entered the traffic department of the Ohio Electric Railway, Cincinnati, Ohio, serving in the capacity of general freight agent and general passenger agent. After the reorganization of that property following receivership he remained with its successor, the Indiana, Columbus & Eastern Traction with headquarters in Springfield, Ohio. Prior to this connection he had been in steam railroad service, working in various capacities in the traffic and accounting departments. Mr. Whitney was president of the Central Electric Traffic Association in 1912-1913. He was 73 years old.

GEORGE S. BAXTER, a railroad contractor for many years, died on July 2. He constructed the foundations for the Second and Third Avenue elevated lines and built the New York Central's elevated structure on Park Avenue, New York City, north of 96th Street. Mr. Baxter became a cashier for the Northern Pacific Railroad in 1879, and remained in the railroad's employ for sixteen years, rising to the office of treasurer. He was born in New York in 1845 and was graduated from Williams College and from the Columbia University School of Engineering. For ten years following his graduation he did engineering work for mines and railroads.

CLYDE MARTIN, affiliated with the White company, died recently in Minneapolis. He was formerly associated with the Northern Ohio Power & Light Company, Akron, Ohio. Mr. Martin began as a trainman, was assistant claim agent and later was head of the securities department of the Ohio company.

JOHN B. THOMAS, identified with the Westinghouse Company for the last 52 years, died at Pittsburgh, Pa., recently. At the time of his death he was assigned to special duty with the company. Mr. Thomas entered the employ of the Westinghouse Company in February, 1876. In 1886 he was sent by George Westinghouse to Paris to manage the French branch of the air-brake company. He returned in 1888 and was transferred to the Westinghouse Electric & Manufacturing Company.

Manufactures and the Markets

Detroit Orders 25 Buses

Twenty-five 40-passenger buses have been ordered by the Detroit Street Railways, Detroit, Mich., from the American Car & Foundry Company, Detroit.

Delivery will start in about three months. Bids were received and opened in February in response to a request by the commission, and the low bid was submitted by the Detroit concern of approximately $10,500 for each bus.

Whether the type of bus will be gasoline or gasoline-electric has not been definitely decided, that question being left open pending the recommendation of William B. Mayo, consulting engineer for the commission. The particular lines on which the buses will be put into operation have not yet been determined.

Tygarts Valley Traction Company Plans Improvements

Tygarts Valley Traction Company, Grafton, W. Va., plans improvements to cost several thousand dollars, including the extension of service to Blueville, a suburb. Plans and specifications for the extension have been completed and will be forwarded at once to the state road commission, which seeks to ascertain the location of tracks with relation to the route of the northwestern turnpike through the village. A 60-ft. highway there is fixed and possible condemnation proceedings will have to be taken to provide a right-of-way for the railway lines.

A.C.F. Fiscal Year Report

Report of American Car & Foundry Company and subsidiaries for year ended April 30, 1928, shows net income of $3,754,555 after charges, federal taxes, etc., equivalent after 7 per cent preferred dividends, to $2.75 a share earned on 600,000 shares of no-par common stock. This compares with $4,593,377 or $4.15 a share in preceding year. After payment of dividends there was a deficit of $1,945,445, against deficit of $1,106,623 in preceding year.

Consolidated income account of American Car & Foundry Company, American Car & Foundry Securities Corporation and American Car & Foundry Export Company for year ended April 30, 1928, is shown in the accompanying table.

	1928	1927
*Profit	$6,590,056	$7,837,527

Tacoma Carhouses and Cars Destroyed

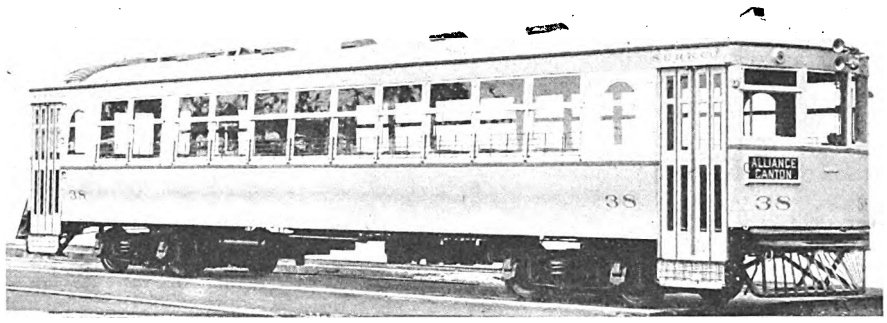
Recently a fire completely destroyed the newly constructed carhouses on the tideflats, and 21 street cars of the Tacoma Municipal-Belt Line, Tacoma, Wash., with damage estimated at $90,000. No replacement plans have as yet been announced.

Nineteen of the 21 cars were recently overhauled, and were ready to be re-

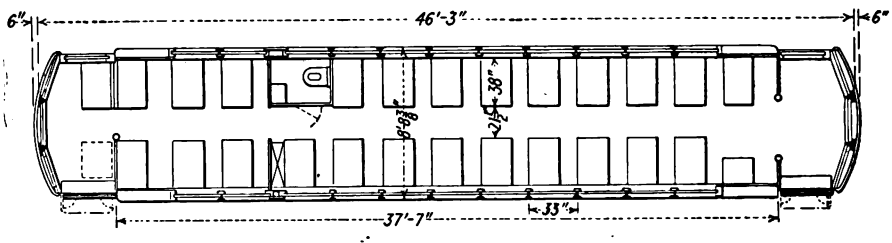
Alliance Cars Delivered

Three one-man interurban motor passenger cars were delivered May 22 to the Stark Electric Railroad, Alliance, Ohio, by the Cincinnati Car Company, Winton Place, Ohio. The cars were ordered on Feb. 6 as mentioned in the Feb. 18 issue of the JOURNAL. They are of the single end, double truck type and seat 52 passengers.

The cars are of semi-steel construction with arch roofs. They are 47 ft. 3 in. long, 8 ft. 8⅜ in. wide and weigh 33,640 lb. The finish is in lacquer, the exterior cream and the interior trim in cherry. The seats in the main passenger compartment are full spring edge construction, canvas covered with removable linen covers. The smoker compartment seats are upholstered in gray Spanish leather. Other details may be found in the accompanying specifications:



One of the cars recently delivered to the Stark Electric Railroad



Plan of seating arrangement of Alliance cars

Weights: car body	16,170 lb.
Trucks	8,880 lb.
Equipment	8,590 lb.
Total	33,640 lb.
Bolster centers	27 ft. 7 in.
Length over all	47 ft. 3 in.
Length over body posts	37 ft. 7 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8⅜ in.
Height, rail to trolley base	10 ft. 10 ¼ in.
Window post spacing	33 in.
Body	Semi-steel
Roof	Arch
Doors	End, folding
Air brakes	General Electric single end with safety feature
Armature bearings	Plain
Axles	Bethlehem hammered open-hearth
Car signal system	Faraday
Compressors	General Electric CP-27
Conduit	Flexible
Control	K-35-JJ with DB line breakers
Curtain fixtures	National Lock Washer
Curtain material	Double-faced Pantasote
Destination signs	Perforated sheet metal
Door mechanism	National Pneumatic
Fare boxes	Cleveland No. 9
Finish	Duco
Floor covering	Linoleum under seats
Gears and pinions	General Electric heat treated
Glass	Plate
Hand brakes	Cincinnati aluminum vertical wheel
Heaters	Consolidated
Headlights	Electric Service Supplies Company T-1419
Headlining	¼-in. Agasote
Interior trim	Cherry
Journal bearings	Plain
Journal boxes	Cincinnati cast steel
Lamp fixtures	Overbaugh-Ayers reflector, Bryant shade holder
Motors	Four GE 265, outside hung
Painting scheme	Cream
Roof material	Wood, canvas covered
Sash fixtures	Dayton Manufacturing Company
Seats	Hale-Kilburn Company
Seat spacing	33 in.
Slack adjusters	Cincinnati turnbuckle type
Steps	Folding
Step treads	Cast aluminum.
Trolley retrievers	Ohio Brass No. 13120
Trolley base	U. S.
Trolley wheels	Bayonet
Trucks	Cincinnati passenger type arch bar
Ventilators	Nichols-Lintern type C
Wheels, type	Rolled steel, 28 in. diameter
Pilot	Stee

painted. Of the entire belt line system only two cars were saved.

Until arrangements are made to replace the cars, the city will use the Tacoma Railway & Power Company's cars. The city's substation near the carhouse was also damaged to the extent of several thousand dollars.

$60,009 for Old Railway Equipment in New York

Metal dealers and representatives of electric railway equipment firms were among bidders at an auction sale conducted recently by the Department of Plant and Structures of New York City, to dispose of equipment of the discontinued Staten Island trackless trolleys and the Staten Island Midland Railway. Commissioner Goldman announced total receipts of $60,009.

Poles and wiring of the trackless system brought a high bid of $44,100 from the Allite Corporation of 654 Broadway, New York City. The Century Metal Company was a high bidder with $4,400 on 33,968 lb. of copper wire.

Among other high bidders were: G. T. Abel, $2,500 for substation equipment; S. Simon, $2,672 for motors, wire and scrap metal; P. Griffiths, $2,350 for old wire; and D. Groscia, $1,555 for scrap iron and old rails.

Would Register Bidders on State Work

A standard registration act for the handling of records in connection with public construction work is being drafted by the Associated General Contractors and will be submitted to the legislatures of the various states. Under the terms of the proposed bill all persons bidding on state work would be registered. It would be the duty of the board administering the act to investigate the previous work done by the bidder. In the case of default the name of the contractor would be dropped from the registration list for a period of two years. In connection with the proposed legislation the general contractors will recommend that the members of the registration board be chosen from the ranks of experienced engineers and architects of such standing in the community as to be above political influence. The proposed legislation is an effort to eliminate the irresponsible and unscrupulous contractors from those who may bid on public works.

Meagher Heads Springfield Purchasing Agents

J. B. Meagher, purchasing agent of the Indiana, Columbus & Eastern Traction Company, has been elected president of the Springfield Purchasing Agents' Association, Springfield, Ohio. Mr. Meagher succeeds G. R. Muzzy. Other officers elected are Vice-president, P. J. Schneider; secretary, H. C. Laybourne; treasurer, C. C. Bishop; national director, G. R. Muzzy, and local director, H. A. Legge.

Duty on Brick Imports Asked

Importation last year of 110,000,000 brick at the port of New York alone, has aroused the domestic industry which is demanding relief in the form of a duty on imports. At present building brick is on the free list. Protests which have reached Washington have been answered to the effect that a revision of the tariff must be awaited before an effort can be made to secure the relief asked. While the President may increase or lower the rates of duty, he is given no authority over the free list, under the flexible provisions of the act.

TRACK AND LINE

Seattle Board of Public Track and Line, Seattle, Wash., has awarded a contract to John A. Roebling's Sons' Company to furnish 10 miles of 00 hard-drawn trolley wire at $17.35 per hundred.

Chicago Rapid Transit Company, Chicago, Ill., will elevate its tracks in the city of Evanston, from Clark to Isabella Streets, a distance of about 1½ miles. This will complete the elevation through the entire city of Evanston.

Detroit Street Railways, Detroit, Mich., on July 7 put into operation its new car line from Michigan and Wyoming Avenues to the Fordson plant of the Ford Motor Company.

Holyoke Street Railway, Holyoke, Mass., is building 1 mile of new macadam road to afford a better entrance for motorists into Mountain Park.

Northern Ohio Power & Light Company, Akron, Ohio, is installing double track on Cornell Street in Barberton.

TRADE NOTES

Gunite Corporation, Rockford, Ill., has appointed A. N. Willsie, formerly with the Locomotive Stoker Company, in charge of railway sales.

English Electric Company of Canada, Ltd., is proposing a rearrangement of its capital structure with a view to placing itself in a stronger financial position and relieving itself of dividend arrears on preferred stock as well as reducing the fixed charges imposed by the preferred dividend rate of 8 per cent. Instead of existing preferred and common stock, the proposed plan provided for class A and class B shares. For each share of preferred stock, a holder will receive two shares of the new A stock and one-half of the new B stock. For every share of common, a holder will receive one share of the new B stock. The A stock, according to the plan, will be placed on a $3 per annum dividend basis immediately.

Motor Wheel Corporation, Lansing, Mich., is adding a $100,000 addition to its pressed steel plant.

Chisholm-Moore Manufacturing Company, Cleveland, Ohio, recently purchased by the Columbus McKinnon Chain Company, Tonawanda, N. Y., will hereafter be known as Chisholm-Moore Hoist Corporation (division of Columbus McKinnon Chain Company). At a recent meeting the following directors and officers were named: Directors, Julius F. Stone, Julius F. Stone, Jr., J. C. Dunn, A. L. McKinnon and Frederick Mitchell. Officers: Julius F. Stone, president, Julius F. Stone, Jr., vice-president; J. C. Dunn, vice-president and treasurer; Frederick Mitchell, secretary.

ADVERTISING LITERATURE

Engineering & Mining Journal, New York, N. Y., has issued a booklet describing its Market and Quotation Service on metals and non-metallic minerals.

Thompson Electric Company, Cleveland, Ohio, has published a booklet entitled "Standardization and System" including description of Thompson hanger and shock absorber for industrial lighting installations.

Curtin-Howe Corporation, New York, N. Y., announce the appointment of Kenneth M. Bailey as technical sales representative at New Orleans, La.

Ohio Brass Company, Mansfield, Ohio, has issued a bulletin describing its trolley bases, trolley catchers and retrievers, trolley wheels and harps, sander equipment, automatic car couplers and headlights.

Sullivan Machinery Company, Chicago, Ill., has issued a new Bulletin No. 83-J, descriptive of Sullivan angle compound power-driven air compressors of capacities from 300 to 5,100 cu.ft. of free air per minute.

Fuzon Welding Corporation, Chicago, Ill., has issued a bulletin descriptive of Fuzon Welders.

Gunite Corporation, Rockford, Ill., has published a booklet describing its new graphite steel gunite.

American Car & Foundry Motors Company, New York, N. Y., has published a catalog describing its Metropolitan, 40-passenger, all-steel coach.

Telling One's Story Not Exclusive Right of Political Propagandist

HIS methods of defense may not always be the best, but that man is a craven who does not jealously guard that which he sincerely thinks is his own best interest. And that appears from the testimony before the Federal Trade Commission at Washington to be where many of the utilities were over-zealous. Certainly they were not secretive. Often they conjured up the existence of a menace where none actually existed. It does seem, however, as one of the commentators put it, that the utilities in many cases paid a tremendous price for trash-basket circulation. That does not mean that the utility clip sheets were not informative. Many of their items have real news value simply because the authors of them have access to information not always available to the outsider. When it comes to the so-called propaganda of pamphlet, textbook and lecture, however, the effect has been likened to the discharge of a battery of machine guns at the ocean. The development of public utilities by private capital has an honorable record. The telling of the utility story, however, has been befuddled, but so has the telling of the story of the present inquiry since publicity given to isolated and scattered portions of the record has resulted in misleading impressions.

It is easy to suggest the exercise of restraint, but it is not so easy to practice moderation of expression when a great industry is harried by jackals ever ready to tear down, in the guise of public interest, the constructive work of other men's hands. Properly to sting the self-appointed guardians of the public interest who have made a great pother about some of these misguided publicity activities would require the scorpion touch of a Brann. Not that some of these utility activities were not ill-advised, for men appear to have been vested by the utilities with power they could not be trusted to exercise wisely. Two wrongs don't make a right. But truth has become strangely distorted and grotesque in the hands of some of the advocates of nationalized industry and government competition with private enterprise. Are the leagues for this and the leagues for that, totally irresponsible and unchecked, and aided and abetted by the Pinchots and the Norrises, to be permitted to say what they would without contravention? That is unthinkable.

One thing is certain. The utilities may in some cases have erred through excessive zeal, but most of them are furnishing incomparable service at terms distinctly advantageous to the customer, judged by any standards of comparison that are available, certainly judged by any standards of municipal enterprise. This is a service they can well afford to talk about in paid space. The telephone company does it in its own forceful way. The light and power utilities and the railways have done so in the past. Just so long as the utilities continue to furnish a class of service which is advantageous to the public, they are more than justified in telling the public about it, and in calling attention to the fallacy of political theories that would endanger that service. Telling one's story is not the exclusive right of the political propagandist.

N.A.C.C. Has Accepted Responsibility to Do Something Constructive

SINCE the attempt to obtain passage of the Parker bill providing for the regulation of buses in interstate service failed in this past session of Congress, the subject of interstate regulation has come up for discussion before two national groups, representing interests that would nominally be assumed to hold opposite views of the situation. These were the Motor Transport Division of the American Railway Association, at its recent annual meeting in Atlantic City, and the Motor Bus Division of the American Automobile Association, which held its annual meeting in Cincinnati, June 27-30. At both these meetings spokesmen for the respective industries represented deprecated the attitude of those who had opposed the Parker bill, and who are generally held to be accountable for the failure to obtain interstate regulation for at least another year.

Representatives of the National Automobile Chamber of Commerce responded to the challenge, stated or implied, that the activities of that body had been responsible for the postponement of regulation. In both meetings the answer was similar; namely, that the N.A.C.C., while not favorable to some of the provisions of the Parker bill, is not opposed to the principle of regulation of interstate buses in the public interest. A. J. Brosseau, speaking before the American Railway Association as chairman of the legislative committee of the N.A.C.C., went farther than did E. F. Loomis, secretary of the N.A.C.C., before the bus division meeting of the A.A.A. in Cincinnati. Mr. Brosseau intimated that opposition to proposed regulatory legislation was based on the fear that, in addition to regulation, the proposed legislation threatened a "shut-out," as he expressed it, for the automotive vehicle.

So much, then, for developments up to date. The proposed bill, which represented the best efforts of the National Association of Railway and Utility Commissioners, the American Railway Association, the Bus Division of the American Automobile Association and the American Electric Railway Association to agree on a regulatory measure which would meet the common views of all these groups, was opposed before the Congressional committee by representatives of the N.A.C.C., and its failure to get by that committee is generally attributed to the position taken by the automobile manufacturer's association. This paper holds no brief for the Parker bill. That measure did, however, seem to be drawn in a spirit of co-operation, and was worked out and modified to suit the views of the several interests represented. Consequently, since the need for regulation is admitted

Digitized by Google

even by spokesmen for the N.A.C.C., it seems obvious that in taking the position it did before the Congressional committee, that body has automatically assumed a grave responsibility to the operators of buses. It is particularly significant that the strongest expression of condemnation of the N.A.C.C. attitude was voiced not by a railroad man but by the chairman of the legislative committee of the American Automobile Association's Bus Division.

Everyone seems agreed on the need for interstate regulation. Apparently, also, all of the principal interested groups, with the exception of the N.A.C.C., are agreed on the form and extent of the regulation. Although there were repeated efforts made to have the situation thoroughly thrashed out while a bill was in process of formulation, the N.A.C.C. chose to take a hand only when the matter reached a Congressional committee. In doing that it has definitely assumed the responsibility in the eyes of railway men and of bus operators as well, of proposing something to take the place of the measure to which it objected. It is all very well for N.A.C.C. spokesmen to express accord with the general idea of regulation and to voice a desire to sit down with other interested groups to discuss a basis for a regulatory law. Just why that desire was not expressed during the long period that the Parker bill was under discussion and in process of formulation by all the other groups interested is hard to understand.

Presumably, since the N.A.C.C. finds itself opposed to the views, not only of the railroads but of the Bus Division of the American Automobile Association, it feels that the interests of bus manufacturers are not identical with those of bus operators, or that the A.A.A. Bus Division does not adequately represent the many small as well as large interstate operations that have sprung into existence since the bars were let down on buses in interstate service. Certainly, it is equally as important from the manufacturer's standpoint to protect the interests of the certificated intrastate operator who has already made a large investment in buses, as it is to protect the prospective interstate customer for buses from a "shut-out" due to over-stringent regulation.

It is high time to put aside the smoke-screen of glittering generalities, such as "agreement on the need for regulation," and the "desire to sit down to talk it over." All of the other groups involved have been sitting down and talking it over for some time. What seems needed most right now is a definite statement from the N.A.C.C. of just what it would consider advisable in the way of interstate regulation. Then there would at least be the opportunity of judging just how far that body is willing to go, and how much discussion is necessary before something really constructive can be done.

A Contest Where Everyone Wins

FEW things done in recent years have had an effect in the cause of safety so profound as that of the contest for the Anthony N. Brady memorial medals conducted last year. While the medal was open for competition several years ago, the conditions of the award were so different that the earlier contests were not to be compared with that conducted in 1927. The plan adopted last year of dividing the contestants into three classes, consisting of large, medium and small properties, made it possible for each company entered in the competition, regardless of size, to participate on even terms in the race for honors.

It is gratifying that the award will be given again this year. The same committees on award and on conditions of the competition have consented to serve again, so that careful consideration will be given to all points. According to the plan as announced, safety will not be judged only by the concrete figures of passengers carried or miles run per accident. As in the contest last year, consideration will be given the far more significant items of the success in gaining good will through the development of good safety practices, the improved safety conditions which have resulted from original ideas, the adoption of new developments in safety, particular success in conducting a safety campaign, and outstanding accomplishments in development of co-operation between employees and management in safety promotion, sanitation and health.

There still is much room for better methods of safety promotion and for results that are of still greater value in conserving life. Practice of safe methods does have a real money value, since accident costs are a not inconsiderable part of the total in many properties. There is thus an incentive for each company in the industry to make the best showing possible in everything connected with safety. Whether or not a prize is won this is a contest in which there is no chance to lose, for the satisfaction of promoting safety is in itself a great reward.

Getting on the Band Wagon

WHILE members of the Central Electric Railway Association who attended the recent Cedar Point meeting must have returned to their homes beset by conflicting emotions, there was a spirit of optimism predominant. The atmosphere of gloom that continued well through the first morning's session was dispelled under the influence of indisputable facts, figures and statements presented. An old-fashioned experience meeting took place, with a scramble of all present to get onto the band wagon of optimism. Certainly the attitude of the leaders was most encouraging, and when the delegates had had time to pass sober judgment upon the situation on their own and their neighbor's properties it was evident that affairs might be much worse. While passenger traffic in the Central States, generally speaking, shows a decrease it is proportionately less than in years past. In fact, the downward tendency in passenger traffic seems to have been checked. By better merchandising and a little closer study of public demand the tide may be turned.

The reason for poor traffic on certain properties is all too apparent to a casual observer. Despite notable improvements on some properties, improvements that have in practically every instance been followed by increased earnings, much remains to be done, taking the territory as a whole. There are still too many miles of weed-grown rights-of-way, too many sagging trolley poles, too many dilapidated waiting stations, too many decrepit cars, too many discouraged and slovenly trainmen. These factors have all been an influence in driving away traffic. When they are corrrected the swing in the other direction will begin. An entire generation, educated to ride on rubber, has grown up in this country, but there are still thousands upon thousands of people to whom the electric railway is no less valuable today than it was when first constructed. It is at these people that sales effort must be aimed. They are the first to respond to any evidence of improved service and the

Digitized by Google

ones who will most certainly attract others to the cars, both as riders and as shippers.

It is in discussing the freight situation that the operator in the Central territory is inclined to become enthusiastic. With notably few exceptions freight earnings there have been on the increase over a period of years.

On some important properties freight now constitutes a major portion of the gross business, with excellent prospects for further gains in the future. Even in this department there is a serious question as to whether the managements are doing everything possible to get all the business that may be developed. Local jealousies, local prejudices, unwillingness to exchange ideas, a disposition to play dog-in-the-manger often stand in the way of improvements and better relations. Electric railway freight service is of extreme importance to the industrial fabric of the Mid-Western territory, and the possession of a piece of strategic trackage imposes an obligation that should go far beyond the position or disposition of the operator who happens to control it. No local advantage so secured should be allowed to weigh against the interest of the industry taken as a whole.

Once the ice was broken the assembled delegates displayed a commendable disposition to talk over their troubles freely and to discuss ways and means of correcting them. The meeting of the Central Electric Railway Association held at Cedar Point was notable from any standpoint, the more so because of the impressive demonstration of the manner in which the spirit of gloom was dissipated when confronted by the unmistakable evidence of the causes for optimism.

"Ads" That Win Patronage and Prizes

EDUCATION appears to be the underlying thought back of the newspaper advertisements of the Georgia Power Company, The Portland Electric Power Company and the Twin City Rapid Transit Company, awarded first, second and third place respectively in the Better Copy Contest conducted by the Public Utilities Advertising Association. These "ads" received due recognition at the July 10 session of the International Advertising Association meeting which was held in Detroit.

"My job means something to me" was the arresting headline of the Georgia Company's advertisement. To some this expression may sound too fulsome. However, the "ad" performs the double function of speaking to employees and the public simultaneously. The modern trainman, changed physically and mentally, is gradually emerging. What more appropriate than that his company tell the public about it?

In the advertisement of the Portland Electric Power Company the company envisages itself as an educational force. Through a comparison, though not an invidious one, of the automobile and street car, the copy suggests when to use the trolley and when to use the family car. It induces rather than demands. Thus it escapes the criticism which might ensue from the slightly dangerous appeal in making comparisons. The Twin City Rapid Transit Company shows the public that progress and prosperity are indissolubly linked with the street car and its ability to extend its services.

All three advertisements, reproduced elsewhere in this issue, can be considered attention-getters in their pictorial and type appeal. But more significant is the testimony they bear to the changed psychology in the railway business towards better advertising. It is no longer debatable—advertising wins rides, since the product is inherently necessary and worth while. But railway companies must not only advertise; they must have a real message to tell and must use the best media available. Incidentally, in this contest newspaper advertisements captured all the winning places. This better copy movement deserves hearty indorsement and support. It promises to become a strong force in putting public utility copy in the class of simple, timely, well-poised and convincing advertisements.

Brooklyn-Manhattan Transit Dissolves Its Voting Trust

VARIOUS reasons are ascribed to the proposed dissolution of the voting trust under which the Brooklyn-Manhattan Transit Corporation has been conducted since the reorganization of the company in 1923. The reason popularly ascribed is that the termination of the trust is precedent to the conclusion of negotiations by which the city is to take over the railway or a considerable part of it so as to tie the lines in with the system which the municipality is now building. It has been suggested by some that the dissolution of the trust and the application to list 249,468 shares of preferred stock, Series A, and 769,911 shares of common stock, both without par value, on the New York exchange is a step taken to establish a price for the sale of the properties to the city. That, of course, is conjecture. It may or may not be true.

There is no getting away from the fact, however, that the Brooklyn management has done wonders with that system. The career of the road was never more pleasant to contemplate than it is today from the standpoint of the patron and the owner. No stigma attaches to Colonel Williams for his inability to pull the system, run at a 5-cent fare, out of the doldrums of the war period when the balance of economic forces was seriously disrupted. Nor does the work of the present management, headed by Mr. Menden with Mr. Dahl in command and Albert Wiggin and Frederick Strauss as Mr. Dahl's companion trustees, suffer any by contrast with the wonderful work which Colonel Winter did before Colonel Williams in putting the system on its feet.

The reorganization of the B.-M. T. was drastic, but it was no more drastic than the circumstances warranted. Receiver Lindley M. Garrison did what he could, but to rehabilitate the road was not his job. His was primarily a work of conservation. But the system that the reorganized company took over from him has been raised to a physical status and is managed with a celerity few would have dared ten years ago to predict as attainable. Not only that, but the public relations have been improved immeasurably. That much of the success of the company in thus bettering its public relations may be ascribed to the presence on the board of directors of three representatives of the city seems reasonable, since these men are able to bring from the outside just the leaven needed. Even where the management has felt it incumbent to disagree with public officials, the matter has been handled wisely. And that is saying a great deal when it is taken into account that John F. Hylan was the incumbent of the Mayor's office for a part of this time, if only for a small part.

Cincinnati Completes

Model Car Shop

Structure built and equipped at a cost of approximately $1,186,000, has a floor area of more than 4 acres. Repair tracks are bisected by a transfer table within the building

By E. J. Jonas
Superintendent of Equipment Cincinnati Street Railway, Cincinnati, Ohio

COMPLETION of the new Winton car shop on March 24 marked another forward step by the Cincinnati Street Railway in its modernization program. Built at a cost of $986,322 and equipped at a cost of approximately $200,000, the structure represents the utmost in car repair facilities. It is a substantial structure of brick and steel, 400 ft. square and having a floor area, including balconies and basement, of 177,605 sq.ft., or more than 4 acres. It is located in the suburb of Winton, about 5 miles north of Fountain Square, the business center of Cincinnati, and is convenient to several car lines of the company.

The main building, which was started in July, 1927, is now being occupied, but most of the outside track remains to be built. The transfer from the old Chester Park shops was made without serious interruption to production, and the various functions of car repair work are now proceeding in the new shop in the manner as originally planned.

All departments are under one roof with the exception of a boiler house and a storehouse. These two are separated from the main building by an area 32 ft. in width. The transfer table runway extends the full length of the building under a 60-ft. roof span, so that all movements of cars under repair can be made under cover. Repair tracks adjoining the runway are just long enough to accommodate one car at a time, thus avoiding the necessity of shifting any car until all repairs under way on that particular track are completed. As there are but two doors through which cars can enter or leave the building the item of door maintenance is reduced to a minimum while at the same time the change in temperature during the winter which a multiple-door arrangement would produce is avoided. All machine work in connection with repairs is done at the rear of the tracks on which the cars have been run, reducing the distance between the machines and the cars under repair.

The routing of cars through the shop will depend on the nature of the work to be performed. A car undergoing general overhaul, scheduled on a 60,000-mile basis,

Digitized by Google

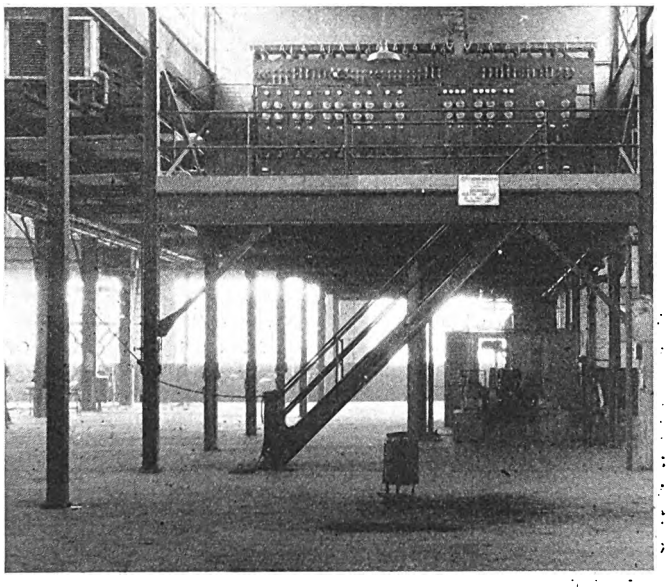
will enter first the sand-blast room. Here it is placed under a set of exhaust blowers suspended from the roof. These carry off all dust and dirt as the cleaning progresses. Through these blowers air is discharged at high velocity and is drawn through ducts in the floor, through a filter and dust arrester and into the blowers again. A circulation of 9,000 cu.ft. per minute is maintained. Air circulates through the interior of the car as it is cleaned of all loose dirt and dust with a high-pressure air hose. Paint is removed by sand-blasting.

Cars Leaving Sand Blast Are Washed

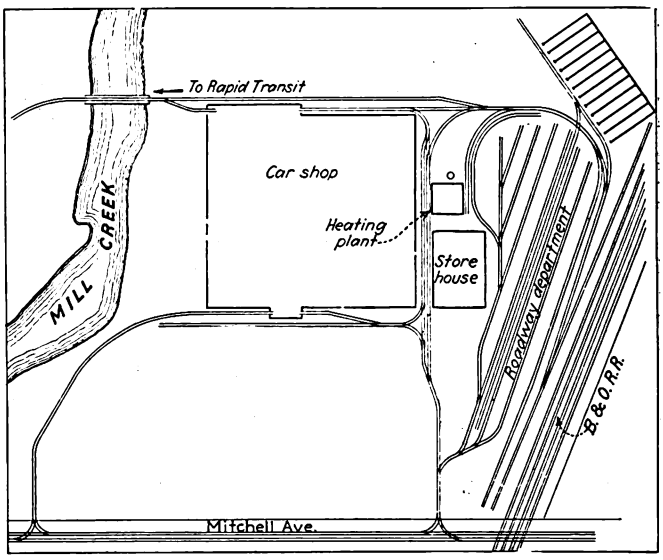
The car then passes to the wash track where water at a pressure of 200 lb. per square inch is used for cleaning the exterior of the car body and trucks. The next move is to the truck repair tracks. The body is raised from the trucks with a four-hook electric hoist, an integral part of the transfer table. Four 40-hp. motors, in series with a K-11 controller, drive the hoist. The trucks are removed from the car by a cable passing near a pulley and winch, also located on the transfer table. The car body is then set down on a pair of light shift trucks and placed on one of the body pair tracks. Each of the shift trucks is equipped with a light motor to facilitate this movement. In a balcony over the carpenter shop is space for seat, sash, register and farbox overhauling and for general light repairing.

Upon the completion of body repair work the car is moved to the paint department. All painting is done in a spray booth, this particular booth being a recent development of the De Vilbiss Company. A small De Vilbiss spray booth for signs is installed in the paint mixing room. It is planned to put a car through the paint shop in three days.

The tracks in the truck repair section are of sufficient length to permit work on two pairs of trucks at a time. Each track is served by a 2-ton electric traveling crane. A tool room, conveniently located near the machine section, is arranged to take care of small tools and has necessary equipment for the manufacture of dies and special tools. Finished trucks with motors are moved to the rear end of the truck repair track, are lifted by a 10-ton electric crane which travels parallel to the transfer table and are placed on a vacant track ready to be shifted under the car body when it emerges from the paint department.



The electrical department is located in this section of the shop. The switchboard on the balcony controls all light and power circuits of the shop



The plant has, in addition to the shop building, a boiler house, stores building and numerous outside tracks

Cars Are Thoroughly Inspected

The next move is to a pit track adjacent to the electrical department where brake rods and motor leads are connected and the equipment is given a final check and electrical test. Each car is given a thorough inspection before it is released from the shop.

As the movement of cars within the shop is, with few exceptions, limited to a car length from the transfer table, no overhead trolley wires are used, thus freeing all repair tracks from the hazard of high-voltage wires. The only 600-volt trolley wires in the shop are those directly over the transfer table. Power for moving cars off and on the table is supplied through a flexible cable, wound on an automatic reel and fed through a jack pole.

Attention was given to elements that would add to the comfort and safety of the workmen. Adjoining the office is a first-aid room equipped to handle minor injuries. It is planned to have one of the workers in the shop care for injuries that do not require surgical attention. A room 48x96 ft. with a 15-ft. ceiling, located above the office and locker rooms, is available as an assembly room. Provision has been made to equip this room at some future date as a cafeteria for the use of employees.

Spacious dressing and locker rooms on the main floor have 150 all-steel lockers, five Bradley washing fountains, five shower baths, toilets and drinking fountains. There are also four toilets and ten drinking fountains conveniently distributed at various points throughout the shops and storerooms.

The large office and drafting room has a northern exposure and has an air of cheeriness. A fireproof record vault adjoins the office.

A feature of the new plant is the extensive use of actinic glass in skylights and windows. The building was designed with continuous monitor roof, with alternate high and low bays and with the large glass areas in side walls allows a flood of natural light to enter in the daytime. The total glass area is equivalent to approximately 30 per cent of the floor area of the entire plant. The plant may be lighted electrically by lamps with

Digitized by Google

frosted globe reflectors which give an illumination of 10 foot-candles.

A concrete-lined subway connects the basement of the general stores building with the wheel, pipe, axle and lumber storage rooms in the basement of the main building. The storage room for wheels and other large parts measures 32x188 ft., while the 50x200-ft. basement beneath the carpenter shop allows ample and convenient storage for lumber as well as space for dust-collecting fans and ducts. The subway also serves to carry service pipes and wiring.

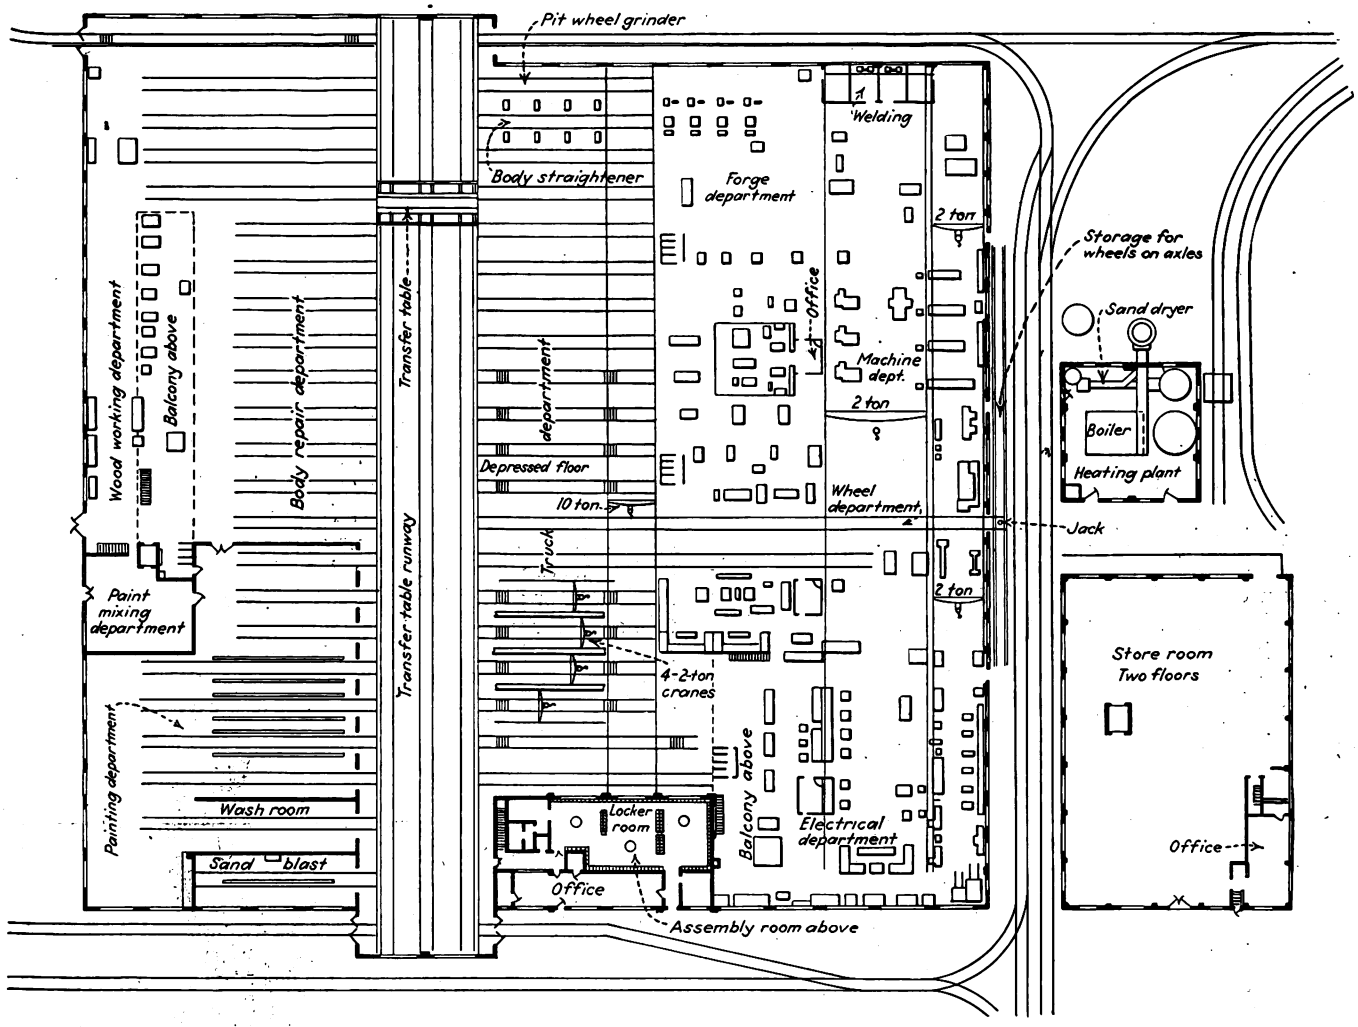
Two Warner heavy-duty automatic electric elevators are installed, one in the storeroom and one in the main building. In addition there is a hydraulic elevator to raise wheels and axles out of basement storage. A special track with offset rails is used for storing mounted wheels. An air jack, developed in the shops, turns the wheels and axles leaving the shop through 90 deg., so they may be placed on the storage track.

Cranes Facilitate Shop Work

There are four traveling cranes, serving 50 per cent of the machine and electrical department areas. These four and the cranes over the truck repair section have 2-ton electric hoists with three-phase, 440-volt motors. As the traveling cranes are not intended for transporting materials over any considerable distance, a 2-ton lift truck with portable platforms is used for this purpose. The truck can be readily moved into any department by the elevators, the subway or the ramps leading to the transfer table runway, whose floor is but 11 in. below the general floor level.

The floor of the transfer table runway is paved with concrete. In the wheel and truck departments, covering an area of 3,840 sq.ft., wood block paving is used. The floors of the machine and electrical departments, which cover 42,624 sq.ft., are of elastite.

In planning the shop consideration was given to the possibility of the company some day operating the rapid transit system which is now being constructed by the city of Cincinnati. A track connection with the rapid transit line, which is to pass within a short distance of the shops, has been arranged for. As the rapid transit line



Floor plan of the new Winton shop of the Cincinnati Street Railway. A transfer table runway, which serves 48 tracks, divides the main building into two parts. The shop corresponding to each repair section is located at the rear of the tracks of that section

FLOOR AREAS IN THE WINTON CAR SHOP

	Square Feet		Square Feet
Electrical department	13,056	Office	1,008
Wheel department	4,992	Locker room	2,752
Pipe department	3,072	Other areas	21,991
Sheet metal	3,062

Wood-working section which adjoins the body repair department. The section has a dust-collecting system for the many machines

is to be of standard gage and the system of the Cincinnati Street Railway is of 5-ft. 2½-in. gage, it was necessary to double-gage much of the trackage in the shop. This also permits the entrance of standard gage steam railway cars to the shop and yards. A standard gage track also has been laid along the area between the shop and the storehouse and boiler room to permit the entrance of steam road cars with coal, sand and other supplies.

All wiring is carried in rigid conduit. The service pipes and conduits, wherever exposed, are readily identifiable by a contrasting color scheme, the sprinkler system being painted red, cold water pipes blue, hot water pipes yellow, lighting and power conduits aluminum, gas pipes black, air pipes green, live steam pipes maroon and the vacuum and steam return system chocolate. The sprinkler system carries 210-lb. pressure.

The storeroom with its two stories and basement is of monolithic concrete. The building has separate offices for the storeroom attendants and a fireproof vault.

The boiler house is especially well designed in every detail. It has two boilers of the Tudor type, each with a nominal rating of 250 hp., fed by electrically-operated Riley stokers. The system is insulated so effectively that it is necessary to obtain heat for the building in the winter time from the flue gases. A unit heater system utilizing low-pressure steam from the boiler house is installed in the plant. Six fans and 46 unit heaters for the system were supplied by the American Blower Company. Each blower motor is thermostatically controlled to maintain a uniform definite temperature throughout the plant. Direct radiation is used in offices and to some extent in the paint shop. During hot weather, when the heating plant is not needed, the same system of blowers is used for ventilation.

Of special interest is the sand-drying apparatus. Sand

Spray exhaust hood in the paint shop. Fresh air is forced through the two slots in the floor by a blower fan and drawn from the hood above by an exhaust fan

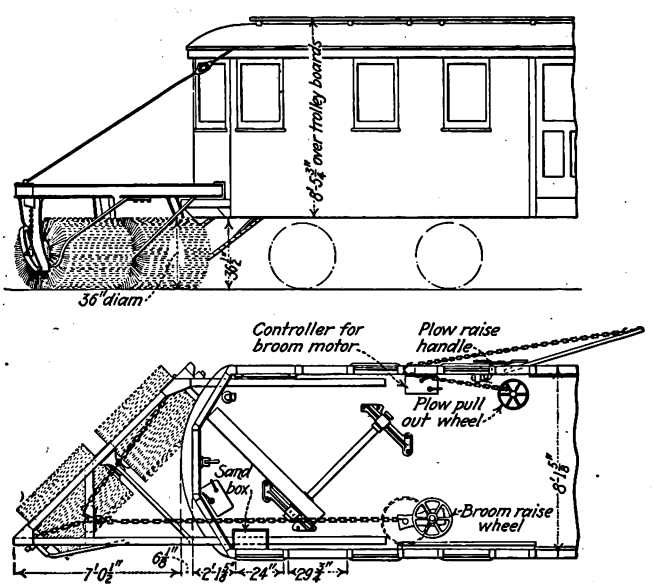
is brought into the plant in steam hopper cars and is dumped by gravity into a container adjoining the boiler house. The sand is then lifted by a conveyor into a 100-ton hopper within the boiler house, from which it descends to a revolving iron drum. The drum is 3 ft. in diameter and 25 ft. in length, is lined inside with baffle plates and is set at a slight pitch. As the sand moves through the drum, exhaust gases from the breeching are passed through it, removing all moisture. After passing through the sand the gases are drawn into the breeching again and pass out the flue. When the boiler is not in use a small direct-fired furnace furnishes the heat for drying. Before leaving the drum the sand is screened. The screenings are emptied into a storage bin of 10 tons capacity from which they are taken as needed by the line department for filling around poles. The dry sand is conveyed to a hollow tile silo which holds 300 tons. The apparatus can dry 2 tons of wet sand of 15 per cent moisture content per hour.

The contracting firm for the plant was the Fisher-Devore Construction Company of Cincinnati. Architectural and engineering details were directed by Harry Hake, architect, working in collaboration with the mechanical department of the Cincinnati Street Railway. As the company is working under a service-at-cost franchise, all expenditures were approved by the Department of City Transit.

Cars Revamped into Snow Fighting Equipment

FOLLOWING a severe snow on New Year's Day, the Gary Railways, Gary, Ind., immediately remodeled six of its retired passenger cars for snow fighting at a total expenditure of approximately $22,000.

These six cars were equipped with Cummings Car & Coach Company standard snow sweepers and plow mechanisms. Rebuilding of the cars began Jan. 20 under the direction of a crew of men from the Paris, Ill., shops of the Cummings company. Working uninterruptedly for nearly a month in the car shops of the Gary Railways this group converted two of the old double-truck



Snow sweeper mechanism installed on four passenger cars was standard equipment of the Cummings Car & Coach Company

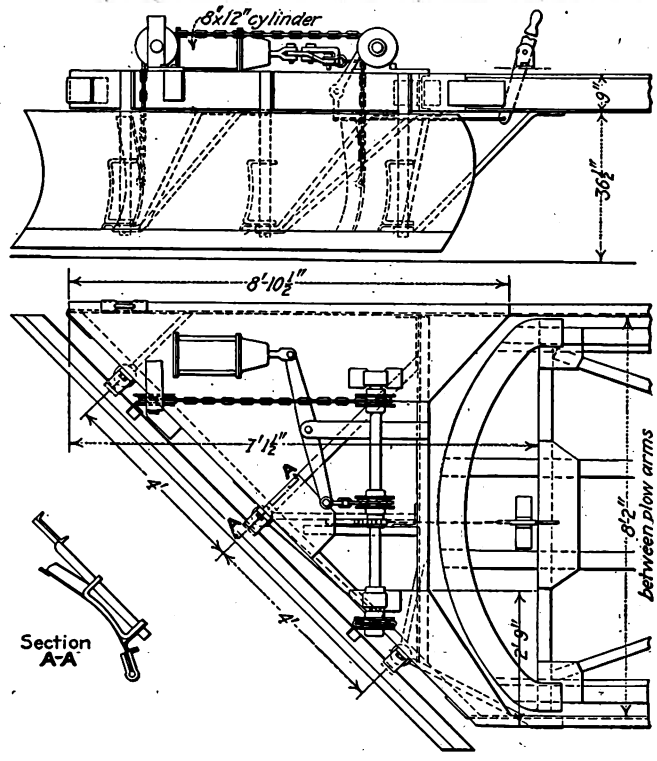
This center entrance car was converted into a shear plow



The shear plows put on two cars are operated by air from inside the car

cars into shear plows capable of a speed of 50 m.p.h., while the remaining four units were remodeled into snow sweepers. The two former cars were so arranged that the plows, located at the ends, may be raised and lowered by air under the control of the operator within the car.

The rotary brooms have individual driving motors with a single controller, the electrical circuits being opened by a specially-wired circuit breaker.

Four of the cars were completed when a severe snow storm struck Gary the night of Feb. 17, and continued unabated for a night and a day. When the storm started the four newly-adapted snow fighting cars were put to work. A fifth was so nearly ready that the construction crew elected to work all through the night of the storm, and this one was in service early the next morning and did its share in clearing the streets. Contrasted to the equipment with which the January storm was fought, the February blizzard found the company with three double-truck sweepers, three single-truck sweepers, and four plows, two being of the vertical, shear type, the other two of the nose type.

A comparison of costs showed that fighting the storm of Feb. 17 required an expenditure of only $1,980 as contrasted with $5,659 for New Year's Day, with the limited facilities then available. In addition to this, the street car receipts were $1,000 greater than those during the previous storm, and the good will of the company was unquestionably enhanced due to the material reduction in interruptions to schedules.

Railway Electrification in Holland

SO FAR the only portion of the Netherlands State Railway system's main line electrically equipped is between Rotterdam and Amsterdam, about 54 miles. For passenger service, most of the trains consist of five cars, of which the first and last only are motor cars. Through trains are hauled by steam locomotives, and the freight service of the line is still given by steam. In addition, a branch line connecting Rotterdam, the Hague and Scheveningen has been changed from single phase to direct current to conform to the main-line equipment.

Power is purchased from existing commercial stations and is converted to 1,500 volts d.c., which is used on the trolley line. The consumption of energy on the lines so far equipped is expected to be about 30,000,000 kw.-hr. annually. This estimate is based upon a traffic of about 5,000 train-miles per day on the main line, and about 2,300 train-miles on the Scheveningen branch during the summer and 2,000 train-miles during the winter. These total about 2,500,000 train-miles annually.

Collection of energy from the overhead system is by two pantographs and there are two overhead wires for each track. This arrangement reduces the current to be collected at each contact. Another novel feature of the overhead is that the supporting poles are not painted but were covered with zinc by the Schoop process. This method was adopted because a considerable part of the line is close to the North Sea, and the danger of rust is great.

Each five-car train on the main line accommodates about 322 seated passengers, with standing room for about 120 more. The motor cars weigh about 60 metric tons and the trailers about 40 metric tons each, so that the weight of a five-car train is about 240 metric tons. This gives a weight per seated passenger of some 1,650 lb. as compared with 2,090 lb. for a five-car steam train with the weight of the locomotive included.

The distance of 54 miles between Rotterdam and Amsterdam, with five stops, is covered in 66 minutes. A train can accelerate to 60 m.p.h. from a full stop in about three minutes. Each motor car is equipped with four 190-hp. motors with electro-pneumatic train control. The control voltage is 240 volts, which is also the voltage used for the electric lighting. The cars are equipped with air brakes and the over-all length of each is about 65 ft.

De luxe equipment of the company consists of five six-wheel, 30-passenger Safeway buses

Bus Service Rearranged in Kansas City

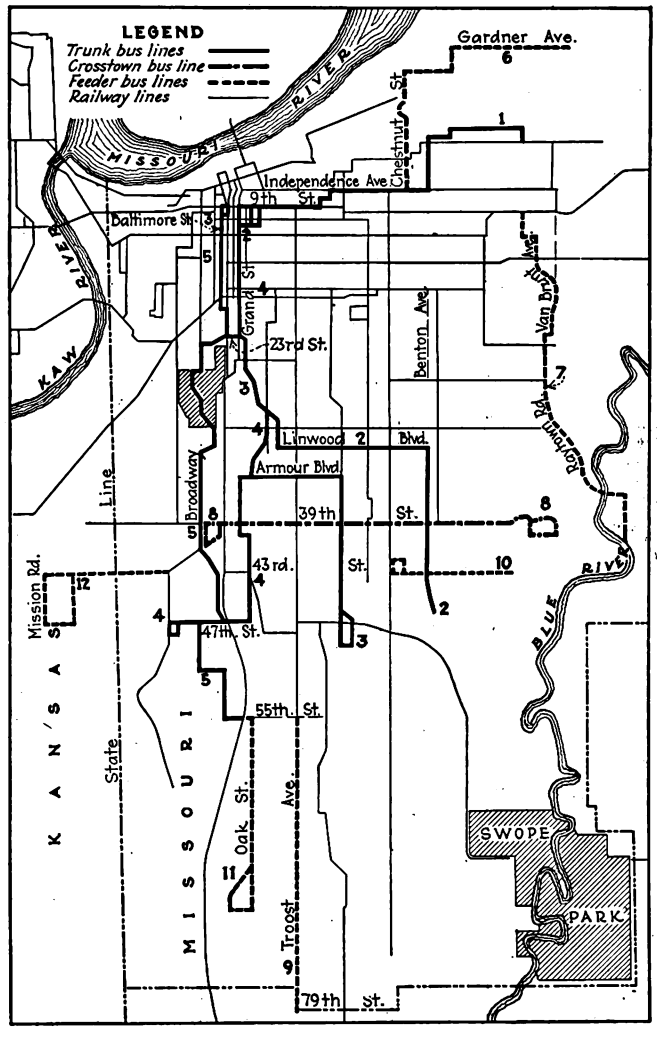
Five trunk lines, one mid-city crosstown line and six feeder lines operating under new bus ordinance. Fare on trunk lines increased to 15 cents, while fare on other lines remains 10 cents

UNDER the ordinance recently passed by the City Council of Kansas City, Mo., a rearrangement of the bus service was put into effect by the Kansas City Public Service Company. The plan, which is to remain in effect for six months ending Nov. 30, allows for approximately 3,000,000 miles a year, an increase of about 350,000 miles over the former arrangement. This increase is principally in feeder service, giving transportation to districts heretofore unreached.

It is believed that the rearrangement of routes will better serve the public convenience, and partially reduce the large operating losses incurred in rendering bus service. Fares on the crosstown and feeder lines will remain 10 cents, as heretofore. Fares on the trunk lines will be 15 cents for one way, an increase of 5 cents.

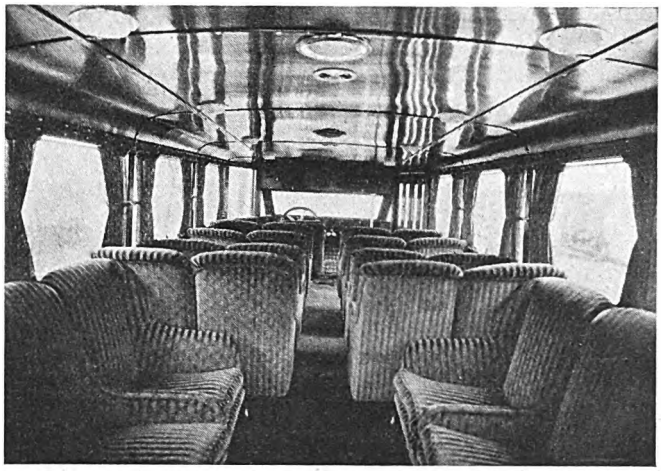
In the accompanying map are shown the present bus routes in the city. There are five trunk lines, one mid-city crosstown line and six feeder lines. Three of the trunk lines were unchanged, while minor changes were made on the other two. The crosstown line operates on 39th Street, and connects with nine street car lines and four bus trunk lines. Two of the six feeder lines are entirely new, while a third was extended considerably.

Free transfers are issued to and from the 39th Street crosstown line and the four bus trunk lines it crosses. Free transfers are also issued for certain intersecting street car lines. Transfers, however, are not issued on street car lines for the bus trunk lines. On the mid-city crosstown line, 3-cent transfers from connecting street



Bus routes of the Kansas City Public Service Company extend over a large area of the city

Digitized by Google



Interior of one of the de luxe buses

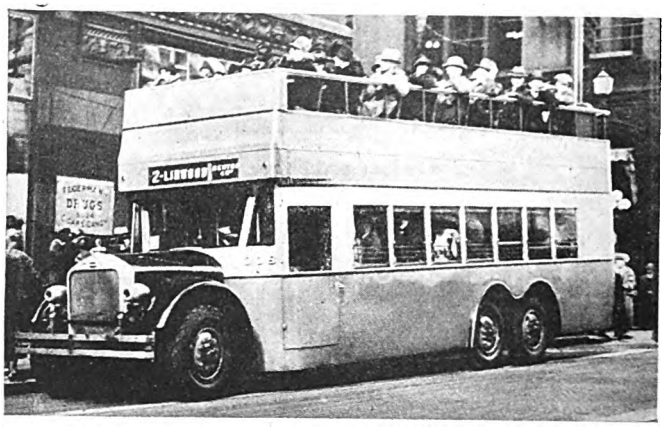
car lines and free transfers from connecting bus trunk lines are accepted, and 5-cent transfers to connecting bus trunk lines are issued. On all the feeder lines, free transfers are issued to connecting street car lines, but a charge of 3 cents is made for a transfer from a street car line to a feeder line.

The hours of service on the trunk lines are from 7 a.m. to 11 p.m. on business days, and from 7:30 a.m. to 11 p.m. on Sundays and holidays. The crosstown line starts at 5:45 a.m. and runs to 11:45 p.m. on business days and from 6:45 a.m. to the same closing hour on Sundays and holidays. On two of the feeder lines service is given only during the rush-hour periods. On the other lines, the buses run throughout the day.

A pamphlet was prepared describing the new routes, the schedule of fares, the transfer privileges and hours of service. Starting the day before the new plan went into effect, 100,000 copies of this pamphlet were distributed to street car and bus riders, to hotel and apartment hotel guests, to hundreds of home owners and to several thousand business men.

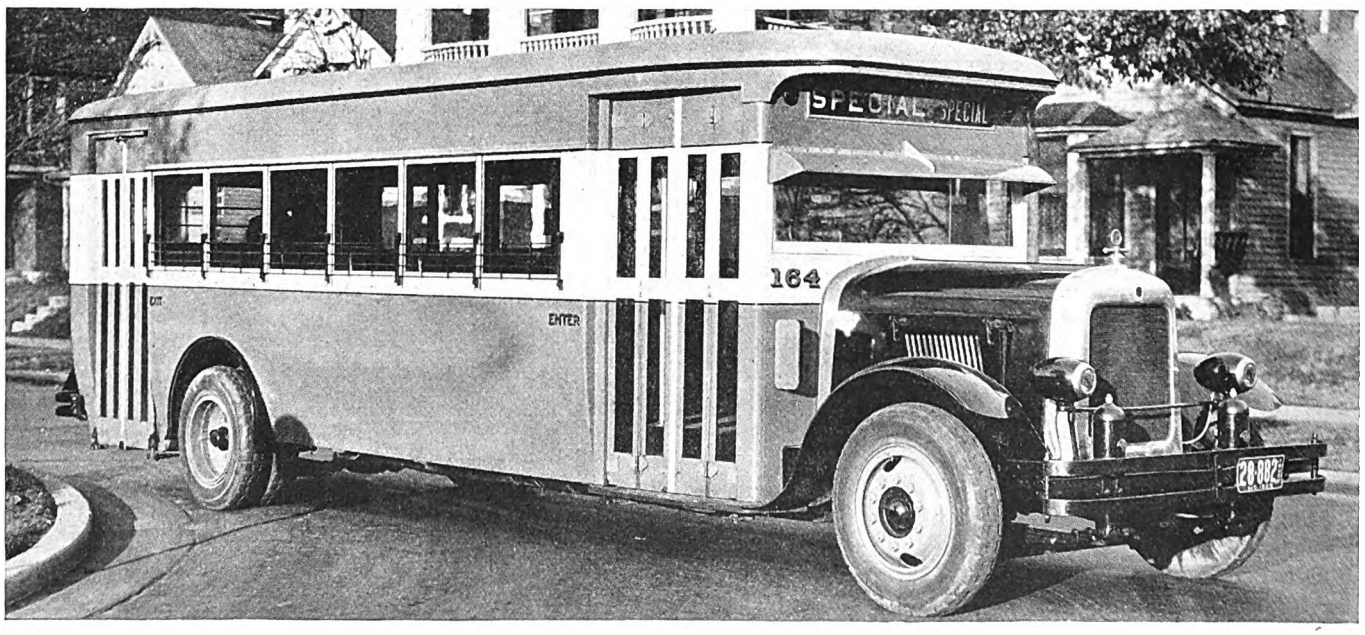
Checks made by the company show that there has been no decrease in patronage as a result of increasing the fare on the trunk lines. Although the double-deck buses did a light business the first few days, this was believed to be caused by disagreeable weather. On the whole, the patronage was practically the same and the patrons indicated that they were willing to pay the 15-cent fare.

The bus system in Kansas City was started in the fall of 1925 to meet a public demand for buses. Service was begun under the terms of an ordinance dated April 7, 1925, and expiring June 7, 1928. The short term was specified because of the uncertainty surrounding bus transportation. It was felt that with experience under actual operating conditions, what was best for the company, the passengers and the city could be determined.



Double-deck buses are used on two of the routes. Eighteen 63-passenger Safeways are in service

On March 30, 1928, the railway submitted to the Council a report with suggestions covering the present operation of buses, and proposed rerouting and rearrangement of the system. The Council gave careful consideration to all figures and suggestions presented and on May 21 granted a new motor coach permit to the company. The new lines and the establishment of a 15-cent fare plan were the two important features of the new bus ordinance.



Twenty-five 30-passenger Yellow coaches, six of which have gas-electric drive, are operated by the Kansas City Public Service Company

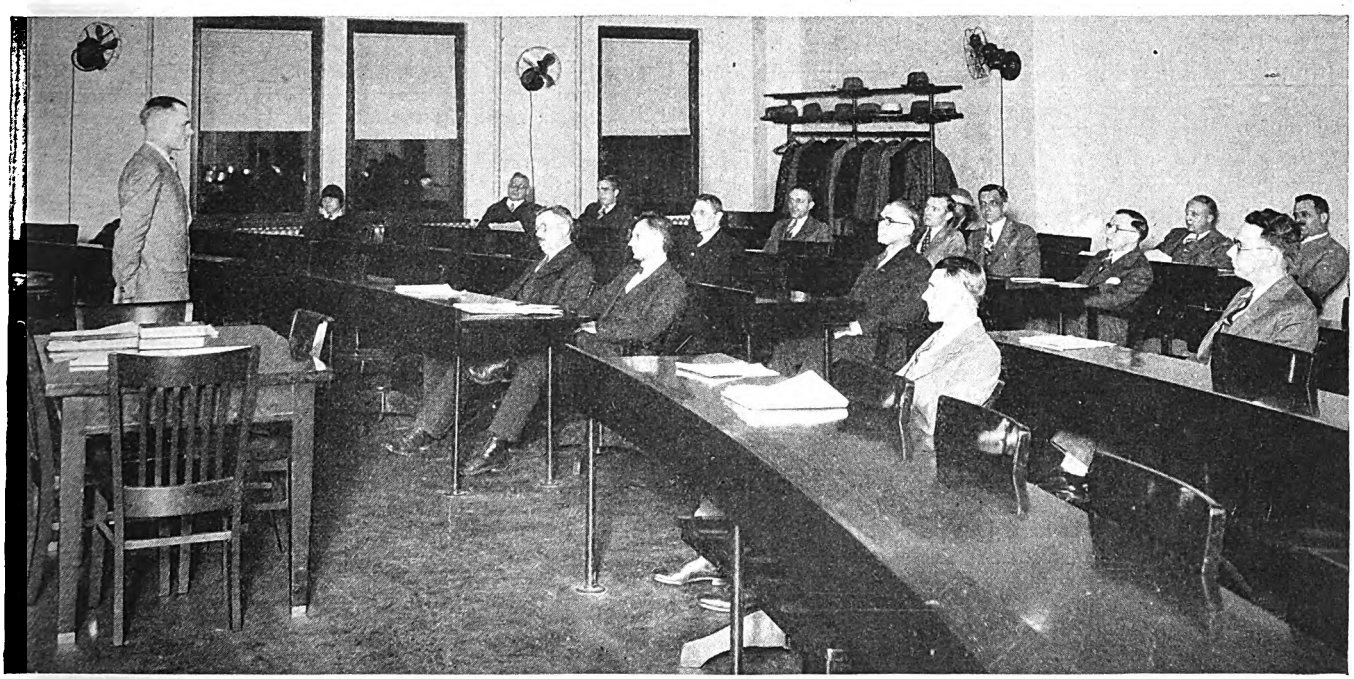
Interesting the Utility Employee in Education

By James L. Lovitt
Director Training and Education Philadelphia Rapid Transit Company, Philadelphia, Pa.

Instruction program of the Philadelphia Rapid Transit Company, planned after studying questionnaires filled in by employees, covers numerous subjects pertaining to the electric railway industry. Enrollment of 4,000 during the first year is evidence of its success



Students taking Public Speaking are not only taught how to speak, but also are given practice in elementary parliamentary procedure and informal debate

"IT WAS in making education common to all, that the destiny of the free republics of America was practically settled," wrote James Russell Lowell. For a people to maintain a political democracy they must be equipped with an education sufficient to understand the "why" and the "how" of things. This inter-relationship of education and self government has its counterpart in an industrial democracy.

Inasmuch as the employees of the Philadelphia Rapid Transit Company are substantial owners of the property, it is logical to expect that they would receive a practical educational program with considerable enthusiasm. Such a program was inaugurated a little more than a year ago by Mitten Management in accordance with its long established policy of providing the employees of the properties under its direction with every opportunity for bettering themselves. The fact that approximately 4,000 enrollments were tallied for courses offered during the first year by the newly instituted training and educational division is evidence of the willingness of the workers to assume the responsibilities which should rightly accompany the ownership of industrial property.

In considering this rather encouraging number participating in the educational program two factors are significant. Firstly, the courses were selected and developed on the basis of a questionnaire distributed among the employees to determine exactly what type of training they considered of value in assisting them in their industrial life. Secondly, the enrollments were entirely voluntary, no pressure of any sort being brought to bear to establish record enrollments.

The danger of having the employees expect immediate promotion upon the successful completion of a course was forestalled by an announcement of a definite policy that the primary intention of the education program was to assist the men to attain the highest standard of performance on their own jobs and that as promotional opportunities occurred those who had proved their worth

Digitized by Google

on their own jobs would be the logical selections for increased responsibilities.

Issue of the questionnaire referred to above was the first thing that the training and educational division did. Five thusand copies were distributed, and the returns, representing a cross-section of employees of all departments, constituted a sound working basis for developing the program. The result was 3,627 requests for courses of various kinds. In addition to a heavy demand for practical and specific company courses, subjects such as English, Spelling, Grammar, Bookkeeping, Accounting, Economics and Elementary Arithmetic were high in the popularity scale. In fact, English led the list by a considerable amount.

It was deemed inadvisable, however, to duplicate the work of existing local agencies which are successfully conducting educational work in these basic subjects. It was therefore decided to encourage the men to enroll in the outside schools for this type of instruction and to establish an educational advisory service to counsel with the members of the organization regarding their educational needs.

The P. R. T. courses are developed entirely by men within the organization who, through their intimate contact with the industry, are able to construct text material which would supply the practical educational needs of the workers. Likewise, the entire personnel of instructors is drawn from the organization, specialists in their particular field with a background of practical accomplishment. The selection of instructors is made very carefully, bearing in mind not only technical qualifications, but also personality, so necessary for successful teaching.

Correspondence Courses Instituted

In an industry such as transportation, requiring continuous operation, a considerable number of those desiring educational courses would necessarily be deprived of the opportunity of attending evening classes due to their hours of employment. This problem was met by instituting home study or correspondence courses. An employee enrolling for a course receives his first lesson in pamphlet form with an examination paper appearing on the last page, perforated at the binding. After studying the assignment, he answers the questions and submits them. His paper is marked, recorded and returned to him corrected, along with the next lesson. The plan provides for individual attention, and letters offering advice and suggesting further reading are sent frequently. Because courses offered deal with subjects specifically developed for the needs of a particular organization, the text material is not of a general character and is not obtainable elsewhere.

The correspondence method, therefore, has an added advantage in that the complete set of lessons of any course, becoming the property of the employee constitutes an excellent reference text. The lesson pamphlets are punched for retention in a standard size loose-leaf binder.

Correspondence courses may be started and completed at the convenience of the employee, but it is interesting to note that the element of procrastination is extremely small, very few allowing more than two weeks to elapse between lessons, and a negligible number dropping courses.

The attendance at the evening classes, which are held from 7:30 to 9:30 p.m. on the property, is another indication of the desire for industrial education. The average attendance for all courses given so far was 68 per cent, while 29 per cent have established 100 per cent attendance records, an outstanding achievement for industrial classes conducted on a voluntary basis.

General Subjects of Entire Electric Railway Industry Offered

The more one can visualize just exactly where his particular work fits into the complete industrial program, the more satisfied and productive he will be. "The Electric Railway Industry" was the first course offered and came as a result of a desire upon the part of the men to become more acquainted with the organization as a whole; to get a broader viewpoint of the workings of the various departments of not only their own company, but of the industry in general. The text was carefully prepared by major officials and embraces the following topics:

"Development of the Street Railway Industry," by W. K. Myers, former president of P.R.T. and now vice-president of Mitten Bank Securities Corporation.

"Transportation and Traffic," by W. J. Beadle, traffic consultant and former manager of transportation.

"Construction and Maintenance-of-Way," by J. H. M. Andrews, an authority on roadway and assistant to the president.

"Maintenance of Equipment," by G. H. Stier, superintendent of rolling stock and buildings, and F. L. Hinman, superintendent of shops.

"Generation and Distribution of Power," by H. G. Werner, in charge of the electrical department.

"The Motorbus," by R. H. Horton, former president of the bus organization and an authority on bus transportation.

"Materials," by W. E. Scott, superintendent of materials and supplies.

"Importance of Employees in Public Utilities," by Dr. A. A. Mitten, executive vice-president Mitten Management.

"The Value of a Public Utility," by C. J. Joyce, a management official and an expert on the legal phases of transportation as well as the valuation of public utility property.

"Claims," by J. J. K. Caskie, general attorney.

"Finance and Accounting," by C. E. Ebert, comptroller Mitten Bank Securities Corporation and an expert on public utility finance.

"Public Relations," by J. M. Shaw, vice-president Mitten Management, responsible for public relations policy on Mitten properties.

The above series was followed by a general review. This course was at first presented weekly at evening lectures, followed by discussion, and was attended by 320 employees. The material was later presented as a correspondence course and was met by an enrollment of 660, which is being augmented daily.

Course Given to Develop Better Leaders

Industry becoming more and more humanized, those qualities which are essential to successful leadership in any field are becoming more and more important to the ambitious industrial worker. The course, "Handling Men," prepared by E. J. Benge, from his wide experience in industrial relations, presents and discusses the principles and accepted practice of conducting human relationships, including the handling of subordinates. It is a practical course intended to develop a better quality of industrial leadership and to develop potential supervisors. The lessons embrace: the Problem of Human Relationships, the Supervisor's Job, Stimulating Subordinates, Control and Discipline, Appeals for Better Work, Force of Habit, Training Insures Careful Work, Self-Development, Difficulties with Subordinates, and Co-operation.

Included with this course also are some self-analysis tests and hints for self-improvement. This material is so arranged that the employee, if he so chooses, can get a

Digitized by Google

A split-engine, other experimental equipment and moving pictures are used in the Gas-Electric Bus Course

fairly accurate picture of his personal assets and liabilities, and in this way can be guided in his own personal development program. Such tests as vocabulary, memory, general information and arithmetic are included and an easy method of comparing his scores with the average is given.

"Handling Men" has proved popular, 55 employees having taken it in the evening sessions and 673 enrolling for the correspondence course.

Principles in Dealing with Public Outlined

The problem of developing good public contacts is an extremely vital one for a public utility. "Public Relations" is a course that covers the broader features of the company's dealings with the public, describing the accepted principles of public utility economics and revealing the importance of the new and highly practical development of the co-ordinated transportation business. J. M. Shaw, vice-president of Mitten Management in charge of public relations, is the author of this course. The lessons embrace successively: Our Transportation System in Its Relation to the Public, the Public Relations Problem, Production and Participation—The Heart of the Industry, Relation of Fares to Service, Monopoly Versus Competition, Informing the Public, the Newspaper as a Public Utility, Complaints and Commendations, Relations with Civic Bodies, Relations with Schools and Churches, Customer Ownership and Its Effect on Public Good Will and Advertising to Sell Transportation.

Like the two courses mentioned previously, this was offered in the classroom first and later in correspondence form, 30 employees taking the first classroom course and 318 to date having enrolled for it in correspondence form.

Fundamentals of Electric Car Taught

A fuller knowledge of the equipment and the best operating methods undoubtedly contributes to the making of better and more interested trainmen. The course, entitled "The A. B. C. of the Electric Car," was designed to acquaint the non-technical men of the organization with the fundamentals of electric railway operation. The topics cover: Motor Analogy of the Electric Car System, What Starts the Car, How the Control Works, Simple Relation of Flow of Current, Some Details of the Car Equipment, Mounting of Motors in Truck of the Car, How the Car is Driven by the Motors, the Motor and Its Windings, Magnetism and Magnetic Lines of Force, the Electro-Magnet, What Makes the Motor Turn, What Makes the Motor Reverse, Electric Circuits on the Car, Open Circuits, Grounds and Short Circuits, Trolley and Third Rail Electric System, Feeder Systems, Rail or Ground Return and Electrolysis, Description of Safety Car Control Equipment and Rules for Operating the Air Brake and Safety Car Control Equipment.

The stenographic courses develop secretaries with a practical knowledge of the city transportation business

Digitized by Google

Three months after its announcement this course had received an enrollment of 451.

The rise of bus transportation and a description of the gas-electric principle are given in the "Gas-Electric Bus" course. It includes a study of the engine, ignition, the generator, control equipment, the motors and chassis of the gas-electric bus. A split-engine is used for demonstration purposes, as well as considerable experimental equipment and moving pictures. Two courses were offered in the evening series, receiving a total enrollment of almost 300 employees. The course will be offered in correspondence form at a later date. Courses designed to assist those engaged in the taxicab branch of the company are being developed and will be offered shortly.

Course Teaches How to Manage Storerooms

So much capital is tied up in the supplies department of a large industry that the storeroom is certainly a place where scientific management can result in considerable economies. The course, "Stores Methods," deals with the functions and detailed operations of the materials and supplies department and is conducted by W. E. Scott, the official in charge of the stores department, and F. H. Tucker and L. A. Bansbach, his assistants. This is a practical course in the study of the methods used on a street railway property. During the course visits to the various storerooms are made. It is given in twenty weekly evening sessions and is attended by 67 employees, most of whom are connected directly or indirectly with the stores department.

Practical problems involving the fundamental principles of mechanical drawing and technical sketching are given in "Blueprint Reading," aimed to develop ability to understand shop drawings and blueprints. It is built around actual problems covering twenty weekly evening sessions, and is attended by 50 men. The course is under the guidance of F. W. Warwick of the engineering department and a former instructor at Drexel Institute.

The problems of practical mathematics as they apply to industrial conditions are treated in the course "Mathematics." The students whose company activities are similar are grouped together and practical problems are assigned for solution under individual instruction. Problems ranging from waybill calculations, change making and elementary shop arithmetic to levers, tackle blocks, power, strength of materials, cutting speeds and the use of the slide rule, are included. Three courses were held in this subject, the first being attended by 29 men and the last two by 40 men. Two mechanical engineers, R. O. Bowlby and L. Farnham, both occupying positions involving the practical use of mathematics, act as instructors.

"Fundamentals of Electricity" is a basic course for a street railway company, covering both theory and practice. Elementary principles of electricity, such as Ohm's Law, series and parallel circuits, power and magnetism are presented without algebra. Numerous problems are assigned for solution outside the classroom and individual instruction is arranged for when needed. This course was attended by twenty men, under the instructorship of H. D. Baker, a graduate electrical engineer.

Stenography Courses Develop Secretaries With Knowledge of Industry

Four classes in stenography were held at various locations throughout the system, the class hours being arranged to meet the convenience of those taking the course. Instruction is given by E. C. Hardy, a former member of the stenographic division, who, through his experience, is able to make it entirely practical and adaptable to the needs of the organization. The success of these courses has formed the nucleus of a complete secretarial course which is under preparation and which is intended to develop secretaries equipped with a practical knowledge of the city transportation business. The total enrollment for the four courses was 75.

Public speaking, a subject which has always proven a popular one in industrial educational programs, has been given to four distinct groups, limited in order that each individual may have frequent opportunity to develop his own abilities as a speaker. Ease of manner, freedom from self-consciousness while standing on the feet and addressing an audience and the ability to "think aloud" are aimed at, rather than oratorical perfection. Practice is given in informal debate and elementary parliamentary procedure. Outside reading of texts on public speaking is recommended and a moderate amount of outside preparation, in advance of class meetings, is required. Subjects of interest to all are selected for discussion, and a formal debate between picked teams representing the classes, at which three company officials act as judges, is held at the termination of the course. This course is taught by E. F. Thayer, publicity manager of the company.

The employees completing the course may become the members of a speakers' bureau to be used in addressing schools, clubs, etc., in connection with safety campaigns and on similar occasions.

Interest in Self-Improvement Stimulated

A unique course, "Opportunities," consisted of six evening talks on the opportunities which exist in the company and how one may prepare himself for them. One or more department heads were present at each session to describe a few of the specific jobs in their departments, outlining plainly their disadvantages as well as their advantages, and the requisites for promotion to these jobs as well as the qualities for success. After the positions and promotional channels were described in detail, anyone present had the privilege of asking specific questions. The course not only had a tendency to clarify the minds of the ambitious but had a decided effect in instilling a greater interest in self-improvement. The attendance at these classes averaged 152.

Through the company policy of encouraging customer-ownership, all of the employees are, from time to time, entrusted with the responsibility of selling the securities of their company to the car-riding public. Not only to equip them to explain intelligently the various issues, but to guide them in their own personal investment program, a course known as "Securities" was developed under the guidance of C. E. Ebert, comptroller of Mitten Bank Securities Corporation.

Informal discussion groups limited to those of supervisory rank only, are held in the various departments and are in most cases attended by almost the entire eligible personnel. The purpose of these groups is to develop a better understanding of the responsibilities of the supervisors and to discuss current supervisory problems. A few typical subjects taken up by the transportation department group include courtesy, discipline, relations between supervisors and trainmen and the best method of cutting cars when there has been a delay. The roadway group discussed such subjects as welding, blueprints and the basic facts of accounting as it affects construction and maintenance. The general offices group interests itself in accounting and financial items, such as

Digitized by Google

budgetary control, the car-rider collections for stock and materials manufactured in the shops.

Library Assists in Educational Work

Reading lists have been prepared by the Library and offered in conjunction with each course. Books and periodicals which have a bearing on the text of the courses are arranged in a convenient sequence and are dispatched in rotation through company mail to those employees enrolled. In addition, a monthly bulletin is issued announcing the new books which have been purchased by the Library and articles appearing in current publications which have a bearing on any of the problems. Through a very convenient method, these as well as the other facilities of the unusually complete library are made available to all employees.

Because of the keen interest in analysis of statistical data, budget forecasts, economic prediction, etc., a series of ten leaflets dealing with the subject have been prepared and are being distributed to a selected list of executives and department heads. They include the following:

Cross-Section Statistics—These Mysterious Variables; Averages and Other Liars; Deviations Differ; When Two Variables Join Hands, and On How Many Cases Was the Conclusion Based?

Time Series—As the Seasons Change; That Business Cycle; Underlying Trends; Analysis of Graphs, and What is an Index Number?

Problems are contained in each leaflet and considerable interest is taken in working them out. With this series, the educational program is complete in that there are features available to all, spanning the organization from the laborer to the executive.

Performance of Trainmen Analyzed in Milwaukee

Ratings of motormen have been worked out so that follow-up instruction can be given intelligently

MOTORMAN selection tests have been used by the Milwaukee Electric Railway & Light Company for more than five years. Proper grading methods have been sought to record accurately the individual trainmen's ability and to determine what future instruction may be needed by him. The problem has been specific classification of performance for rating purposes that would be sufficiently simple in character to eliminate errors of personal opinion or other factors.

Until recently each new motorman in service was carefully followed up as soon as he had completed his training with the special platform instructors. An instructor rode with the motorman, usually for an hour. On a rating sheet he recorded the time of boarding and of leaving the car, and grades for operation, safety, service, and responsibility of the car operator.

The motorman was given a numerical rating ranging from 1 to 5 on each item listed. The values were: 1, excellent; 2, good; 3, average; 4, poor; 5, very poor. The grade card served as a guide to the instructor suggesting items that were to be particularly checked. It was found, however, that there was considerable difference in the estimates of the various graders. Obviously, some instructors were more easily satisfied than others. It became evident that further definition was necessary. Having specified the items to be graded, the next step was to specify the values to be attached the grades.

Present Plan of Rating

According to the revised plan of rating, the terms "excellent," "good," etc., have been dispensed with, and in their place a booklet has been compiled in which each grade of performance is described in detail, "A" stands for perfect performance all the time, "C" for errors of minor nature repeatedly made, and "E" for serious errors repeatedly made. Scoring now depends on two things: (1) Familiarity of the instructors with what constitutes "standard practice"; (2) ability to observe quickly. Personal judgment is reduced to a minimum. Instructors are being trained along the two lines indicated rather than attempting to standardize their conceptions of "excellent" or "poor."

In order to test out the system six instructors were requested to ride with the same motorman at the same time for a period of an hour and to rate him. The motorman knew he was going to be observed, but inasmuch as the rating was designed to check the uniformity of the instructors' gradings the quality of his work played no part in the results.

Several differences resulted in the grades given, which may have been in part because there were so many instructors on the car that some were in a better position for observing than others. Discussing the causes of these differences, it was found that some of the graders gave a motorman a "C" if he slipped just once on any item. Others were inclined to grade "A" unless the motorman showed that the error was habitual. They felt that if, for example, during some 75 starts and stops, there were only, say, two instances of roughness, the greater stress should be laid on the 73 smooth ones. In consequence intermediate grades "B" and "D" have been introduced. Grade "B" refers to making only once, an error of category "C." Grade "D" refers to errors of class "E" made only once. Each error is described in detail in the instruction book which the instructor carries with him as a reference and which also is given to every trainman so that he will know why and how he is being graded.

This method of rating, then, not only serves to define the classifications of performance for the instructors, but it quickly brings to light their grading judgment. Since each "C" or "E" must also be accompanied by the number indicating the rule which has been broken by the motorman, it can readily be seen which of the instructors are the most observant. In this way it is hoped to better the uniformity of grading and its consequent accuracy.

The form of instructor's report now used includes seventeen items, grouped under four heads, as follows: Operation—(1) starts; (2) stops; (3) schedules; (4) fares. Safety—(5) loading and unloading; (6) following up passing vehicles; (7) warning signal; (8) recognizing danger; (9) attention; (10) action in an emergency. Service—(11) watching for passengers; (12) attitude toward passengers; (13) announcements; (14) information. Responsibility—(15) attitude toward job; (16) following instructions; (17) neatness.

If it is necessary, an order for follow-up is issued. This is made on a form with blanks for the man's division, time of entering the service, past record, reason for follow-up, suggestions for special training, and report of the training division.

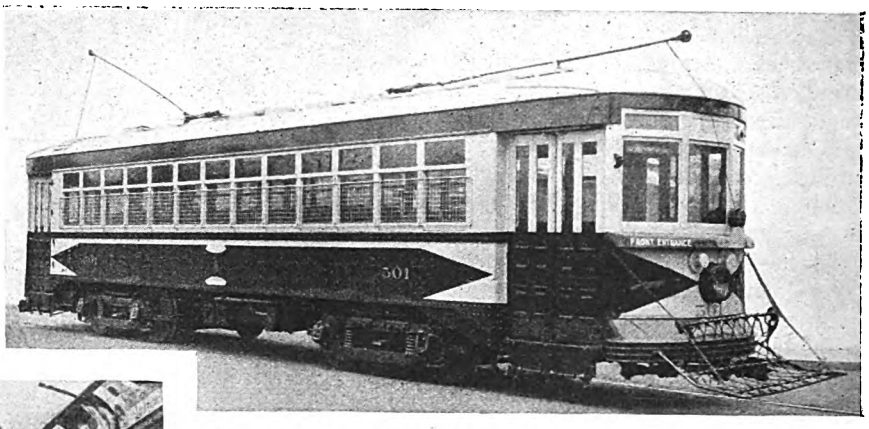
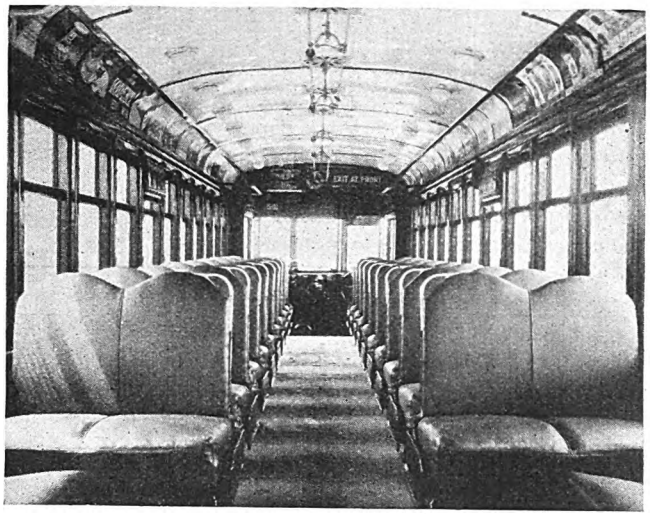
Interurban Cars of Delaware Company Rehabilitated

TWENTY-TWO interurban cars of the Southern Pennsylvania Traction Company, Wilmington, Del., are being remodeled in the company's shops at Wilmington, at an approximate cost of $58,000. The cars are 46 ft. long, have a seating capacity of 52 passengers and are equipped with four GE-247 motors and PC control. The cars are being completed on a schedule of one per week, and are going in service as received.



Car exteriors are finished in cream, orange and green with dark red stripping and an aluminum gray roof. Note the arrow effect on the side panel and the sunburst effect on the front dash



Deep cushioned leather seats were mounted on the old seat frames and new dome fixtures substituted for the old lighting system

The revamped cars have been equipped with the latest type safety devices for one-man operation, including brake interlocks and floodlights over door openings. To assist in fare collection, Ohmer registers of the fourteen-bank type have been installed.

Riding comfort has been enhanced by leather upholstered, semi-divided, deep cushioned seats designed by the railway and manufactured by the J. G. Brill Company. The leather cushions and backs were mounted on the original seat frames. The interior appearance has been improved further by laying Flexolith flooring and replacing the old-style lighting system with up-to-date Ivanhoe dome fixtures, one above each seat. The fixtures use gas-filled lamps with compensating resistances. Hand straps have been discarded and straight grab rails substituted.

The interior of the car is finished in dark mahogany, while the exterior is finished in cream, orange and green with dark red striping, and an aluminum gray roof. The side panel gives an arrow effect in orange against a cream background. On the dash a sunburst effect is carried out. This color scheme is not only attractive but makes the cars much more visible in traffic. To carry out further this dual effect the cars were equipped with dash floodlights for night use.

Not only have new seats, lights and all latest safety devices been installed to add to the safety and comfort of the riding public, but also all truck, motor and control equipment has been rebuilt, eliminating unnecessary noise.

Fewer Delays in Baltimore Caused by Trains

DECREASE in delays caused to cars of the United Railways & Electric Company, Baltimore, Md., by steam train blockades at grade crossings in the city during the first three months of this year was marked. A report compiled by H. Carl Wolf, chief engineer of the Maryland Public Service Commission, from reports made to the commission by the conductors of the United, shows that during the first three months of this year three railroads caused delays totaling 4,159 minutes. During the corresponding period of 1927 the delays totaled 6,769 minutes. Delays caused by the Baltimore & Ohio Railroad decreased from 4,429 minutes in 1927 to 1,694 minutes in 1928.

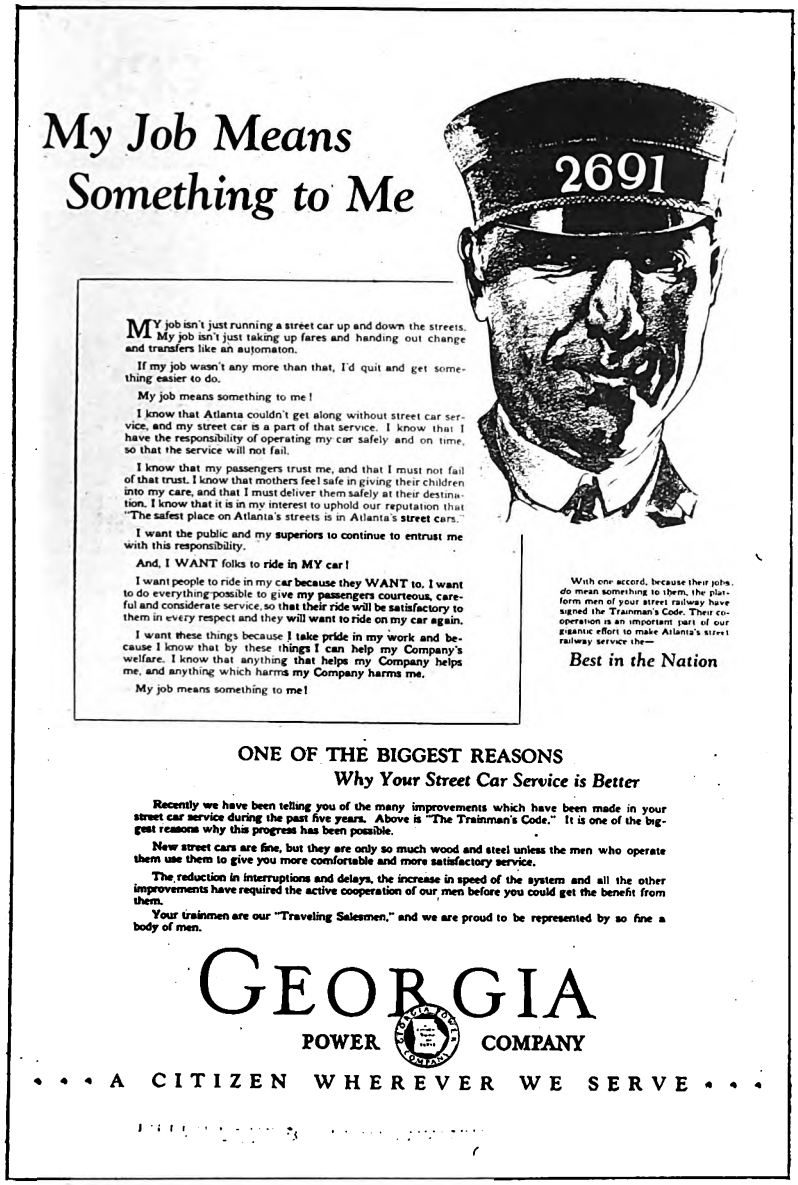
Advertising Prizes Awarded

Georgia Power Company wins first place for electric railways. Portland, Ore., and Twin City companies also honored

IN A nationwide advertising contest conducted among the utilities of the country, the Georgia Power Company, Atlanta, Ga., won first place in the electric transportation division. Second place was won by the Portland Electric Power Company, Portland, Ore., and third place by the Twin City Rapid Transit Company, Minneapolis, Minn. The announcement of these awards was made by Irving M. Tuteur of Chicago, chairman of the better copy committee of the Public Utilities Advertising Association, at the International Advertising Convention in Detroit, at the July 10 session. Presentation of the certificates of award was made by Donald M. Mackie of Jackson, Mich., president of the Public Utilities Advertising Association, acting in co-operation with representatives of the national utility associations.

The accompanying illustrations show the winning advertisements of the electric transportation division and the certificate of award presented jointly by the Public Utilities Association and the American Electric Railway Association.

Digitized by Google



The contest had for its purpose improving the standard of public utility advertising appearing in the 26,000 newspapers in the United States. Newspaper advertisements captured all the winning places. The contest was conducted for advertising in three separate divisions: Electric light and power, gas, electric railway, and bus transportation. The joint co-operation of the National Electric Light Association, American Gas Association, and the American Electric Railway Association was extended in their respective fields of operation. More than 4,000 entries were received from several hundred public utilities. Entries were also received from utility companies operating in Canada, New Zealand and Australia.

All the prize-winning advertisements appear in the new 1928 edition of the "Better Copy Portfolio," together with some 600 other advertisements submitted by public utilities in the United States and Canada. This portfolio, an elaborate book prepared by the association, was presented for its first public showing at the convention and was distributed to utilities in all parts of the country.

First place in the electric division went to the Edison Electric Illuminating Company, Boston, Mass.; second place to the Virginia Electric & Power Company, Richmond, Va.; third place to the New Orleans Public Service, Inc., New Orleans, La. In the gas division first place was awarded to the Equitable Gas Company of Pittsburgh, Pa.; second place to the Union Gas & Electric Company, Cincinnati, Ohio; third place to the Lone Star Gas Company of Dallas, Texas.

The newspaper advertising reproduced was selected for awards in the Public Utilities Advertising Association contest. Below is a facsimile of the certificate presented the Georgia Power Co.

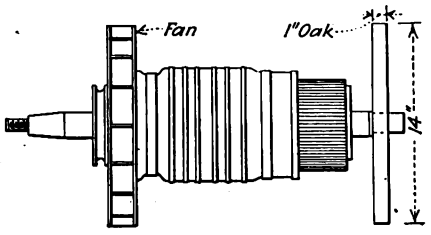
Maintenance Methods and Devices

Round Block Support Protects Commutator

FLOOR space is limited in the shop of the Manhattan & Queens Traction Corporation, Long Island City, N. Y. It is impracticable to erect suitable racks for the storage of repaired and defective armatures. As a result they are stored in an aisle along the wall of the building. This



Wooden disk support for armature keeps commutator off floor

manner of storage resulted in damage to commutators until a method was devised to keep the commutators from coming in contact with the floor. This device is shown in the accompanying sketch. It consists of a piece of round oak bored to fit over the shaft. The outside diameter of this block is the same as that of the armature ventilating fan. Since this idea was adopted no commutators have been damaged.

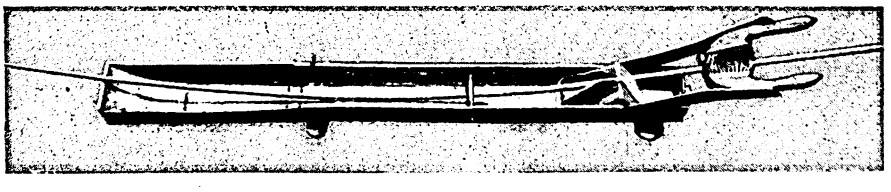
Improved Method of Varnishing Car Beading

By F. A. Comine
Omaha & Council Bluffs Street Railway, Omaha, Neb.

TWO men, using a car beading varnishing-trough designed by D. L. Pattison, master painter of the Omaha & Council Bluffs Street Railway, Omaha, Neb., can turn out the same amount of work in a day as eight men using brushes. There is not only a great saving in labor, but the work is much more satisfactory, the varnish being distributed more evenly over the surface of the beading.

The trough, which is constructed of galvanized iron, is 44 in. long, 4 in. wide and 2½ in. deep, and holds 1¼ gal. of varnish. Two reversible furniture rubbing brushes are fastened in a frame at one end of the trough and are held together by a coil spring 3⅛ in. long. The beading is pulled between these two brushes as it leaves the trough so that all excess varnish is removed and all surfaces of the beading are covered. Twenty inches from the end of the trough and 1 in. from its bottom there is a loose roller that acts as a slide to keep the varnish from splashing when the beading is moving through. A guide near the brushes assists in keeping the beading centered with respect to the two brushes.

Two men use the outfit in varnishing beading. One man pushes the beading into the varnish bath and another pulls it through and lays it on a rack to dry.

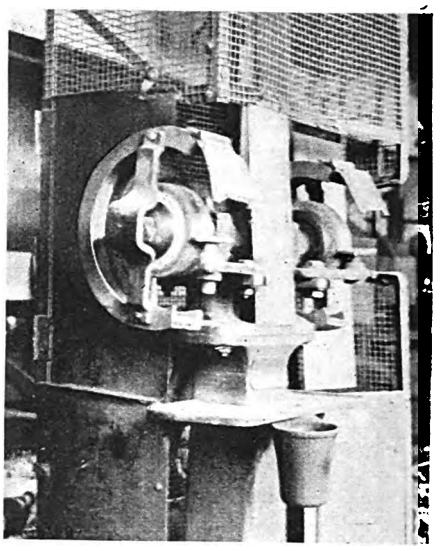


With this varnish trough car beading can be finished in much less time and with more thoroughness

Emery Wheel Guard and Visor

PROTECTION of shop employees from the revolving emery wheel and their eyes from flying particles of emery has been obtained in the shops of the New York & Harlem Railroad, New York City, by development of the guard and transparent visor illustrated. The circular portion of this guard is made of two pieces of 1¼-in. angle riveted to a ⅛x1¼-in. plate and is fastened to the base of the machine by rigid brackets. The emery wheel shaft nut is guarded by a ⅜x2¾-in. bracket shaped so as to prevent entanglement and riveted to the circular guard. The visor is fastened to the top of the circular guard and drops downward so as to stop any flying particles of emery.

The framework is made of brass and is hinged. Both of the vertical edges of this visor are turned over so as to form grooves for the insertion or removal of the transparent medium. Mica is used for this since it was determined that it has a longer life and offers better protection to the operator than other materials. Eye accidents have almost become extinct since this visor has been in service.



Guard and visor protect workmen at emery wheel

Spacing Brush-Holders from Commutator

By John S. Dean
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

IT IS quite generally accepted that some of the side wear of railway motor carbon brushes is due to having the brush-holders spaced too far away from the commutator. Too great spacing also is responsible for some of the chipping and breaking of the carbons caused by unusual vibration. Experience at the Westinghouse factory with new motors, and on the road with repaired and overhauled motors, has resulted in selecting ⅛ in. as the most suitable distance to space the brush-holders from the commutator. On all assembled motors going through railway repair shops this spacing should be checked by means of a wooden wedge with $\frac{1}{16}$-in. steps marked on its side.

When it is necessary to adjust the brush-holder spacing a gage of hard fiber ⅛ in. thick, placed between the carbon box and the commutator, can be used to advantage to insure its proper setting.

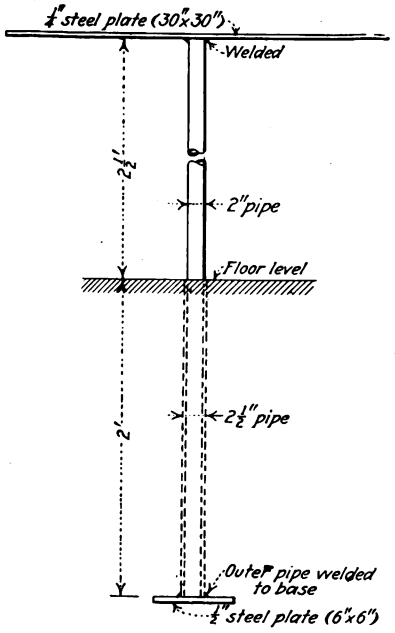
Revolving Work Table

SERVICEABLE revolving work tables have been made in the shops of the Steubenville, East Liverpool & Beaver Valley Traction Company from scrap parts, as shown in the sketch. This particular table was made up from a 30 x 30-in. sheet of ¼-in. sheet steel, 4 ft. 6 in. of 2-in. pipe, 2 ft. of 2½-in. pipe, and a ½-in. steel plate 6 in. square. When assembled by welding, as indicated, a

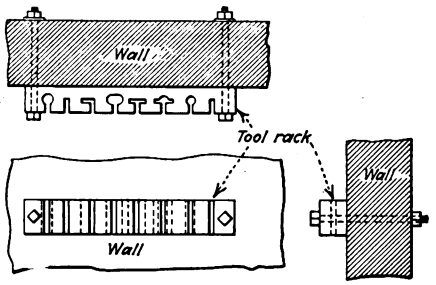


Details of assembly of small work table

handy small revolving table was formed for use in either the blacksmith shop, machine shop, welding shop, or any part of the mechanical department where the heavy pieces of equipment are handled.

Centralization of Tools

CONSIDERABLE time usually is wasted where the tools are not taken care of systematically, and the men find it necessary to look for a tool to perform a certain piece of work. To overcome this waste, tools in the shop of the Jamaica Central Railways, Jamaica, N. Y., are now centralized. This has been accomplished by installing a suitable tool rack near the center of the overhauling department. The rack is designed to accommodate all of the tools needed for a certain overhauling process. It consists of a 2x4-in. beam bolted to the wall. This beam is cut and notched to provide a space for each tool. Each tool is returned to this rack when it is not in use, and at the end of work each day it is a very simple matter for the foreman quickly to make a check and determine which tools are missing and who is responsible.



Tool rack used in shop of Jamaica Central Railways

Adoption of this idea has resulted in a decided improvement in discipline and production.

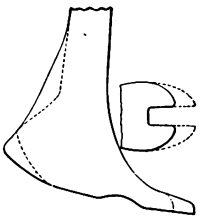
Claw Bar Designed Scientifically

CREWS of the Chicago, North Shore & Milwaukee Railroad track department have developed a 30-lb. claw bar which has served their purposes very well. It was difficult with the prevailing types of claw bars to pull spikes without bending them. With the ordinary type of claw bar, such as indicated by the solid line in the accompanying illustration, the radius of the arc through which the claw passed in withdrawing a track spike was so great that it was next to impossible to prevent severe bending. The excessive depth of the recess or groove in the claw further aggravated the bending by putting most of the pressure in pulling under the far side of the spike head.

In the redesigned bar the depth of the claw was reduced fully one-half and the heel reshaped in such a way as to shorten the arc through which the spike had to be drawn in removing it from the tie. Reduction of the depth of the claw accomplished an almost uniform distribution of pressure under the spike head throughout the entire distance of its travel in being pulled from the tie.

New type of claw bar used on North Shore Line

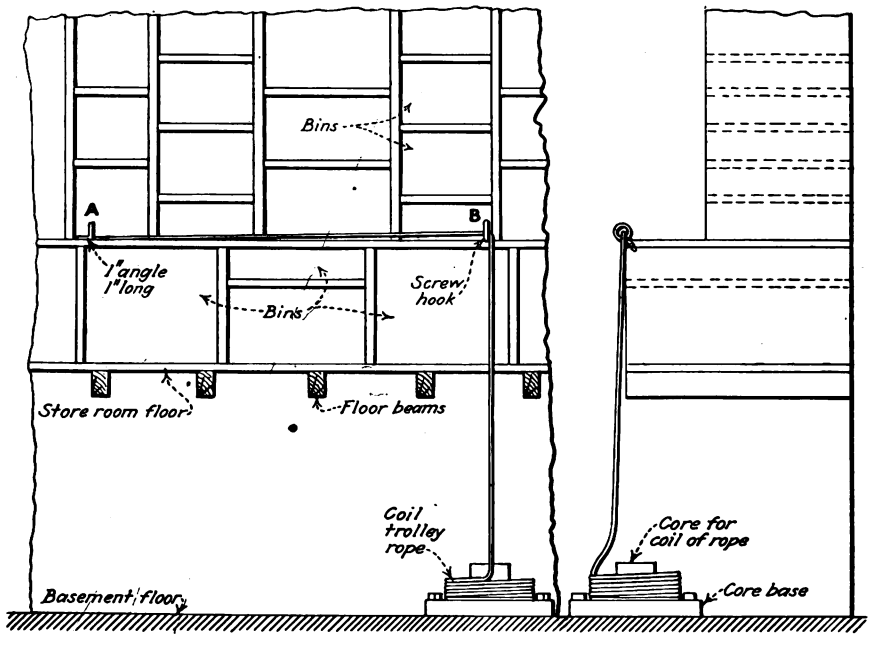
The dotted lines indicate the alterations which were made to the heel of the claw bar to improve its performance. The claw was reduced in depth by one half to eliminate pressure on the far edge of spike head.



So completely successful has been this design that on the North Shore property all of the track crews are being supplied with the revamped claw bars. Work is materially speeded up because less care has to be exercised in pulling the spikes now that the bending has been obviated and because no additional time need be spent in straightening the spikes after their removal.

Handling Trolley Rope in Storeroom

FLOOR space is of prime importance in the shop storeroom of the Richmond Railways, Inc., Staten Island, N. Y. Here all material is arranged conveniently and the storage receptacles are so designed as to occupy a minimum of space. It was found that a coil of trolley rope occupied considerable floor space and



Convenient type of storage rack for trolley rope

Digitized by Google

that delay was occurring in filling orders due to measurement of each piece with a ruler, and to kinking of the rope.

A novel scheme was devised to prevent kinking and at the same time to simplify the method of determining the standard length. The coil of rope is placed over the core of a wooden reel on the basement floor. The end of the rope is taken to the storeroom through a hole in the floor and fastened to the screw-eye at *B*. When an order is received for a standard length the end of the rope is pulled to *A* and then a cut is made at *B*. The small angle at *A* and the eyebolt at *B* are permanently spaced to correspond to a standard length.

This idea has released storeroom floor space for other material and eliminated the delay caused by measuring each length by a ruler or tape line.

New Equipment Available

New Bus Body

SPACIOUSNESS without clumsiness and awkwardness in appearance is given as a feature of the new 240-in. wheelbase, 33-passenger, city pay-enter type bus body introduced by the Bender Body Company,

Interior of the new Bender body

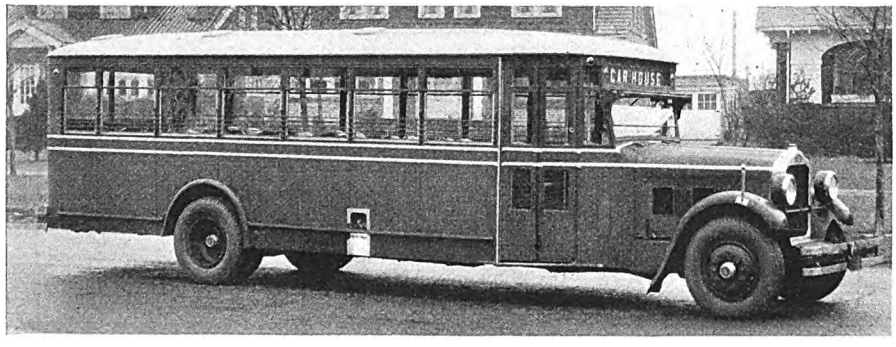
Cleveland, Ohio. Strucural work of the body is of best grade seasoned white ash, primed with oil. All pillars are mortised and tenoned in roof rail and floor sills, and reinforced with steel stays fastened to roof rail, belt rail and floor sill. The front of the body is braced with Bender patent composition metal construction, attached to roof and body framing.

The interior is lined with metal panels and mouldings, except the roof lining, which is of laminated panels. The inside curved corners are moulded for standard-sized advertising cards. The floor covering is of linoleum.

The roof is a separate unit, mortised, tenoned, glued and screwed to body pillars. It is reinforced at the crossbows and body pillars with steel stays. The outer curved corners are covered with sheet metal, and laminated wood panels form the deck. The roof is covered with heavy waterproofed duck, drawn taut and fastened under the gutter drip moulding and painted. The door operating mechanism is of a ball-bearing type, locking the door open or closed. There is an emergency door at the left side rear or center of rear, as specified in accordance with local laws or regulations. This door is usually of the coach type without outside handle, but if on the side has a lever handle on the inside with safety latch. If the emergency door is at the center of the back a three-way lock with lever handle and safety catch is used.

Seats are Bender's own make with skeleton or oval type pedestals. The driver's seat is of the adjustable bucket type. The rear seat extends full width of the body, and accommodates five passengers. Other seat plans are optional. All seat cushions and backs are upholstered in leather. Cushions are made on frames as separate units and may be removed easily. All upholstering is smooth, without pleats. The general equipment includes the fololwing:

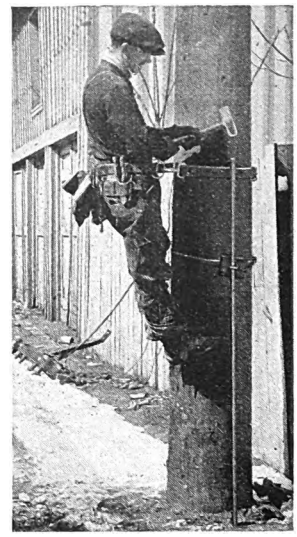
Dome lamps..Closed type, opaque reflectors
Step light.....At entrance
Signal buzzer.....Pull cord type
Windshield wiper .....Automatic
Rear vision mirror.....Standard
Stop signal..In rear panel over license plate
License plate holder in rear.....Standard
Roof marker lights.....Standard
Heater.....Bender floor pipes
Ventilators.....In roof and cowl
Destination sign....Bender type, Hunter illuminated
Spare tire carrier.....At rear or left front
Window guards.....At each window hinge
Rear bumper.....G-G spring type
Hand rods.....Door, driver's seat and roof
Painting.....Bender standard system of Duco, colors optional
Sash....Nickeled brass with safety latches
Windshields..One piece, sloping stationary
Sun visor.....Over windshield



One of the new 240-in. wheelbase Bender bus bodies

Clamp For Driving Ground Rod

WHEN driving a ground rod at a pole, it is sometimes quite difficult for the workman to hold the rod and wield the sledge hammer necessary for driving. This difficulty has been overcome by the linemen on one property, as shown in the accompanying illustration. Here the lineman is driving a $\frac{5}{8}$-in. Copperweld ground rod, which is supported so as to enable him to use both hands. The holding device consists of a wooden block 4x4x2 in., into which a 2-in. staple has been driven. A 4-ft. strap taken from a worn-out belt harness fastens the block with staple to the pole.



Clamp for ground rod so that workman can use both hands

In driving the rod the lineman slips the staple over it and then straps the tackle to the pole. This holds the rod upright and prevents it being driven at an angle.

Association Activities

American Standards Association to Succeed A.E.S.C.

Former body reorganized and enlarged to meet the growing needs of the industry. Procedure will be more flexible

RECONSTRUCTION of the American Engineering Standards Committee to keep pace with the growth of the industrial standardization movement in the United States is now under way, according to an announcement by the committee. The principal features of the reconstruction are the definite federation of national organizations, under the name American Standards Association, in such a way that trade associations interested in standardization may more readily join in the direction of the movement; placing the technical work of approving standards in a standards council; and concentrating administrative and financial responsibility in a board of directors composed of twelve industrial executives.

The reorganization has been unanimously approved by the main committee of the A.E.S.C., and is now being voted upon by the member-bodies. The action of the committee results from more than a year's intensive consideration of the subject by the main committee and rules committee. The latter was enlarged for the purpose to include a representative of each of the nineteen member-bodies desiring representation.

In submitting the plan for the formal approval of the member-bodies, William J. Serrill, chairman of the committee, states:

"The ten years' experience of the committee has brought to light certain fundamental difficulties inherent in the old organization. It is the purpose of the reorganization to eliminate these difficulties, to place the operation of the committee on a sound administrative basis, and to facilitate the financing of the work on an adequate scale."

Among the conditions which led to the reorganization are the growth of the trade association movement, together with the predominating position which the trade association is coming to have in the field of industrial standardization, and the increasingly important direct part which the plant executive is playing in the standardization activities within his plant and in the movement as a whole. Recognition of this latter is reflected in the make-up of the board of directors which will control the general administrative and financial affairs of the association. The industrial executives composing this board will be elected, for three years, on nomination of member-bodies.

"Approval of standards and matters of procedure will be in the hands of a standards council. The council will be composed of not more than three representatives of each of the member-bodies, the councillors also serving for a period of three years.

"The underlying principles of the A.E.S.C. remain unchanged," Mr. Serrill adds. "The basic functions remain completely in the hands of the representatives of the member-bodies. The individual members, whether of the board of directors or of the Standards Council, are appointed or nominated by the member-bodies, which thus remain the fundamental units in the organization.

"The name American Standards Association is being adopted as more accurately descriptive of the reorganized association, and also because of the misunderstandings and misconceptions which have frequently occurred in connection with the words 'engineering' and 'committee.' The scope of the work is, however, being limited to those fields in which engineering methods apply."

The objects of the association, as stated in the new constitution, will be: to provide systematic means by which organizations engaged in industrial standardization work may co-operate in establishing American standards in those fields in which engineering methods apply, thus avoiding duplication of work and the promulgation of conflicting standards; to serve as a clearing house for information on standardization work in the United States and foreign countries; to further the industrial standardization movement as a means of advancing the national economy, and to promote a knowledge of, and the use of, approved American industrial and engineering standards, both in the United States and in foreign countries; and to act as the authoritative channel in international co-operation in standardization work, except in those fields adequately provided for by existing international organizations.

The revised procedure of the committee, which forms a part of the general reorganization, and in which there is much more flexibility than formerly, is already in effect. Under the new procedure, a sectional committee may operate autonomously, reporting directly to the A.E.S.C., or it may act under a sponsor as heretofore. "Proprietary" standards are recognized and may be revised within a single organization on condition that it be shown that the standard is acceptable to the groups concerned—a method particularly applicable to highly specialized fields. In very simple cases, approval is based upon the action of a conference followed by written acceptances of the interested groups.

Southern Equipment Men's Program for Cincinnati Meeting

ANNOUNCEMENT has just been made of the following program for the Cincinnati-Covington meeting of the Electric Railway Association of Equipment Men, Southern Properties, to be held in the Hotel Gibson, Cincinnati, Ohio, July 25-27:

WEDNESDAY, JULY 25

9 A.M.

Registration.

Address of welcome, Clarence O. Sherrill, City Manager, Cincinnati, Ohio.

Address of president.

Reports of committees.

Indorsement of membership applications.

"Evolution of the Master Mechanic," by M. B. Lambert, transportation sales manager Westinghouse Electric & Manufacturing Company, New York, N. Y.

"Co-ordinating Shop Equipment and Man Power," by E. J. Jonas, superintendent of equipment Cincinnati Street Railway, Cincinnati, Ohio.

"Application of Carbon Brushes in Electric Railway Service," by A. Broggini, advertising manager National Carbon Company, Cleveland, Ohio.

2 P.M.

"What Are You Doing to Meet Competition?" by E. P. Waller, manager railway department General Electric Company, Schenectady, N. Y.

"Testing Cars for Performance," by W. A. Keller, Pittsburgh Railways, Pittsburgh, Pa.

"The Articulated Car," by A. T. Clark, superintendent rolling stock and shops United Railways & Electric Company, Baltimore, Md.

"The Bus in Urban Transportation," by V. W. Berry, assistant general manager Virginia Electric & Power Company, Richmond, Va.

"Modernizing Equipment," by R. L. Wommack, superintendent Southern Public Utilities Company, Charlotte, N. C.

"Bus Maintenance," by L. McInerny, master mechanic San Antonio Public Service Company, San Antonio, Tex.

"Centralized Control of Emergency Service," by Joe R. Ong, transportation engineer Cincinnati Street Railway, Cincinnati, Ohio.

The Thursday morning session will open at 9 o'clock and the entire day will be devoted to discussion of questions submitted. These discussions will be continued until 10:30, after which the delegates will inspect the shops of the Cincinnati Street Railway and the Cin-

Digitized by Google

cinnati, Newport & Covington Railway. A banquet will be given in the Hotel Gibson ballroom on Thursday evening at 7:30.

Reducing Insurance Costs

OF INTEREST to electric railway operators was an article entitled "Reducing Insurance Costs," by Charles B. Scott, president Bureau of Safety, Chicago, read before the recent N.E.L.A. convention at Atlantic City.

Mr. Scott pointed out that the average railway executive is reluctant to tackle the problem of reducing insurance expense due to a mistaken notion that the questions involved are too complicated and technical, and the rates, once established, cannot be lowered except by some costly process of construction or alteration of property. While admitting that the subject is by no means an easy one, he proceeds to point out the simple means of reducing costs that are within the understanding of anyone of average intelligence and that can be accomplished with little expense other than attention to details in certain departments of operation. Among the items indicated as being comparatively easy of solution are structural changes in physical properties which have been recommended by qualifying insurance brokers or engineers, a proper classification of payroll where casualty insurance is carried, and an insistance upon the systematic planning of fire prevention work among employees, which is bound to be reflected ultimately in the company's loss experience. Mr. Scott also points out the considerable saving made possible by a systematic study of the principles of co-insurance. A policy of fair dealing with injured employees is quite apt to be reflected in the attitude of all employees in the matter of claims against the company.

Energy Conservation on Electric Railways*

By L. E. Gould
President Economy Electric Devices Company, Chicago, Ill.

ELECTRICAL energy can be conserved by effecting changes in the physical equipment which will reduce the characteristic consumption of a given vehicle in a particular service over a certain route when operated by an average man, by increasing the operating efficiency of the trainmen, and by maintaining the equipment properly.

The characteristic energy consumption in kilowatt-hours per car-mile for an electric railway may often be reduced by a study of the possible redistribution of existing equipment. A few years ago one of the large interurban systems was able without any outlay to effect a substantial energy saving by switching certain car types from local to limited service, and others from limited to local service. Each road has its own situations which offer analogous opportunities.

Another saving possibility is lowering the voltage in the downtown section and raising it in the outlying sections. Still another possibility is the use of control rheostatic losses to furnish part of the car heating. Regenerative braking has been used by electrified railroads in mountainous districts, and some studies have been made in metropolitan districts. Substantial savings have been realized on one high-speed 1,500-volt metropolitan surface and subway system by partially replacing control resistances with heavy reactances.

Car friction offers an opportunity for reduction on most every property. Engineers of the United Railways & Electric Company of Baltimore, have made several bearing friction tests. Knowing the physical characteristics of the car under test, its initial acceleration, and with an accurate measure of the distance, the frictional losses in terms of kilowatt-hours per car-mile, with various bearings and oils, were calculated.

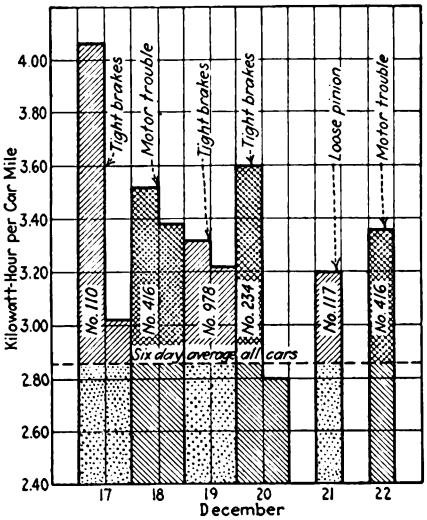

Chart showing the energy consumption of six cars for a period of six days. The plotted figures are helpful in car inspection work

Tests were taken with cars equipped with watt-hour meters and the frictional losses with various bearings and oils were calculated. It was found that a characteristic reduction of more than 0.3 kw.-hr. per car-mile could be obtained by changes in brake adjustment, lubricating period and lubricants.

Other energy saving possibilities are limiting the operation to full series at certain times in certain districts, reducing the number and length of stops, and greasing the track curves.

The amount of saving that can be realized on any property depends on the men who are operating and caring for the cars. Better handling of the controller and brakes by trainmen who have the conservation of energy in mind while operating a car, produces results. Measuring devices for checking the individual trainmen have been installed on more than 200 electric railways. The devices have been helpful even on the road with highly trained men on the cars and in the shops. They provide a simple system of reporting individual performance and are stimuli which maintain the men's interest in more efficient operation. Also, through the records thus obtained, the supervisory force is enabled to learn which men require further coaching.

Maintenance Methods Important

Much of the success in any energy saving campaign depends on the maintenance methods, and the strict observance of chosen practices by the employees in the mechanical department. The watt-hour meter is helpful for the mechanical department for it shows the relative operating efficiency of the equipment.

An example of how road defects increase energy consumption is illustrated by the accompanying chart, which gives the kilowatt-hours per car-mile consumed by five similar cars on six succeeding days of service on a heavily traveled route of a metropolitan property. For test purposes, these cars were operated as nearly as possible by the same crews and every precaution taken to make the results comparable.

On Dec. 17, car 110 after inspection went into service with tight brakes, and used 4.06 kw.-hr. per car-mile for one run. The brakes were then adjusted and another test made. It used only 3.03 kw.-hr. per car-mile on the second run, a saving of 1.03 kw.-hr. for brake adjustment alone. On the eighteenth of the month car 416 showed very high readings and the motorman instructor was asked to operate it. He did so for two hours but could not get its consumption down to the average of the other cars. On inspection, the armature wrapping was found to be carbonized.

Car 234 came from inspection on Dec. 20 with very tight brakes. Adjustment was made and the energy consumption dropped from 3.60 to 2.80 kw.-hr. per car-mile with the same motorman.

Car 117 made the lowest record of the test on the afternoon of Dec. 20. On the afternoon of the next day it could not be operated at normal consumption and an inspection was made. A loose pinion was found to be the cause of the trouble.

The watt-hour meter provides car inspection dials for assisting the mechanical department in its routine inspection work. The dials indicate when a car has performed its predetermined amount of work and is ready to be inspected, oiled or put in the shop. It provides a convenient means for measuring the work done by the parts of a car that need inspection.

Building Good Will*

By B. J. Yungbluth,
President International Railway, Buffalo, N. Y.

IN THE face of the introduction of one-man cars, the inauguration of higher fares and deferred reconstruction of track and paving, it has not been easy to improve International Railway Company public relations. Six years ago typical newspaper headings were "Street car service scored by citizens," or "Mayor renews warfare on I.R.C." Today the same agencies praise I.R.C. men and management for the improvements made.

We have not satisfied everyone, and probably never will, but one of Buffalo's newspapers recently published an editorial congratulating I.R.C. upon its improved service, closing with the sentence, "This paper, that has criticized your service in the past, feels honored in saying a good word in view of your efforts to solve our transit problems." The latest letter received from the Mayor of Buffalo said, "Please accept my thanks for your usual consideration of my request and the prompt action."

Get-Together Meetings Grow

One of the most important factors, our get-together meetings, has been developed by the employees themselves. These meetings began in 1923 in the crews' rooms of the carhouses. A little entertainment was provided and short messages were delivered by a representative of the company. The first meeting was attended by eleven people. Gradually the attendance increased to a few dozens and then to a hundred. The employees began bringing their wives and their children and ultimately their friends. When the attendance exceeded the capacity of the carhouse crews' room, it was necessary to hire a theater. There were 2,000 in attendance at the first meeting in the theater and soon there was standing room only, so that we had to rent one of the largest auditoriums in the city, which has a seating capacity of 3,500. Last week the meeting was attended by 4,500 I.R.C. workers, relatives and friends.

The entertainment at these meetings is provided by I.R.C. musical organizations and by I.R.C. men who stage amateur acts. At no two meetings has the entertainment been the same. The men give their services not only for the rehearsals and for the entertainment, but for the operation of special cars from all points on the system. At the latest meeting more than 544 persons participated in the entertainment. More than half were women and children. The meetings are attended not only by the employees, but every department head and foreman.

The musical organizations were a gradual development for the purpose of promoting the get-together meetings. We started out with a few employees who were able to play a few elementary instruments.

First we built up a concert band which now numbers 58 men, all in full uniform. The men bought their own instruments. Then a kiltie band was started which now numbers fifteen, all in the native costume. Then rapidly there were developed a harmonica band, a girls' ukulele band, a trumpet and drum corps, an orchestra, a male chorus and a junior harmonica band of 86 boys under twelve years of age, sons of I.R.C. employees who made a public appearance and rendered five selections after ten hours of musical instruction by one of our own trainmen. The latest development is a junior orchestra of 44 girls under twelve years of age, daughters of I.R.C. employees, who produce music from bells, triangles, etc.

As a result of the appearance of these musical organizations at our get-together meetings, the company received requests for their appearance generally throughout the city, at church socials, fraternal organization meetings, luncheon clubs and in parades. They have been most enthusiastically received 68 times within the last six months. Last summer for the first time, the musical organizations gave in various parts of the city, free concerts in the parks. There were large audiences at each, but the record was broken at one of the parks on the south side where there had been least sympathy with the company. The audience there numbered 8,000 and was in excess of any audience at any public concert held in the city of Buffalo.

These get-together meetings are supplemented by informal talks on courtesy, neatness, etc., to smaller groups at the carhouses, and by a series of bulletins, illustrated in many cases by the employees themselves. Each emphasized the importance of some particular phase of courteous and efficient operation. So impressed are the men that they have begun to create their own posters on these subjects.

Frequent Talks with Men an Established Policy

The plan of going to the employees frankly, freely and frequently was productive of such splendid results that it naturally set up a basic policy to be followed in telling our story to the public in the interest of a fuller understanding. We established a public relations department at the head of which is a man of ability and long experience, who sits in the councils of the company and there represents the public, so that the company does not fail to consider the public angle in every move that it makes.

This man, then knowing the facts, is able to tell them to the newspapers. These statements are interestingly written and are cheerfully received and readily printed by the newspapers. Sometimes the papers themselves initiate a commendatory story, as for example, an article which appeared in the Buffalo *Evening News* recently, setting up the safety accomplishments of I.R.C. as a mark for the autoist to shoot at. I.R.C. had a 15 per cent reduction in accidents last year, and a 33 per cent reduction so far this year.

Dash signs on the front ends of our cars and ceiling signs inside the cars carry pertinent messages to the public. The company issues an official publication called *Service Talks,* containing company news and expressing the management viewpoint on questions of common interest to community and company.

To keep our fingers on the pulse of public thought regarding transportation, representatives of the company have joined business, civic and social organizations and actively participate in their meetings. We go farther than that. We grasp every opportunity, create them if necessary, to appear on the public platform and tell our story. On some of these occasions the musical organizations perform, assuring the speaker of an audience that is more than usually receptive. In these various ways, we tell our story frankly to the public. We

carefully avoid giving any promises that could not be kept and when promises are given, we are alert to arrange for their prompt execution.

We go to the extent of publicly inviting complaints, and then see that every one is analyzed and answered fully and promptly. In its offer to improve service and consider suggestions, the company said: "If it can be done, we'll do it; if it can't, we'll tell you why." When there is a reasonable opportunity a service representative calls upon the complainant. The usual result is that the person making the complaint is immeasurably pleased that so much attention is paid to his communication.

One of the most important factors contributing to the improved public relations has been the ability of the company to resume track and paving reconstruction. At the invitation of I.R.C., city officials and officers of local business associations participated in neighborhood celebrations when reconstruction work began. When each job was begun, the president of the local business association and the president of the company lifted the first stone. One enterprising merchant decorated the first brick from his street with a huge bow of blue ribbon and featured it in his window display. Maintenance work had been going on from year to year with little comment, but last season to impress the public with the extent of the work, signs were posted at every job undertaken reading, "Drive carefully, I.R.C. repairing tracks and paving." The knowledge that I.R.C. was busy on practically every street in the city was thus conveyed.

Buffalo's climate, as you know, makes snow fighting an expensive undertaking. Formerly the company cleared its track area only, but during the past two years I.R.C. has made improvements in snow-fighting equipment and the company now clears trolley streets from curb to curb at very little increase in cost. The new methods have stimulated a great deal of favorable comment, not only from motorists, but also from car riders, who find their service less subject to delay; and from city officials.

Such work as we have been able to do has been done, not through any spectacular, highly mysterious methods, but through the application of sound common sense to the public relations problem. Of course the public relations department is charged with responsibility for this work, but the results would not have been possible without the wholehearted co-operation of every department.

Advantages of Mercury Arc Rectifiers*

By M. L. de Angelis
Assistant Electrical Engineer Montreal Tramways, Montreal, Quebec, Canada

THERE is certainly no doubt that up to 750 volts, the modern 60-cycle rotary converter is a very efficient and reliable machine. However, even at its best it is a mechanical rectifier, necessitating a rotating armature with the inseparable current collecting devices which need continuous maintenance. Although the rectifier requires two small motors, one for the oil-sealed rotary pump and another for a cooling water pump, it is essentially a static machine and does not have the disadvantages of the moving type of machinery.

There are many other advantages of this type of apparatus, from an operating point of view. The weight of a rectifier, complete with its auxiliaries, is considerably less than that of a synchronous converter of the same rating. No vibration is set up by rectifiers, so that foundations required are simple and their cost is small. Also, because of the lighter weight, lighter hoisting apparatus is needed. By housing the transformers in an out-door compartment adjacent to the rectifier room, the substation building can be made simple and small. Generally speaking, the rectifier substation requires less floor space for the same capacity than does the rotary converter substation.

The rectifier substation emits two noises, the humming caused by the vibration of the transformer stampings and the noise of the small rotary pump for the preliminary vacuum. The rotary pump can be made very quiet by mounting it to prevent the transmission of any vibration to the building. Locating substations exactly where they are required, irrespective of the class of neighborhood, will result in large economies in feeder copper and distribution losses.

Abstract of a paper presented before the Canadian Electric Railway Association, Toronto, June 6-8, 1928.

Less Switching Equipment Needed

In a manual station the high-tension apparatus will be practically the same as for a synchronous converter installation. However, less starting equipment is needed for the rectifier because of the absence of switches or compensation on the low-tension side of the rectifier transformer, which must take care of relatively large currents. For automatic substations the equipment is somewhat simpler for the rectifier.

The ventilation problem for rectifier installations is easily solved and the station roof and sides can be made with relatively few openings for the ventilators or windows. However, the rectifiers require water cooling, which is a continuous expense and not so convenient as natural ventilation.

Reverting to the operating side of the mercury arc rectifier, there are five outstanding advantages:

1. Little attention is required during service due to absence of brushes, large oil-lubricating rings for bearings, flashovers on heavy shorts and field regulation.

2. The wear on the apparatus is almost negligible, and the maintenance charges are much lower than for rotating machines. Because of the little wear, there is a large reduction of dust on the equipment in general.

3. Rectifiers are free from desynchronizing forces and when the supply voltage or frequency undergo large variations, they are not affected therefrom and do not occasion a short circuit in the a.c. circuit as rotating machines do. Under such circumstances the valve action of the mercury vapor arc prevents return of current from the d.c. side and the rectifier simply drops the load.

4. Rectifiers behave in a most satisfactory manner during short circuits on the d.c. lines or very heavy momentary overloads. The only thing that may happen when the feeder breaker does not open sufficiently quickly is an arc-back in the rectifier with the consequence that protective equipment on the d.c. and a.c. circuits immediately disconnect the rectifier from the buses and the latter can be put back again in service just a few seconds afterward.

5. The outstanding electrical characteristic of the mercury arc rectifier is its efficiency, which remains nearly constant at all loads and which is due to the drop in the arc being approximately uniform under all loads and pressure conditions. The commercial efficiency of a unit, including the transformer and auxiliary apparatus, does not remain constant, but falls below $\frac{1}{4}$ load. However, from $\frac{1}{4}$ up to $1\frac{1}{2}$ full load, the over-all efficiency varies between 92 and 94 per cent. The higher efficiencies of the rectifier at low voltage are very interesting for traction work because the machines are not fully loaded during an aggregate of some twelve hours each day and, therefore, the total daily energy losses are lower than if rotary converters were used.

Limitations of the Rectifier

The rectifier has, of course, its limitations. For one thing, it is not possible to adjust the power factor of a rectifier. It varies from 90 to 96 per cent lagging and it is due to two separate causes, the distortion of the current wave which is not purely sinusoidal and the displacement of the fundamental harmonic of this wave relative to the pressure wave. Even in rotary converter substations it is very difficult, if not impossible, to keep the power factor at unity, and it is quite reasonable that it is more often between 95 and 98 per cent lagging than at 100 per cent, due to the transformer reactance. Therefore, this particular limitation is not a practical handicap for the rectifier. There are, however, three disadvantages which are important. These are the necessity of securing pure water for cooling the high vacuum pump, the danger of backfires when anodes get overheated

Digitized by Google

from too long an overload or a poor vacuum, and telephone interference.

Backfires have now been diminished by means of newly-developed devices. They seem, however, to occasion an increase in the arc voltage drop and thus reduce the efficiency by about 1 per cent. Anti-backfiring devices installed on the Montreal Tramways have been very effective. The average interruption due to a backfire is about 40 seconds and does not interfere with the car service. Both the d.c. and a.c. breakers open immediately on the occurrence of an internal flashover, thus clearing the short between anodes. The a.c. breaker recloses shortly afterwards and the rectifier goes back on the d.c. bus without any difficulty whatsoever. As mentioned, the backfires do not annoy the car service, but they do occasion high electromagnetic stresses on the transformer windings, on the high-tension buses and on the cables. If the feeding network is of small or medium capacity, objectionable voltage dips are occasioned thereby, and the power company will complain about them. With reference to dips in the supply voltage, it may be added that the starting of the rectifier unit does not produce such a long and important transient as for a heavy rotating machine. This is because the quantity of electromagnetic energy to be stored in the apparatus is less in the former case and no moving masses have to be accelerated. Hence, the voltage dip is extremely short and its value lower than in the latter case.

Telephone Interference the Most Serious Trouble

To overcome the interference to telephone systems a long experimental research was carried through by engineers of the Bell Telephone Company, the American Telegraph & Telephone Company, the Brown, Boveri Corporation, and the Montreal Tramways. The Bell Telephone Company had received many complaints from patrons near the substations, all claiming that conversation was seriously hampered by a large volume of noise. The studies revealed that electromagnetic induction between the trolley circuits and the telephone cable circuits was the disturbing factor, and noise measurements made with a standard noise meter revealed that the frequencies of the induced currents were a multiple of the product of the alternating-current supply frequency and the number of the rectifier anodes, or 360 cycles.

Many tests were performed to eliminate the noise, and many circuit arrangements were set up during the investigation. Different combinations of resonant shunt filters, connected across the d.c. buses and with an air core series reactor installed in the negative bus between the return feeder and the negative bus, were tried. Finally, proper values of reactance and capacity were found for each of the three resonant circuits to take care of the 360, 720 and 1,080-cycle harmonics which were found to be superimposed on the d.c. circuit. A temporary filter equipment was then installed in the basement of the Verdun substation of the Montreal Tramways, and left in service continuously since April 28, 1927. It has been very successful.

A permanent equipment has now been built and will soon be erected in the substation. It will consist of a .3 millihenry, 6,000-amp. air-core reactor and three shunt filters each composed of a small reactor in series with a suitable capacitor. The series reactor weighs approximately 4,000 lb. and the total equipment will occupy a floor space of 60 sq.ft.

September Meeting of Maryland Utilities Association

PROGRAM arrangements are now being made for the mid-year meeting of the Maryland Utilities Association, which will be held on Sept. 7, 1928, at the Braddock Hotel, Braddock Heights, Md. It is planned to have group meetings in the morning, sightseeing trips, a golf tournament, special entertainment for the ladies in the afternoon, and a dinner in the evening to be followed by dancing. Special efforts are being made to make the meeting attractive for the ladies, in the hope that a large attendance will result.

A.I.E.E. Elects Honorary Members

FIVE distinguished American engineers were elected honorary members of the American Institute of Electrical Engineers at a meeting of its board of directors held during the annual summer convention of the institute in Denver, Col., on June 27. The men thus honored were Thomas A. Edison, John J. Carty, Michael I. Pupin, Ambrose Swasey and Elihu Thomson.

This was the first time in the history of the A.I.E.E. that any Americans have been elected as honorary members. Previously there were a few foreign honorary members, but the number has always been severely restricted. These five men were elected by the unanimous vote of the 26 members of the board of directors.

Mr. Edison and Mr. Thomson are well known to electric railway men. Both of them were pioneers in development of the electric railway, and in the early days contributed greatly to its advancement. General Carty and Dr. Pupin are best known to the telephone field, while Mr. Swasey is a famous manufacturer of precision instruments and mechanism. All of them are outstanding figures in science and engineering, and their inventions are known not only in America but throughout the entire world.

American Association News

Bulletins in Preparation

SPECIAL reports listed below are being prepared by the bureau of information and service of the American Electric Railway Association. They will be available to member companies on request.

Bulletin No. 207—Accident Statistics of Electric Railways—1927—A comparative summary and analysis of accident statistics reported by 167 electric railways for the years 1927 and 1926. Some of the items covered are as follows: Total number of accidents, number of accidents involving motor vehicles, number of car collisions, number of persons injured, number of fatalities, total cost of claims, ratio of total cost to gross earnings, expenses of the claims department, number of car-miles run and number of passengers carried per accident, details of claims department expenses, etc.

Bulletin No. 208—Accident Statistics of Motor Bus Lines Operated by Electric Railways.—This bulletin gives a comparative summary and analysis of the accidents reported in 1927 and 1926 of seventy-three bus companies operated or controlled by electric railways. Substantially the same information as is given for the railway lines in Bulletin No. 148 is given for the bus lines in this bulletin.

Bulletin No. 209—Comparison of Electric Railway Operating Conditions, Operating Expenses and Results of Operation on Various Unit Bases—Part II., Interurban Lines.—A tabulation of data for interurban lines similar to that given last month in Bulletin No. 203 for the city lines. The data includes the average speed, number of revenue passengers carried per car-mile, per mile of track, per car operated, etc., the operating revenue, operating income and net income per mile of track, cost of maintaining plant and equipment per car-mile and per unit of property maintained, and operating costs on various unit bases of comparison.

Bulletin No. 210—Trend of Material Prices.—A new edition of the Association's regular bulletin on relative cost of materials, bringing down to date the trend of prices of materials used by electric railways, based on data contributed by manufacturers of such material.

The following supplements also have been prepared, bringing the information they cover down to date:

Supplement No. 23 to City and Interurban Fare Bulletins.

Supplement No. 9 to Bulletins Nos. 163 and 164: *Electric Railway Fares.*

Supplement No. 4 to Bulletin No. 188: *Wages of Trainmen.*

Supplement No. 4 to Bulletin No. 189: *Wages of Bus Men.*

Cost of Living Studies (Bulletin No. 211).

News of the Industry

New Franchise Talk in Akron

Discussion is expected to begin soon on the terms of the new contract under which the Northern Ohio Power & Light Company will be permitted to operate in Akron in the future. So that they may be better informed on railway questions the Mayor of Akron and the service director of that city have been enquiring into the operation of the railway systems in other cities, and studying the terms of some of the so-called model franchises. Among the cities they have visited is Cincinnati, which is believed to be more nearly a counterpart of Akron in its physical aspects than any other city in the Central West.

The four-year term under which the company is now operating its transportation lines in Akron expires on Dec. 1. That grant was purposely drawn for a short period so that experience under new terms of operation might be definitely recorded as a guide to a future grant of longer duration. This grant, passed by the voters of Akron by 28,682 to 24,872, provided for a 7-cent cash fare, four tickets for 25 cents, or seventeen tickets for $1. Express bus service is provided at a 10-cent fare.

The franchise that is now soon to expire took the place of the temporary contract made on Feb. 27, 1924, following a period of 27 days, when the city attempted the famous motorization scheme. The old 25-year franchise period expired on Feb. 1, 1924, and the city sought to require the company to continue operation for a period of three to six months at the old 5-cent rate of fare. The controversy in Akron at that time was long drawn out. The steps that led to operation under the terms soon to expire were all reviewed in ELECTRIC RAILWAY JOURNAL at the time.

Utilities Want Judgment Withheld Until Inquiry Is Ended

The joint committee of the National Utility Associations has made every effort to co-operate with the Federal Trade Commission in its investigation of public utilities but final judgment as to the propriety and value of the activities disclosed cannot rest securely on fragmentary portions of the record, the counsel for the joint committee. So declared Josiah T. Newcomb, for the utilities, in a statement made to the commission on July 6.

Publicity given to isolated and scattered portions of the record has resulted in misleading impressions regarding the activities of the industry, the statement declared. The utilities will await the conclusion of the branch of the investigation under way at present before asking the opportunity to present evidence to offset these "misleading impressions" or to introduce affirmative evidence showing the nature and extent of the influences hostile to the utilities which it seemed necessary to combat, according to the statement.

It says that it agrees that material furnished to schools should be free from prejudice and bias, but that it believes that those who are in a position to furnish "technical and economic" information to teachers, are under obligation to do so. Advocates of nationalization of industry and of placing the government in competition with public utilities industries, have extended their influences into schools and colleges, the committee charges. It refers specifically to the League for Industrial Democracy the Public Ownership League, the National Popular Government League, and the People's Legislative Service, and refers personally to Gifford Pinchot and Senator Norris of Nebraska.

Following the hearing on July 6, the commission adjourned "subject to call some time after Sept. 1," with provision for emergency hearings before that time.

Fare of Casual Rider Advanced

Galveston company authorized to charge 10-cent cash fare with four tickets for 30 cents and 25-cent weekly card

AN ORDINANCE was adopted in Galveston, Tex., on June 18, which prescribes the following fares on the railway lines of the Galveston Electric Company:

Adult ride, 10 cents, or four tokens for 30 cents, or a weekly ticket costing 25 cents, which entitles the bearer to ride for 5-cent fare whenever the weekly card is presented.

Half fare, 5 cents, or seven tokens for 25 cents.

Prior to that date the fare was 6 cents for an adult ride and 3 cents for half fare, with the usual transfer privileges. In other words, the new arrangement places the burden upon the infrequent rider. The regular rider has had his fare increased very slightly. On June 25 the company reported riders were responding favorably.

On Nov. 17, 1927, a pamphlet was distributed to the public which set forth the company's story, beginning with June 30, when it presented to the Mayor and commissioners a statement showing what had been accomplished, and ending with a financial statement showing a deficit of 43,000 for the year ended Sept. 30, 1927. In seeking an adjustment the company said it was not its purpose to secure a rate which would produce any more revenue than was necessary for the company to put its finances in condition to maintain proper service, and to continue as a factor in the development of the city.

The difficulties under which the city's transportation service has been operated and the reasons for the losses sustained were made plain in the company's statement by the use of a table, showing that on Dec. 31, 1920, the number of automobiles registered in Galveston County was 4,315, and the number of revenue passengers carried on the Galveston car lines in 1920 was 11,290,030. In 1927 (ten months) the number of automobiles had increased to 12,519 and the number of revenue passengers carried on the Galveston lines had fallen off to 7,344,833. The company stated also that during 1928 it was facing expenditures of from $80,000 to $100,000 for additional paved track construction, in order to cooperate in the city's street improvement program. Another factor contributing to the present unfavorable showing of the railway, it pointed out, was the general increase in prices and wages which had taken place in the past ten years. In Galveston wage rates had been practically doubled, and other costs had increased in proportion. In the face of all this the company had spent approximately $65,000 for new cars of the most modern design.

The present financial showing of the transportation department precluded the finding of investors to put additional capital into this branch of the business. As a proof of this the company offered as evidence the twelve months' statement for the period ended July 31, 1927:

Revenues for fares collected and all miscellaneous sources of revenue	$546,305
Operating expenses representing the every-day cost of operating the service	365,216
Balance	$181,089
Taxes	36,455
Balance	$144,634
Depreciation	70,829
Net earnings left to pay interest on $2,170,718 money invested	$73,805
Amount necessary to pay 8 per cent on cash investment	173,657
The deficit by which the earnings failed to equal 8 per cent	$99,852
Cash investment of $2,170,718 upon which net earnings equal only, per cent	3.40

Having summarized the difficulties the company presented its plan for a fare adjustment.

Injunction Proceedings in Chicago

Attorneys for the Chicago Rapid Transit Company filed a petition with the Federal District Court on July 5 seeking a temporary injunction to restrain the city of Chicago and the Illinois Commerce Commission from preventing an increase of 20 per cent in elevated fares. The action is based on the recent order of the commission which denied the application of the company for the cancellation of the three-for-25 cents ticket rate and weekly pass and the adoption of a flat 10-cent fare.

The bill asks a restraining order to "prevent immediate and irreparable injury, loss and damage to the plaintiff," charging that instead of an 8 per cent return on its valuation, to which the company is legally entitled, earnings under the present rates amount to less than a 2 per cent return. The rates which the company seeks to establish would yield a return of about 4.85 per cent. With operating losses totaling several thousand dollars a day the rates now in force, it is claimed, are confiscatory.

After giving a description of the companies' properties, the petition cites the fact that the Commerce Commission agreed to a valuation of not less than $92,558,000. In its decision of June 28 denying the company's application, the commission declared that "while it is unquestionably true that the company is not receiving the full return on its investment which the courts have decided is a reasonable return," the company was building up its business under the present rates and contended that a higher fare would possibly result in decreased riding. Aside from its contention that the valuation claimed by the company was too high and that a new valuation would be necessary before granting a fare increase, the city presented very little evidence to oppose the application.

Fare Revision in St. Petersburg

The Municipal Railways of St. Petersburg, Fla., have received permission from the City Commission to revise and simplify the fares of the trolley and bus routes in line with recommendations submitted by R. E. Ludwig, director of public utilities, as follows:

The 10-cent cash fare is made standard on the cars in line with the 10-cent charge applied to the bus routes when the latter were installed July 1, 1926.

The 6½-cent (sixteen for $1) trolley token rate will be changed to 7¼ cents (seven for 50 cents), but the tokens will hereafter be acceptable for bus rides as well.

The $1 weekly pass put into effect on Nov. 5, 1927, heretofore available only on the trolley routes, will also be good on the bus routes. This will eliminate the $1.50 car-bus pass.

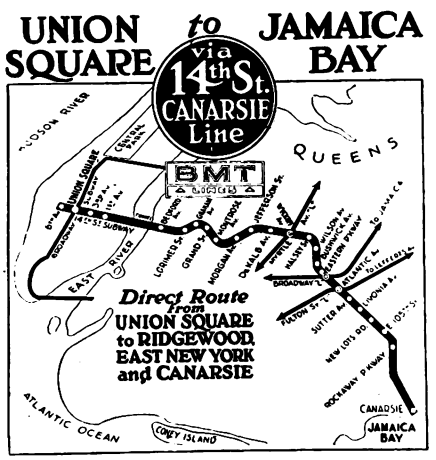
Heretofore, the only transfer granted was to the trolley route serving the municipal pier. The new schedule of fares grants universal transfers.

It is expected that the new rates will go into effect on or about Aug. 1.

Another New York Subway Line Opened

The opening of the Fourteenth Street-Canarsie line of the B.M.T. system on July 14, 1928, marked the end of more than fifteen years' anticipation by the residents of Ridgewood, East New York, Brownsville and Canarsie of direct rapid transit service between Union Square, Manhattan, and Jamaica Bay.

The Fourteenth Street-Canarsie line is part of the rapid transit system provided for in the dual subway contracts



Route expected to relieve congestion

of March 19, 1913. The city of New York in Contract No. 4, of March 19, 1913, agreed to construct a rapid transit route from Sixth Avenue and Fourteenth Street, Manhattan, to East New York where it would be connected with the existing "L" lines at that point. This route was intended to provide direct rapid transit service between the industrial district centering on Union Square, Manhattan, and the densely populated sections of Ridgewood, East New York and Brownsville. The lack of the completed Fourteenth Street line has been the cause for years past of the extreme congestion of transfer traffic in rush hours at Canal Street, Manhattan.

The Fourteenth Street-Canarsie line originally was planned as a subway from Fourteenth Street and Sixth Avenue, Manhattan, to Bushwick and Johnson Avenues, Brooklyn, and as an "L" from the latter point to East New York where it would connect with the existing "L" structures. Contracts for the construction of the subway section of the line were let and the contractor undertook to complete this section by June, 1918. Because of financial difficulties and war conditions, the construction of the subway section was delayed and it was not completed until 1924. Operation in the subway portion of the line was begun on June 30, 1924, and service between Sixth Avenue, Manhattan, and Montrose Avenue, Brooklyn, has been maintained since then.

Differences first as to the route of the eastern half of the line and finally as to whether the eastern half should be an "L" or a subway delayed the letting of contracts for this section. The B.M.T. announced in December, 1923, shortly after its organization, that it would agree to a modification of Contract No. 4, so that this eastern section might be constructed as a subway.

Objects to Condemning P.R.T. Underliers

In his annual report to the City Council, of Philadelphia, Pa., Comptroller Hadley said that the purchase of the underliers of the Philadelphia Rapid Transit Company by the city was not feasible from an economic standpoint and also that it could not be financed out of city loan funds. According to the Comptroller condemnation of the underliers by the city would not constitute a permanent improvement, and therefore, he would decline to certify to the use of loan funds for that purpose. Subsequently it was made plain that Mayor Mackey would instruct City Solicitor Ashton to proceed with the condemnation of the underliers. If the project is sanctioned and Mr. Hadley still proves recalcitrant, the Administration will seek to compel his certification of the required funds by appeal to the courts.

The Public Service Commission already has held one hearing on the city's petition to condemn the underliers' holdings and another session is scheduled for July 16. The Mackey Administration, if a fair valuation is defined by the commission, is planning to exchange city bonds for the stocks and bonds of the underliers, with the expectation of saving $4,500,000 a year by substituting itself as lessor to the P. R. T. and collecting the approximately $9,000,000 a year which the transit company pays the underliers in rental.

The Comptroller says:

It is evident that the value of the physical improvements of the underlying companies is very small, and that the principal things intended to be purchased are the franchises, which certainly are not permanent improvements.

He then pointed out that the city charter permitted the city to borrow money only for permanent improvements and that improvements of a temporary kind have to be certified by the city comptroller to be capital expenditures as distinguished from current expenses.

On July 7 Mayor Mackay said:

I want to make my position plain on the proposal to condemn the underliers. If the program of acquisition upon which we have started cannot be carried out within four weeks so that the proposal can be submitted to the voters at a referendum in November, I am definitely through with it.

With possible litigation to be anticipated, I am not going to commit myself to a lengthy proceeding for the consummation of our plan. If the project is going to be dragged interminably through the courts, we should find out at once how we stand.

Pipes, Kites and Popcorn at Cleveland Picnic

Candy kiss scrambles, grab races, bean bag relays, kangaroo balloon races, Jiggs and Maggie derby, egg throwing, chef boxing, and tug-of-war featured the first annual picnic of the Cleveland Railway held at Euclid Beach Park on June 29. Approximately 10,000 employees and members of their families participated in about 23 events on the program, played baseball, danced and listened to band concerts.

Post cards announcing the picnic and mailed to the home of each employee suggested packing up the basket, bringing the family, and having a wonderful time. Arrangements for this picnic, the first gathering of its kind on the Cleveland properties, were carried out by the general committee of the retirement and benefit plan in accordance with one of the regulations which stated: "A further object of the plan shall be the introduction and development of such projects for mutual good as the advisory committee may, from time to time, deem advisable."

It would appear that "mutual good" was derived. This viewpoint was shared particularly by the largest family on the grounds which, because of its numbers, was awarded the prize of one large ham. Other conquerors went home with perfume, knives, cigars, handkerchiefs and garters.

Ten days later, on July 9, the company gave a banquet at the Hotel Statler to its 90 former employees who are now on the pension roll. Besides being an expression of appreciation for the services of the pensioners, the banquet also marked the first anniversary of the starting of the pension and retirement plan. The pensioners represented a total of about 4,000 years of work for the company. The oldest in point of service was Henry H. Lutzy, 79, who worked for the company 60 years. F. N. Keldorf, 81, was the oldest guest, with 50 years of service to his credit.

Joseph H. Alexander, president of the Cleveland Railway, presented the guests with gold medals which, besides being ornamental, will entitle the holders to ride without charge on the company's lines.

Seven Cents Authorized in Ottawa

The board of railway commissioners has rejected the plea of the Ottawa Electric Railway, Ottawa, Ont., Canada, for an 8-cent fare but a majority decision of the board finds a 7-cent fare warranted. The majority decision is concurred in by Commissioners McKeown, McLean and Vien. The basic cash fare allowed is 7 cents for adults and 5 cents for children. Ticket fares are four for 25 cents for adults and seven for 25 cents for children. Tickets for school children under the age of fourteen are to be fourteen for 50 cents. The present 10-cent cash fare between midnight and 6 a.m. is unchanged. Increased fares as allowed average 6.24 cents per passenger compared with an average of 4.89 cents per passenger in the five-year period ending 1927.

The suggestion for a weekly pass is recognized as having advantages, but for the reasons put forward by R. M. Feustel, expert engaged by the city, the adoption of this system is left optional with the railway.

Agreement Continues in Toledo

A continuance of the wage and working agreement between electric railway employees and the Community Traction Company, Toledo, Ohio, has been decided upon with few changes. Last year's agreement expired on June 1, 1928. The basic wage rate remains 50 cents for the first three months; 52 cents for the next nine months and 55 cents thereafter, with an extra 5 cents for one-man or motor coach operation. Overtime is 75 cents an hour for two-man operators and 80 cents an hour for one-man operators. Overtime applies on all time more than ten hours a day or after completion of any run.

The men had asked for two weeks' vacation with pay, but waived the demand in the hope that other concessions might be gained with complete settlement of the railway problem.

Six Cents for Year on Queens Road

Permission to continue charging a 6-cent fare for another year was given the New York & Queens County Railway at the meeting of the New York Transit Commission on July 5. Application to extend the 6-cent fare order on the lines operating out of Long Island City, originally granted in June, 1924, was made by General Lincoln C. Andrews, receiver of the company.

Public Hearing on Omaha Grant

The liberal and friendly attitude of the new officials of the Omaha & Council Bluffs Street Railway, Omaha, Neb., appears to have almost completely dissipated the hostility which resulted, two years ago, in the voters denying the company a renewal of its franchise. Proof of this was furnished at the recent public meeting, where opponents of the proposed new franchise were invited to present their objections to the City Council before the grant is agreed upon as to the form in which it will be submitted. Only a few citizens appeared, and most of them commended the franchise as fair to both the city and the company. The only critics were those who urged that mail carriers in uniform be transported free, a provision President Shannahan objects is unfair since part of the expense of the rides of the mail carriers is from government expense money. At the last franchise election Councilman Daniel Butler led the opposition, but he is out of the Council and, following his defeat for Governor, out of politics.

Fare Increase Sought in Lynchburg

The Lynchburg Traction & Light Company, Lynchburg, Va., has filed notice with the City Council that on July 25 it will petition the State Corporation Commission for an increase of fare from 5 to 7 cents, with four tokens for 25 cents. The company also asked relief from franchise agreements to require the company to pave within the street car track area. The Council has decided to oppose the request for an increase in fare only if the commission finds the property valuation too large. The request for relief from franchise obligations has been referred to the city manager.

Franchise Not Required Where Commission Permit Is Held

Local transportation companies operating in Illinois cities and holding a certificate from the Illinois Commerce Commission are not required to obtain a franchise from the city. The Supreme Court of Illinois so ruled in two findings handed down at Springfield on June 23.

The two cases in which this question was at issue involved the right of the city of Chicago to compel the Chicago, North Shore & Milwaukee Railroad and the Chicago Motor Coach Company, respectively, to obtain local franchises for the operation of their cars and buses. Both cases were won by the city in the Circuit Court of Cook County (Chicago) but were carried to the higher court by the companies when permission to appeal was granted on the ground that a Supreme Court ruling was needed on a question of such general interest.

In reversing and remanding the decision of the Circuit Court, the Supreme Court held that any power that the city might have had over the operation of North Shore Line passenger and merchandise dispatch trains over the tracks of the Chicago Rapid Transit Lines within the city limits was abrogated with the passage of the Illinois Commerce Commission Act. It also held that when a railroad corporation such as the Rapid Transit Lines does not operate a sufficient number of its own trains on that right-of-way it is permitted to enter into an agreement with another railroad for the joint use of that route.

The case of the Chicago Motor Coach Company has been pending in the Supreme Court since 1926. It was carried there by the bus company from a decision by the Circuit Court which upheld the contention of the city that companies which seek to operate must secure permission from the City Council for the use of streets as bus routes. As in the North Shore Line case, the Supreme Court held that a certificate from the commission was sufficient.

The city has filed notice with the Supreme Court that it will seek a rehearing of its case before July 18.

Taxis Give Jitney Service in Washington

Announcement on the part of the Independent Taxicab Association of the District of Columbia that it intended to start 10-cent jitney taxi service during the morning rush hour, was carried into effect on July 12.

Railway men do not believe that the taxicab organization can handle more than a thousand passengers a day, but the objection is raised that by acceding to the request of the independent owners, the way will be open for all the taxi organizations to start similar operation. All taxicabs in the city cannot be operated even during part of the day as jitneys without disrupting the common carrier service of the existing railway and bus lines.

As a precaution the Public Utilities Commission had notified the Independent Taxicab Owners that they must make formal application if they wish to institute service of this kind so that a hearing could be called on the subject, but the taxi men ignored this warning.

Moreover, due to the loose organization of this association, practically no protection is assured the public in the form of liability bonds. Regulation by the commission of the taxicabs as they are now run is a mooted question, but the matter will most surely go into the courts for adjudication now that the taxi association has carried out its new plan, it being pointed out that whatever the legal opinion may be regarding the present status of taxicabs as common carriers, the uncertainty would be removed should taxicabs engage in clearly common carrier service. On the other hand, the taxi men are said to rely on the idea that classification as common carriers is determined by whether or not a fixed route is followed. If that is true they could escape this supposed definition by following any route from time to time.

Sight-seeing Continues in Montreal

Approximately 100,000 passengers patronize during the summer months the sight-seeing car service supplied by the Montreal Tramways, Montreal, Quebec, around the mountain there. Five years ago the patronage totaled 66,000. The trip is approximately 12 miles, takes one hour and costs 25 cents per passenger.

In June 25 years ago the Montreal Tramways instituted this service. In those days an ordinary open car was used. Appropriate placards were placed on the car and a guide was in attendance announcing points of interest. From the start the service proved popular and it soon became evident that larger cars would be desirable. In the fall of 1904, D. E. Blair, now general superintendent of the company, attended the St. Louis Exposition, and there noted a new type of sight-seeing car. He suggested a new design and it was accepted. The first observation car of the new type was built in the spring of 1905. Two new cars were purchased for this service a few years ago, and six are now available in service. Consistent increase has been experienced in the receipts from this service.

Appreciation in Fitchburg

Fitchburg, Mass., apparently appreciates the work done by the officers and directors of the Fitchburg & Leominster Street Railway as indicated by a recent meeting of the board of directors of the Fitchburg Chamber of Commerce at Whalom Inn, one of the concessions at a park owned by the railway. The chamber directors invited all of the newspaper reporters in the city to be their guests at the "booster" meeting, the purpose of which was to show in positive form a type of publicity which was favorable to the city.

C. Willis Bennett, president of the chamber expressed the opinion of its 1,000 or more members in congratulating Emerson W. Baker, president of the company, for having a place as fine as Whalom Inn and for his work in reorganizing the Fitchburg & Leominster Street Railway. He referred to the installation of new cars and buses and the service the people were getting, which has restored their confidence in the company. He said that the park had helped make Fitchburg an ideal convention city and that it was to Mr. Baker's credit that all these things had been done.

In reply President Baker explained something of the problem confronting him. He said that for five months of 1926 the company showed a difference between income and expense of $18,000; in five months of 1927 a difference of $30,000 and this year for five months a difference of $51,000. He said in part:

We have stricken out many car-miles, representing about $60,000 in expenses. We have found that more people are riding today on electric cars here than two years ago. We have had to analyze our problem and then plug the gaps we found. At the park here not long ago there wasn't a roof that didn't leak. We put $27,000 into it and public response was immediate.

They stop boosting at Fitchburg long enough to be snapped

$500,000 Improvement Program for Dallas

In working out the agreement as to improvements to be carried out by the Dallas Railway & Terminal Company, Dallas, Tex., Supervisor of Public Utilities John W. Everman is understood to have insisted that the present schedule of fares be continued for the next three years. At first railway officials opposed a clause that would bind them to maintain the present rates without seeking for higher fares, but it has since been indicated that an agreement is near completion and that in accepting the schedule of improvements to be made, the company will not oppose the continuation of the present 6-cent-token, 7-cent cash fare. Earlier this year the company sought a higher rate and after a long drawn-out public hearing before the City Commission, withdrew its application "without prejudice."

Improvements totaling in cost more than $500,000 are to be carried out by the railway under Everman plan No. 5 under which the railway is committed to finish the extension of the Junius Heights car line as soon as litigation is concluded and it is made legally possible.

Paving Relief Secures Retention of Redlands Line

The Railroad Commission of California has dismissed the application of the Pacific Electric Railway, Los Angeles, Cal., to abandon service and remove its tracks on its Smiley Heights line in Redlands, an agreement having been reached between the applicant and the city to the effect that if the railway would continue the operation of the line the city would not require the company to pave its tracks on Cypress Avenue, Center Street, or Cedar Avenue when these streets are improved with an expensive type of paving. It was agreed that the company would make repairs estimated to cost $5,000 so that the track would not form an obstruction to vehicular traffic.

Commission in St. Louis Named

Mayor Victor J. Miller of St. Louis, Mo., announced the personnel of the city's Transportation Commission on July 9 which shall endeavor to solve traffic problems. The seven citizen members of the commission are:

E. J. Russell, chairman of the City Plan Commission and member of the architectural firm of Mauran, Russell & Crowell, chairman; August A. Busch, president of Anheuser-Busch, Inc.; C. P. Delore, president of the South St. Louis Business Men's Association; A. H. Reller, president of the Bremen Bank; Claude B. Ricketts, manager of the Railway Exchange Building; F. X. Salomon, general manager of the Famous-Barr Company's department store and Erastus Wells, vice-president of the St. Louis Union Trust Company and a son of Rolla Wells, who served as receiver for the United Railways, the predecessor to the present St. Louis Public Service Company.

The other members of the commission, as fixed by ordinance, are: One member of the Board of Alderman, Edward L. Kuhs, Alderman from the first ward; Mayor Miller, City Comtroller Louis Nolte, E. R. Kinsey, president of the Board of Public Service; Walter J. G. Neun, president of the Board of Aldermen, and Director of Streets and Sewers Brooks.

Samuel W. Greenland, vice-president and general manager of the St. Louis Public Service Company, will represent the company on the Transportation Commission. The Missouri Public Service Commission will also select a member for the commission.

At the first meeting of the commission on July 9 Mr. Kinsey suggested that a transit survey made in 1926 by C. E. Smith, then consulting engineer for the city, be used as the basis for the new survey.

Fare Petition in Springfield Suspended

The petition of the Illinois Power Corporation for an increase in fares in Springfield, Ill., has been suspended until Jan. 7, 1929, by the Illinois Commerce Commission. Hearings will be held in the meantime. The company is seeking to establish a 10-cent fare with three tokens for a quarter and a children's fare of 5 cents. At present the 10-cent fare is basic, but two tokens are sold for 15 cents. The fare for children is 3 cents.

Abandoned Rights-of-Way in Portland Offered to County

The Portland Electric Power Company, Portland, Ore., has offered free to the County of Multnomah, a section of the Mount Hood electric road from Montavilla to Gresham and a part of the old Troutdale line. These abandoned rights-of-way are from 60 to 100 ft. wide. The county must bear the expense of moving the poles, however, which would entail an expenditure of about $7,500. The county commissioners, however, favor acceptance of the offer as it will make certain highway extensions possible.

New Fare Schedule

Increase authorized on lines in Maine. Commission scores lack of public co-operation. Economic laws require increased rate

PRINCIPAL changes provided in a recent decision of the Maine Public Utilities Commission include the elimination of the present ticket fares, the adoption of cash fares for all travel and an increase in the length of the present zone limits on the lines of the Cumberland County Power & Light Company, Portland, Me. The decision was handed down after a lengthy review of facts and figures brought to the attention of the commission in the recent hearing and after a survey of the financial structure of the railroad department of the company. Although fare increases were prescribed over most of the 77 miles of line operated by the company, in one or two instances a decrease of the present rate was obtained.

Proposed rates provide an initial cash fare of 10 cents for a two-zone ride or less and the establishment of a 5-cent cash fare for each additional single zone. School tickets on the basis of 5 cents for a continuous ride of three zones or less are to be continued, and will be valid for a two-zone ride or less.

The former zone system was composed of single zones constituting distances of approximately 1 mile. The 8-cent ticket fare permitted a continuous ride of three zones or less. A passenger having paid the initial 8-cent ticket fare might continue to the succeeding zone in excess of the first three zones on the basis of a ticket fare of 2⅔ cents per single zone. The cash fare of 10 cents entitled the passenger to a continuous ride of three single zones or less, and on the payment of the initial minimum cash fare might continue through succeeding zones on the basis of a cash fare of 3 cents per single zone.

Figures submitted by the company are:

CUMBERLAND COUNTY POWER & LIGHT COMPANY PORTLAND RAILROAD DEPARTMENT INCOME STATEMENT

Year	Total Revenue	Operating Expense	Deductions for Lease of Road and Taxes	Deficit
1918	$1,216,357	$993,820	$332,792	$110,255*
1919	1,513,500	1,244,210	349,634	80,344*
1920	1,667,372	1,425,103	362,981	120,711*
1921	1,696,279	1,391,938	367,136	62,795*
1922	1,668,239	1,304,275	368,876	4,912*
1923	1,703,458	1,377,771	366,584	40,897*
1924	1,582,263	1,274,907	367,420	60,064*
1925	1,451,902	1,165,195	360,926	72,220*
1926	1,402,767	1,178,620	351,959	127,812*
1927	1,296,423	1,115,843	352,433	171,853*

* Operating deficit.

The commission said that these figures forced it to the inescapable conclusion that an increase in fares must be granted or the patrons "must pay increased rates for their electricity sufficient in amount to compensate for annual deficits, if any." It held that economic laws demanded increase and that while the business of the company was charged with a public duty, such duty implied a corresponding obligation on the part of the public to accord financial support to the company if the service were to be continued in its entirety. It could only be continued if such cooperation were given by the public as would enable it to discharge efficiently its public undertaking. Further there were many persons who did not use the electric road facilities and in justice these should not be required continuously to contribute to offset such deficits. The company was praised by the commission for its accurate methods of bookkeeping.

Singing Out of Tune

IF WE were on a Public Service Commission and heard a refrain that the commissions favor the corporations, we would probably join that part of the congregation which loses its temper, easing our dudgeon a bit perhaps by agreeing with James Whitcomb Riley:

> "I've allus noticed grate success
> Is mixed with troubles, more er less,
> And it's the man who does the best
> That gits more kicks than all the rest."

Not being on a Public Service Commission, however, but being familiar with commission decisions against corporation contentions over a long period of years *we can't help joining that part of the congregation which laughs* when we hear these pro-corporation notes. If you have any doubt as to the fact that commissions are not pro-corporation, open the books and see how often the commissions have been reversed by the courts on the ground of being unfair to the corporations.—H. C. Spurr in *Public Utility Reports.*

Safety Pennant Won in Portsmouth

The Portsmouth division of the Virginia Electric & Power Company, Richmond, Va., unfurled a safety pennant on June 14 which it won in competition with the Richmond, South Richmond, Petersburg and Norfolk divisions of the company. The trophy was offered by President W. E. Wood for excellence in safety work and Portsmouth established the leading record for the month of May by operating the greatest number of miles per accident. Miles operated per accident during that month were more than 62 per cent over May of last year.

Recent Bus Developments

Three Per Cent Bus Tax Held Valid in Alabama

A recent act of the state Legislature fixing a 3 per cent privilege tax on the gross receipts from buses and taxicabs "operated for hire in Alabama" has been held constitutional by the Alabama Supreme Court. The decision was rendered on an appeal from the Elmore County Circuit Court in a case brought against Henry Clifton to recover privilege tax for the operation of buses. Mr. Clifton's lawyers contended that the legislative act fixing this tax was unconstitutional.

Bus Purchase Approved in New Jersey

Approval of the sale of one bus operated by the Maurice River Transportation Company between Millville and Vineland, N. J., by way of Malaga Road, to the Public Service Coordinated Transport has been announced by the State Board of Public Utility Commissioners of New Jersey. The commission has also approved purchase by the Public Service of a bus operated on the South River-Milltown route by Anthony Daskiewicz.

Bus Will Supplant Car Line on Denver Interurban

The Denver & Crown Hill Railway, subsidiary of the Denver Tramway, Denver, Colo., operating cars from 29th and Wolf Streets to the Crown Hill cemetery, a distance of about 1 mile, has notified the Public Utilities Commission that on Aug. 1 it will abandon its line, take up its track and cover the territory with a bus. A permit to operate a bus in conjunction with the car line was granted a few months since and the bus is favored to supplant the car.

Binghamton Bus Transfer Under Advisement

The Public Service Commission has taken under advisement a petition for the transfer to the Binghamton Railway Bus Lines, Binghamton, N. Y., of three certificates under which the Triple Cities Bus Lines operate. It was pointed out at a recent hearing that if the transfer is approved the company will take over the rolling stock and equipage free and clear. A restatement of the advantages of co-ordination of routes and elimination of competition was also read into the record. Commissioner of Public Works V. W. Burley, who also is superintendent of the railway, testified that he had acted in an advisory capacity with relation to operations of the bus lines. He told about the short term leases entered into between the railway, which owns virtually all the bus stock, and E. J. Dorey, operator of the Triple Cities lines. The transfer was not opposed.

Lines in Massachusetts Authorized

The Massachusetts Public Utilities Commission has granted the petition of the Springfield Street Railway for authority to operate a bus line with service at two-hour intervals during the day between Victoria Square, Springfield, and Palmer. Another line is authorized to connect with the North Wilbraham line, and with the Springfield-Worcester line, the last being for the accommodation of school children and factory workers.

Bulletins in Baltimore Encourage the Men

Adrian Hughes, Jr., superintendent of bus transportation of the United Railways & Electric Company, Baltimore, Md., has been placing on the bulletin boards in his department helpful suggestions and interesting data of original character, or gleaned from other sources. Sometimes it is a combination of both, a clipping being supplemented by some personal comment. A recent interesting bulletin was taken from a newspaper and showed the reciprocal obligation of an employee in a plain common-sense way.

New Lines Started in Kansas City

The Kansas City Public Service Company started two new bus lines in Kansas City, Kan., beginning July 8. This is a part of an extensive rerouting program which involves three intercity street car lines and other Kansas City, Kan., lines.

Ohio Permit Revoked

State commission rules against interstate carrier which persistently abused its operating rights by carrying passengers in local service under subterfuge

THE Public Utilities Commission of Ohio recently made plain its position with respect to common carriers which disregard the restrictions imposed by it in granting certificates of convenience and necessity when it ordered the Detroit-Cincinnati Coach Company, Inc., to desist from all operation in that state under the certificate previously awarded. The proceeding came before the commission on complaints filed by the Western Ohio Railroad, the Toledo, Bowling Green & Findlay Railroad, the Lima-Toledo Railroad, the Cincinnati, Hamilton & Dayton Railroad and the Dayton & Troy Railroad, electric lines, against the Detroit coach line which was granted a certificate on Oct. 4, 1927. Under the terms of the grant it was authorized to operate in interstate service only through Ohio between the Ohio-Michigan state line, north of Toledo, Ohio, and the Ohio-Kentucky state line between Cincinnati, Ohio, and Covington, Ky., its entire operation being between Detroit, Mich., and Covington, Ky.

The complainants contended that the respondent engaged in the performance of a subterfuge intrastate operation. Witnesses testified to the purchase of tickets in Cincinnati to Monroe, Mich., —which is just across the Ohio-Michigan line—even though they stated that they wished to go only as far as Toledo, being advised that they could get off at Toledo, although in order to escape the requirements of the law the ticket had to read "Monroe, Mich." Witnesses also testified that they had purchased tickets in Toledo when they were bound for Cincinnati, Ohio, although they advised the ticket sellers of the same; these witnesses testified that they were told they must purchase tickets which read "Covington, Ky." Covington is just across the state line from Cincinnati. The record also contained evidence to the effect that passengers going to and from intermediate points within the state of Ohio along the respondent's line were also transported according to their wishes.

The commission was led to conclude that the violations alleged by the complainants were fully substantiated. The commission found that the coach line, under interstate certificate No. 2749, had performed an intrastate service without having first obtained a certificate of convenience and necessity for intrastate operation. The commission also found that the respondent had at various times violated the laws of Ohio and the rules of the commission in operating its vehicles at an excessive and dangerous rate of speed.

The commission has always held that it is an established principle of law that one may not evade reasonable state and local regulation by the mere linking of intrastate transportation to an interstate operation. This is the gist of the finding of the Supreme Court of the United States rendered on Jan. 3, 1927. According to the commission it is also clearly the law that a state has power in public interest reasonably to control and regulate the use of its highways so long as it does not directly burden or interfere with interstate commerce.

The respondent questioned the right of the commission to revoke its certifi-

Digitized by Google

cate, yet it invoked the commission's jurisdiction when applied for the right to run. In this connection the Ohio commission quoted the Supreme Court of Ohio as follows:

1. Sections 614-86 to 614-102, inclusive, of the general code of Ohio, are designed to regulate motor transportation, governing all motor vehicles operating over the highways of the state, but do not authorize the Public Utilities Commission to exclude motor transportation companies operating in interstate traffic from such highways.

2. Motor transportation companies operating in interstate traffic are subject to the provisions of said sections and the regulations therein provided may be applied to all interstate operators, except in so far as such application would involve a direct burden upon interstate commerce.

3. A condition in a certificate of convenience and necessity granted to an interstate operation that passengers may not be received within the state of Ohio whose destinations are also within the state of Ohio is not an unreasonable condition, and does not operate as a direct burden upon interstate commerce.

The commission then referred to the fact that in Clark, et al vs. Public Utilities Commission of Ohio, the Supreme Court of the United States on May 31, 1927, held that the users of state highways, although engaged exclusively in interstate commerce, are subject to regulations by the state to insure safety and convenience and the conservation of the highways. The commission said that it had always recognized that no discretion exists as to the issuance of a certificate so far as convenience and necessity are concerned, where the carrier is engaged exclusively in interstate commerce and has applied for a certificate and complied with the other provisions of the law. The commission, however, deems that it does possess a discretion so long as reasonable provisions of the law are not complied with. Thus, without the performance of certain conditions precedent, the commission may refuse to grant an interstate operator the right to do business. This power of the commission to create also carries with it, if the law is not complied with after legal inception of operation, the power to destroy. In so holding, no one is discriminated against nor is interstate commerce obstructed.

Under the protection of its certificate to operate in Ohio in interstate commerce only, the coach line, in fact, carried on an intrastate transportation of passengers. In this way it did indirectly that which it could not have done in a direct manner. The state body said:

All motor transportation companies operating within the state of Ohio, whether they be engaged in intrastate or interstate commerce, are compelled to comply with the police regulations of the state. The commission has always taken the position that violations of this nature, if sufficiently aggravated, are a proper ground upon which to base revocation. If aggravation ever existed, it is to be found in the instant case.

On a record such as is to be found herein, this commission does not hesitate to pass upon the intricate legal propositions involved, even though they bear upon the whole subject of motor transportation in interstate commerce. The principle at stake is vital and the commission has no desire to escape what is its manifest duty.

If this commission does not have the power to revoke an interstate certificate for violations of this nature it cannot possibly regulate transportation service within the state of Ohio. As a commission, we cannot submit to such an interpretation of the law. It is our duty to curtail such illegal, unethical, unfair and reprehensible practices. No transportation company by mere evasion will be permitted to turn what is clearly an intrastate movement of passengers into interstate commerce for the purpose of claiming the protection of federal statutes.

Commission Plan on Baltimore Bus Business Relinquished

After consideration of the matter from every angle, the United Railways & Electric Company, Baltimore, Md., has decided to discontinue, effective July 15, the plan of paying employees a commission of 5 per cent on chartered bus business they obtained. A serious obstacle to its practical success according to *Trolley Topics*, the official publication of the company, is the fact that the 5 per cent commission eats heavily into the very narrow margin of profit on this business.

Buses Replaces Railway in Grosse Pointe

Buses of the Detroit Motorbus Company, Detroit, Mich., went into operation recently on the route between Grosse Pointe and the city limits at Jefferson Avenue, following cessation of service by the Detroit United Railways. The railway service was halted by order of the village of Grosse Pointe, which contends that the company's franchise to operate through that municipality expired at midnight on April 30. The buses run from the city limits via Fisher Road, Grosse Pointe Boulevard, Provençal Boulevard and Lake Shore Road.

Counsel's Ruling Affects Seattle Taxicab Status

Way was cleared for a final decision in the taxicab controversy in Seattle, Wash., when Corporation Counsel Thomas J. L. Kennedy, in an opinion to the Council, ruled that the Council can legally grant the franchise sought by a group of local capitalists, represented by Robert S. Macfarlane, giving them a monopoly of the taxicab business in Seattle. Mr. Macfarlane's clients propose to form a $1,000,000 corporation, buy out all the existing taxicab companies, deed the cabs and other property to the city for $1 and then lease them for a period of 50 years, paying the city as a franchise tax 2 per cent of their gross receipts. The proposed corporation would have exclusive rights to operate taxicabs, subject to police regulations imposed by the Council.

Pending a decision on that proposal, the City Council has under consideration two ordinances for regulating the taxicab industry, one prescribing a metered-fare basis for all taxicabs, and the other permitting either a meter or zone system of charges.

Municipal Operation of Buses Rejected in St. Paul

A charter amendment to permit the city of St. Paul, Minn., to buy, own and operate transportation facilities inside the city limits was defeated recently when the measure failed to receive the 60 per cent of the vote necessary to carry. The proposal to amend the charter followed refusal of the voters at the last election to adopt an amendment allowing the City Council to vote expense relief suggested by the Minnesota Railroad & Warehouse Commission to enable the St. Paul City Railway to come nearer the 7½ per cent return on its valuation authorized by the commission. It had been suggested that the company be relieved of cost of paving between tracks where the streets were already paved.

The bureau of municipal research regarded the measure as the opening wedge for a municipal bus line involving an initial cost to taxpayers of "not less than $11,010,000." The enabling act would have permitted five members of the Council to submit a bond issue proposal that would require only a majority vote at an election for ratification, and would commit the city to municipal ownership and operation of a bus line.

Replacement on New Castle Line

Permission was granted the New Castle Electric Street Railway, New Castle, Pa., by the Public Service Commission on June 26 to discontinue service on the Grant Street line and on a portion of another line to Cascade Park. Action on discontinuing service from Mill Street and Long Avenue was withheld pending submission of additional facts.

The commission approved the application of the Pennsylvania-Ohio Coach Line Company to operate buses to serve the territory in which railway service was discontinued. The bus company is a subsidiary of the Pennsylvania-Ohio Electric Company.

Public Decide on Bus Service in Richmond, Ind.

A report approving the petition of the Terre Haute, Indianapolis & Eastern Traction Company to the Indiana Public Service Commission for authority to establish a bus service in Richmond has been made by the commission and adopted by the City Council of Richmond. The report will be submitted to a public hearing.

Financial and Corporate

Voting Trust in Brooklyn Terminated

Holders of voting trust certificates of the Brooklyn-Manhattan Transit Corporation will be notified soon of the termination of the agreement and of the resignations of Albert H. Wiggin, Gerhard M. Dahl and Frederick Strauss as voting trustees. The agreement was renewable by its terms for another five-year period, but upon decision of the trustees it was allowed to terminate. The stockholders will meet on Sept. 10 for the first time since the company was organized on May 24, 1923, to elect directors and transact company business.

The voting trust agreement expired on July 1, last, and on July 5 the B.-M. T. applied for listing of 249,468 shares of series A no par preferred stock and 769,911 shares of no par common stock, comprising its total outstanding shares of both classes. These shares will supersede the voting trust certificates after trust certificate holders have been notified of the termination of the agreement and have received an opportunity to exchange their trust certificates for stock certificates.

An official, who has been in close touch with the lengthy negotiations in which representatives of the company, the Board of Transportation and the Transit Commission have participated during the past four or five months, has indicated that the corporation, in terminating its trust agreement and seeking to list its shares, was paving the way to final negotiations with the city by removing the financial framework set up as essential following the reorganization of the Brooklyn Rapid Transit in 1923.

Ontario Road to Pass to Hydro

The final stage appears to be approaching in the deal by which the Windsor, Essex & Lake Shore Railway will be taken over for operation by the Ontario Hydro-Electric system. Before the transfer can be effected to the association of municipalities which will be the real purchaser, a deed must be given by the Dominion Light & Traction Company, present owners, turning over the property free of encumberance and on receiving it formal application must be made to the head office of the Hydro Radial Commission in Toronto for operation of the line.

Until the deed has been executed operation by the Windsor, Essex & Lake Shore Railway under present management will continue. Even after Hydro management starts, the present cars will be continued in use. Immediate work probably will be started on the roadbed, however, and as soon as possible cars now in use will be scrapped for the regular type Hydro cars. Officials of the hydro system plan to develop excursion business to lakeside parks.

Under the arrangement now proposed an additional amount of debenture charges will have to be divided among the nine municipalities included in the association which will purchase the railway. The sum that must be added to the amounts previously fixed for the nine municipalities is $121,000, made necessary by the fact that three townships have withdrawn from the association and it has become necessary for the remaining ones to assume the amounts that would have been theirs. It will be necessary for municipal councils to approve the change, but representatives of the towns have expressed the opinion that the vote in each case would be favorable.

T. C. Cherry Named Receiver

Talmadge C. Cherry has been appointed receiver of the Syracuse, Lake Shore & Northern Railroad and the Auburn & Northern Electric Railroad by Supreme Court Justice Ernest I. Edgcomb. Mr. Cherry has been temporary receiver in the bankrupt concerns for several months. He has also since April 29, 1927, been receiver of the Empire State Railroad, which operates the other two roads.

Officials of the Syracuse, Lake Shore & Northern filed a petition for voluntary dissolution the first of the year. Later suit was brought to foreclose a mortgage for $2,500,000 under which the American Exchange-Irving Trust Company acts as trustee in the interest of the holders of the bonds.

The Auburn & Northern company is in bankruptcy and a mortgage of $250,000 is being foreclosed. The business of the railroads will be carried on by Mr. Cherry pending disposition of the cases.

Sale of Des Moines Road Ordered

Judge Martin signs decree under which property will be auctioned to satisfy creditors. Many interesting issues involved in managing the property

THE property of the Des Moines City Railway, Des Moines, Ia., in receivership since Nov. 11, 1927, was ordered sold in a decree signed on July 9 by Federal District Judge Martin J. Wade at Des Moines.

The sale was made contingent upon the failure of the company to pay debts of $1,759,152 within three days after the filing of the court's decree.

As a report just filed with the court by C. L. Herring and F. C. Chambers, receivers, showed only $118,000 on hand with which to satisfy the creditors, the three-day time limit set by the court was considered in the light of a legal formality.

E. J. Kelly, of the law firm of Miller, Kelly, Shuttleworth & McManus, Des Moines, was appointed special master to conduct the sale at a date to be fixed at the request of Chapman & Cutler, Chicago, attorneys for the Harris Trust & Savings Bank, trustee for holders of $700,000 of 7 per cent bonds upon which payment has been defaulted.

The bonds were dated March 28, 1922, and were payable April 1, 1927. The company had retired $82,000 of the bonds and had paid the interest up to the date of maturity, but was unable to refund the issue or meet the principle when it came due. However, since April 1, 1927, interest has accrued to the amount of $55,036.

Sale of the railway is subject to a first mortgage of $5,762,000 made Jan. 1, 1916, to secure an issue of 5 per cent, twenty-year gold bonds of which the Harris Trust & Savings Bank also is trustee. The company has canceled $941,000 of this obligation, leaving $4,821,000 outstanding. Interest charges of $241,050 annually on this issue have not been defaulted.

One of the most important aspects of the forthcoming sale in the eyes of the general public in Des Moines was declared to be the possible fate of the famous two-man car agreement signed by the men's union and the railway in 1915. Under this arrangement, entirely outside of the present franchise, the company agreed to use a motorman and a conductor on every car for 25 years.

Under the terms of the decree the master is authorized to sell the property of the company subject to agreement or not so subject. He is instructed to offer first "parcels A and B and C." Parcel A sets out the physical property. Parcel B enumerates several contracts necessary to the operation of the property, including the franchise with the city of Des Moines. Parcel C enumerates a number of miscellaneous contracts, leases, agreements and instruments to which the railway "is apparently a party, but which are not essential as constituting an integral part of the operating property." The two-man car agreement was listed under this classification.

If no offers are made for the three parcels, the master is instructed to offer only parcels A and B. As the company officials have stated repeatedly that the railway cannot operate at a profit as long as it is prohibited from instituting one-man car service, it is not considered likely that any purchaser will bid on the first offer.

Attorneys for the receivers hold that a sale will do away with the two-man car agreement as between the carmen's union and the purchaser. However,

Digitized by Google

J. Ben Wiley, secretary of the union, who has successfully resisted all attempts so far to abolish the agreement, contends that the contract was made not only with the Des Moines City Railway but also with its "successors and assigns," and that it will be binding upon any purchaser of the property.

It is anticipated that the union will go into court for a decision on this point.

The necessary legal procedure and the advertisement of the date and terms of the sale will require several weeks, and it is not expected that the sale will be held before Sept. 1.

The court set no minimum amount as a reasonable sale price.

The property of the railway is valued at approximately $10,000,000. This includes tracks, overhead equipment, rolling stock, carhouses and the power plant, all said to be in first-class condition. There has been no appraisal since 1920 but railway officials pointed out that the $1,500,000 put into the system in recent years will more than offset any depreciation in the property.

The railway has operated under a 10-cent fare since July 18, 1925. On June 6, 1926, a Sunday pass selling at 25 cents, and good for unrestricted riding during the day, was instituted. On Sept. 20, 1926, the company instituted a weekly pass selling at $1.25 good for seven days of riding. This is still in effect, and affords regular car riders practically a 5-cent fare, as the average number of rides taken each week by passholders is slightly more than 26.

Records show that the company has operated at a deficit every month since May, 1926, with the exception of December of that year, and January, 1927.

$85,000 Betterment in St. Louis Earnings

A decrease of $77,854 in net operating income in 1927 as contrasted with the preceding year is shown by the report of the St. Louis Public Service Company. This reduction is in the face of an increase in fare averaging half a cent during the final six months of the year.

In 1926 the United Railways, predecessor of the St. Louis Public Service Company, showed a deficit of $46,400 while the past year the company had a net income of $38,217. However, this improvement in the financial showing of the company was due to the fact that during December, 1927, the funded debt was greatly reduced with a corresponding reduction in charges, since the St. Louis Public Service was then functioning as the successor company.

However, dividends on the new preferred stock, issued to the holders of the old St. Louis Transit Company 5s and possible payment on the new common stock, the proceeds of which went toward a reduction of the funded debt, also are still to be met out of the net operating income.

Had the old funded debt structure remained in effect for the entire year the deficit for the year would have been about the same as for 1926.

COMPARISON OF THE 1926 AND 1927 EARNINGS IN ST. LOUIS

	1927	1926
Railway operating revenue..	$18,860,716	$18,873,431
Railway operating expense, including depreciation....	14,680,522	14,626,828
Net railway operating revenue.....	$4,180,194	$4,246,583
Loss bus operation.....	10,545	.....
Net operating revenue....	$4,169,649	$4,246,583
Taxes.....	1,819,204	1,818,288
Net income from operation.....	$2,350,444	$2,428,295
Non-operating revenue.....	160,184	202,874
Total income.....	$2,510,629	$2,631,168
Interest funded debt.....	2,297,685	2,398,370
Interest loans notes payable	26,931	.....
Miscellaneous.....	15,998	29,782
Other expense.....	131,798	249,416
Net income.....	$38,217	*$46,400

Berkshire Bond Extension Sought

Clinton Q. Richmond, president of the Berkshire Street Railway, Pittsfield, Mass., has asked the Massachusetts Public Utilities Commission to approve an extension for ten years at 6 per cent interest of $242,000 of bonds. The present rate is 7 per cent. The request was taken under advisement.

Balance in Grand Rapids $128,687

Results of operations of the Grand Rapids Railroad, Grand Rapids, Mich., for the first complete year since reorganization are shown in a statement for the twelve months ended April 30 as follows:

	1928	1927
Gross earnings.....	$1,632,505	$1,762,245
Operating expenses and taxes.	1,121,131	1,211,956
Gross income.....	$511,374	$550,289
Interest and other fixed charges	250,716	339,240
Profit.....	$260,658	$211,048
Accrued dividends on preferred	10,267	100,000
Provision for retirements.....	121,704	179,107
Balance.....	$128,687	*$68,059

*Deficit.

On the 100,000 shares of common outstanding, balance is equal to $1.28 a share.

Trust Company and Utility Form Investment Subsidiary

Formation of the Fidelity Union Stock & Bond Company by the Fidelity Union Trust Company and the Public Service Corporation of New Jersey was announced on July 6. The new company will take over the business of the Public Service Stock & Bond Company and that of the securities department of the Fidelity Union Trust. Its capitalization consists of 180,000 shares of $25 par stock to be issued at $50 a share. The Public Service Corporation will subscribe for 100,000 shares and the remainder will be taken by the trust company.

It is understood that common stockholders of the Public Service Corporation may participate in the subscription for the new stock in approximately the proportion of one share for each 40 shares of Public Service common held, and that shareholders of the Fidelity Union Trust will participate to the extent of one new share for every three shares now held.

J. Henry Bachellor will be chairman of the board of directors and Charles G. Colyer will be president. Other directors will include Uzal H. McCarter, William Scheerer, Edmund W. Wakelee, P. S. Young and Thomas N. McCarter.

E. H. Maggard Purchases Petaluma Line

Purchase of the Petaluma & Santa Rosa Railroad, Petaluma, Cal., by Edward H. Maggard, president of the Northwestern Pacific Railroad, was announced on July 5 by Mr. Maggard, who said the purchase price was approximately $1,500,000. He added that it was he, personally, who purchased the road and he who would operate it. Mr. Maggard was formerly president of the Petaluma lines before he left to assume charge of the Northwestern a year ago.

The Petaluma & Santa Rosa Railroad is 50 miles long, and connects Petaluma, Santa Rosa, Sebastopol, Forestville and other towns throughout Sonoma County. At present it connects with the Southern Pacific lines at Petaluma, providing through shipments to and from the East by way of the Southern Pacific lines. The road is an all-electric line and is one of the most profitable of the smaller lines of California, feeding, as it does, from one of the richest agricultural sections of the state. Mr. Maggard announced there would be no change in the operation of the lines under his ownership.

The purchase by Mr. Maggard recalls some interesting history centering about the Northwestern Pacific, Southern Pacific and Western Pacific lines.

The Northwestern is owned jointly by the Santa Fe and Southern Pacific. The Western Pacific is owned by Arthur Curtis James, who is also a large stockholder in the Great Northern and Northern Pacific, the Hill lines, which have been opposed by the Southern Pacific for several years in their efforts to extend their lines southward into California.

Six months ago the Northwestern filed with the Interstate Commerce Commission a request for a permit to buy the Petaluma lines. Immediately thereafter the Western Pacific protested, informing that body that it had been negotiating with the Petaluma lines for the purchase of the road for several months. An application was also filed for a permit to buy the lines. The commission set a date when both applications would be heard in San Francisco.

Although the permission of the Interstate Commerce Commission is necessary for one railroad to purchase another, there is no such restriction on an individual.

The sale of this property was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 17, 1927, page 1131.

Book Reviews

Soil-Corrosion Studies

Bureau of Standards Soil Corrosion Studies. I—Soil, material and results of early observations. By K. H. Logan, S. P. Ewing and C. D. Yeomans. Published by the Government Printing Office, Washington, D. C., 1928. Price, 50 cents.

Technologic paper No. 368 of the Bureau of Standards is a résumé of studies of soil corrosion made over a considerable period, after a number of years of study of corrosion due to stray electric currents in the earth by the American Committee on Electrolysis and the Bureau of Standards. Since it became evident that in some cases the cause of corrosion could not be decided until it was known whether serious corrosion would occur in uncontaminated soil where no stray currents were present, the Bureau of Standards undertook to conduct an investigation of the relation of soil to the corrosion of pipe. The studies of soil corrosion were begun in 1922 and the field work has been planned so that specimens will be removed at about two-year intervals for a period of ten years. Of the specimens studied, about one-seventh have been removed for examination.

The work is therefore in its initial stage. The present bulletin sets forth in some detail its plans of scope of the investigation and publishes and discusses such data as are now available as a result of the investigation.

The data indicate that in certain regions soil corrosion is an active enemy of buried pipe lines, that the material best suited to resist the action of one soil is not necessarily the best for other soils, and that the use of some form of protective coating is desirable under a number of soil conditions.

Representative Industries in the United States

Edited by H. T. Warshow, comptroller National Lead Company. Henry Holt & Company. New York. 702 pages. Price $5.

A representative selection of manufacturing industries is here presented for the general reader of industrial and business problems. The study of the various industries is contributed by an authority in the field who covers its history, the conditions surrounding its origin in the United States, its relation to American industry as a whole, the growth of its domestic trade, the improvements in technological processes, the growth of its export business, a discussion of its labor problems, a brief history of large consolidations or combinations, and any special developments peculiar to the individual industries.

The chapter on the electric industry is contributed by L. A. Osborne. After a brief review of the electric car, Mr. Osborne states that although the growth of the automotive industry in recent years has restricted electric railway growth the trolley "still remains by far the best means for carrying large numbers of people rapidly and safely in towns and cities." He discusses the important railroad electrification projects and talks about the use of electric power for manufacuring purposes. William H. Woodin discusses the history of railway equipment.

The automobile industry is reviewed by A. R. Erskine, who touches upon commercial vehicle growth, regulation and legislation. Other subjects covered are copper, iron and steel, lumber and zinc.

Year Book, American Engineering Standards Committee, 1928

Published by the American Engineering Standards Committee, New York, N. Y., 87 pages.

In its Year Book the American Engineering Standards Committee not only reviews briefly the work that it has accomplished during the year 1928, but also explains its method of working and its use of available facilities.

There are listed in the book all the projects that on April 15, 1928, had an official status before the American Engineering Standards Committee, including standards that have already been approved and also those publications that are available. Co-operating organizations, members and sustaining members are also listed.

Popularizing Public Transportation

A digest of presentations made by electric railways to the Charles A. Coffin Foundation, edited by Henry H. Norris with an introduction by W. H. Sawyer. American Electric Railway Association, New York, N. Y. 239 pages, exclusive of appendix and index. Price, $2.

OUTSTANDING accomplishments of public transportation companies contained in presentations made by them in 1927, under the Charles A. Coffin Award comprise the fifth book in the series of "Electric Railway Practices." This book presents evidence of the progress of modernization, both in equipment and in method. In this volume the activities of merchandising transportation, advertising, public relations, management, economies, maintenance, power, are set down to add another important chapter to the history of electric railway progress.

Much initiative and resourcefulness are displayed in this array of accomplishments by companies which are overcoming the obstacles in the path of this forward movement in transport methods and are courageously and diligently buttressing an old foundation for future needs. Here is the inspiration for sister companies. As Mr. Sawyer points out in his foreword, as each department endeavors to find its own claims for recognition it is forced to review and compare its own performance with what has been done by other properties so the winners are not the only beneficiaries.

H. H. Norris, the editor, points out that twelve railways contributed to the success of the fifth competition. The salient features of the presentations are summarized in the report of the Charles A. Coffin prize committee, which forms an appendix to this volume. The report is signed by W. H. Sawyer, chairman, James H. McGraw and R. P. Stevens. Much space was given in the digest this year to evidence or testimony as to the substantial accomplishments of the co-operating railways. The material has been edited with a view to facilitating ready reference to the numerous helpful ideas contained within the book. It is suggested that the chapters of the book be used as the basis of discussions in conferences of electric railway of-

Digitized by Google

ficials, and that every official familiarize himself with the text.

As in the case of "Making Transportation Pay," ("Electric Railway Practices" of 1926) outstanding characteristics of good electric railway practice are scattered throughout the chapters in some 31 boxes arranged at the bottom of pages in messages of telling effect. These are based on the text of the book and are a convincing epitome.

In commending the volume to the forward-looking railway executive Mr. Sawyer hopes that "it may be, in turn, as preceding volumes have been in the past, the means of stimulating the industry to even greater improvement and progress."

McGraw Central Station Directory, 1928

Published by McGraw-Hill Catalog & Directory Company, Inc., New York, N. Y 946 pages. Price, $25.

This new, thoroughly revised edition furnishes data on approximately 150 holding companies, 4,000 operating companies, 4,500 plants, and 12,000 managerial and operating officials. There are to be found more data on plants, more data on the territory served by each operating company, more data on company ownership and inter-relation and complete listings of managerial and operating personnel. In addition, new features cover the starring (*) of all holding companies, both in the alphabetical index and in their geographical entries—the listing of all towns served under each operating company—the inclusion of the names of merchandising managers and the addition of state headings.

"Electrician" Annual Tables of Electricity Undertakings

Published by Ernest Benn, Ltd., London. 200 pages. Price 10/9.

This is the 41st edition of electricity undertakings and includes details of projected schemes. Contents cover colonial electric railways and tramways and foreign electric railways and tramways. The statistics relate to more than 800 British and more than 1,300 colonial and foreign undertakings. The publication is of value to all engineers, manufacturers and contractors in the electrical industry and to exporters of and dealers in electrical plant and apparatus.

Railroad Financing

By Mortimer L. Schiff. Extracts from a speech delivered before the New School for Social Research, Dec. 7, 1927. 56 pages.

The contents of this pamphlet cover capital needs, reorganizations and public regulation of security issues. In concluding his dissertation Mr. Schiff said he did not believe competitive bidding was to the interest of either the borrowing corporation or the investing public. Although his remarks referred to steam road financing, they were interesting to electric railway men.

Personal Items

A. J. Stratton Has Added Responsibilities

A. J. Stratton is serving, in addition to his duties with the Southern New York Railways, Mohawk, N. Y., as general manager of the Railway and Bus Associates, a company covering all Associated Gas & Electric System transportation activities. Mr. Stratton is a specialist on track construction. For many years he was engaged in engineering work with the J. G. White Management Corporation and at the same time carried on the work of superintendent of maintenance-of-way of the various lines associated with the Eastern Pennsylvania Railways. At one time he was affiliated with the Mobile and the Binghamton properties; from 1916 to 1918 he was assistant engineer of way and structures of the Brooklyn Rapid Transit Company and from 1918 to 1920 was assistant engineer of the valuation department of the Metropolitan Edison Company, Reading., Pa. On Jan. 1, 1922, Mr. Stratton was made assistant superintendent of the Eastern Pennsylvania Railways and six months later he transferred to the Southern New York Railways.

Eldon Tyler Promoted to Porto Rican Post

Eldon Tyler, assistant chief engineer of the Jacksonville Traction Company, Jacksonville, Fla., has been transferred to Ponce, Porto Rico, as chief engineer of the Ponce Electric Company. The Ponce Electric Company is under the executive management of Stone & Webster, Inc. Mr. Tyler was sent to Jacksonville three years ago from the Eastern Texas Electric Company, at Port Arthur, Tex. He was maintenance engineer there and went to Jacksonville as assistant to John C. Higgs, chief engineer.

Ernest A. Wilkerson, maintenance engineer at Jacksonville, will succeed Mr. Tyler. He has been employed by the Jacksonville Traction Company for ten years.

C. A. Norris, watch engineer of the Jacksonville station, will succeed Mr. Wilkerson as maintenance engineer.

F. E. Schmitt Editor of *Engineering News-Record*

Frederick E. Schmitt, managing editor, has just been appointed editor-in-chief of *Engineering News-Record,* a McGraw-Hill publication, the chosen instrument of information of thousands of engineers and constructors. A statement by James H. McGraw says in part:

The publishers are not unmindful that their task has been an important one—that of selecting and training the men who could deserve this splendid acceptance and support. It is in further performance of this responsiblity that this announcement is made. A successor is needed to the late Frank Wight, of enduring memory, who will worthily carry on the virile work of a line of eminent predecessors.

In appointing Mr. Schmitt, the publishers do so without any faltering or misgivings. He has won his spurs by a long and brilliant journalistic career. He has the confidence of engineers and constructors. He has the ardent support and loyalty of his associates on the staff. We pass to him the mantle of Stauffer, of Wellington, of Baker, of Goodell, of Mehren and of Wight in the full confidence that he will carry the paper to new heights and that our action, in making him editor, will have the hearty approval of the reader.

H. A. Mullett With Manufacturing Concern

H. A. Mullett, prominent in railway and bus fields, and in manufacturing circles identified with those industries, recently purchased the controlling interest in the Bradley Washfountain Company, Milwaukee, Wis., and on July 2 was elected president and general manager.

Early in his career, Mr. Mullett was associated with the Westinghouse Electric & Manufacturing Company at Pittsburgh, Pa. Later he joined the Milwaukee Electric Railway & Light Company as assistant to the superintendent of equipment. The rôle of superintendent he filled from 1911 to 1918. In the latter year he became assistant general manager of the company's city, interurban and bus transportation departments, and a year later his jurisdiction was extended to the company's newly created city and interurban bus divisions. Some few years later, when the Milwaukee property acquired control of the Milwaukee Northern Railway, Mr. Mullett was made vice-president and general manager in charge of operations of that

Digitized by Google

company. He has also been identified with the Yellow Cab Company in Chicago and with the Twin City Rapid Transit Company of Minneapolis.

Mr. Mullett was born in Louisville, Ky., and was educated in the public schools in Kansas City. He was graduated from Rose Polytechnic Institute.

The Bradley Washfountain Company, of which he is the head, manufactures a circular and semi-circular wash fixture for use in industrial establishments, schools, and institutions of all kinds.

Obituary

Robert I. Todd

President of properties centering at Indianapolis and former head of American Electric Railway Association died suddenly of heart attack on eve of committee meeting he had come to New York to attend

ROBERT I. TODD, former president of the American Electric Railway Association and long connected with the Indianapolis Street Railway, Terre Haute, Indianapolis & Eastern Traction Company and other roads centering at Indianapolis, died suddenly in New York on July 13. Mr. Todd had come to New York to attend the meeting of the executive committee of the association scheduled to be held the day he died. He was stricken with a heart attack on his return to his hotel after having visited with his sister.

Mr. Todd was an engineer turned executive. He entered the electric railway field while still a student at the Johns Hopkins University and lived through two periods which saw tremendous changes in the history of local transportation. The trolley was only just beginning to come into its own when Mr. Todd as a fledgling engineer spent his summers in helping to install the electric railway at Raleigh, N. C., one of the earliest lines of its kind in the country. That, of course, was most interesting, but as it turned out the work he did there was strange by contrast with problems he later was called upon to handle, first, in developing the city and interurban lines at Indianapolis, and then in adjusting these lines to the changed economic situation which followed the advent and the intensive development of the bus both in city and suburban operation.

So far as Indianapolis is concerned, the situation there has been materially bettered by the co-ordination of bus and trolley under one management, but the effort to bring about co-ordination required the exercise of a great deal of managerial skill. It was attained only after long negotiations in which the futility of competition in local transportation was brought home forcefully to the people of Indianapolis. So far as the interurbans under his direction are concerned, negotiations under way at the time of Mr. Todd's death are expected to result in a new alignment of these properties intended greatly to enhance their value as common carriers.

Like many other operators who carried through the war-time period, Mr. Todd found himself confronted with problems for which there was no precedent either in the annals of management or in the history of the play of economic forces as they affected business. The most important of the city roads of which he was the head, the one in Indianapolis, was sorely beset because of the long delay in affording the company a measure of relief in the form of an increase in fare, to which stout resistance was experienced from opponents with political axes to grind. Through it all, however, Mr. Todd retained the courteous composure that endeared him to his host of associates, reflected in turn by them in his election to some of the most important posts it was within their power to bestow, among them, in addition to that of head of the American Association, the presidency of the Central Electric Railway Association and the presidency of the American Electric Railway Traffic and Transportation Association.

Robert I. Todd

Mr. Todd was born on Nov. 29, 1869, at Lakewood, N. J. He was educated in the public and private schools of New Jersey and Virginia and was graduated from the Johns Hopkins University in 1893 with the degree of electrical engineer. As indicated previously, Mr. Todd while still a student at that university became affiliated with the railway field, spending his summer vacations in the employ of the railway at Raleigh, N. C. After his graduation he was at first employed by the Eckington & Soldiers' Home Railway, Washington, D. C. This was later consolidated into the City & Suburban Railway and still later into the Washington Railway & Electric Company, of which he served as superintendent and electrical engineer.

In 1899 he left Washington to become connected with the Compressed Air Company, then undertaking the development of compressed air for use on the Metropolitan Street Railway, New York City. Later he did engineering work under M. G. Starrett, at that time chief engineer of Metropolitan company. In 1900 he went to Pittsburgh as mechanical engineer in charge of shops and power houses of the Pittsburgh Consolidated Street Railway, now included in the system of the Pittsburgh Railways.

In the latter part of 1901 Mr. Todd was chosen vice-president and general manager of the Cincinnati Traction Company, but he resigned this position early in 1903 to assume general supervision of the engineering work of the electric railway properties of the United Gas Improvement Company, Philadelphia, Pa. In the following year he was appointed general manager of the Rhode Island Company, Providence, R. I., where he served until 1906, when he went to Indianapolis to become vice-president and general manager of the Indianapolis Traction & Terminal Company and the Terre Haute, Indianapolis & Eastern Traction Company. Following the death of Hugh J. McGowan in 1911, Mr. Todd was elected president of these two companies, the former now being known as the Indianapolis Street Railway.

Among his other activities Mr. Todd this year was a member of the membership committee of the American Electric Railway Association, the joint committee of that association on the national utility associations and the motor vehicle information committee of the A.E.R.A.

HOWARD ELLIOTT, one of America's greatest railroad executives, and an authority on both the practical operation of a railroad and the management of its finances, died in Dennis, Mass., on July 8. He was formerly president of the New York, New Haven, & Hartford and the Northern Pacific Railroad. Mr. Elliott was well known for his successful rehabilitation of the New Haven Railroad. Early in his career he worked as level rodman with the Chicago, Burlington & Quincy in northwest Missouri. This was during the summer between his junior and senior years in the Lawrence Scientific School of Harvard University, from which he took the degree of civil engineer in 1881. Mr. Elliott was born in New York City 67 years ago.

Manufactures and the Markets

$313,100 Carhouse Improvements for St. Louis

The Public Service Company, St. Louis, Mo., plans to expend $313,100 in improvements and alterations at its DeBaliviere Avenue carhouse, including the reconstruction of double track on DeBaliviere from Pershing to Delmar, to cost $35,000; wrecking present wash house and repair shop and making alterations to south bay of west carhouse for repair shop and wash house, $73,800; removing special work on DeBaliviere in front of car yard and constructing new track layout on property, $141,300, and a new office building, $63,000.

The plans call for 25 tracks for the handling of cars into and out of the carhouse.

Into this track enclosure there will be an entrance at Delmar Boulevard and Laurel Avenue and two exists on Delmar Boulevard near DeBaliviere and one on DeBaliviere south of Delmar Boulevard. Providing for the movement of cars always in one direction.

The old station structure will be torn down and the new building will be erected south of the present station and nearer the center of the network of tracks for handling of cars. This building will be most complete and up-to-date, and will have many conveniences for employees, such as shower baths, a tailor shop and barber shop.

Community Traction May Buy Buses

Community Traction Company, Toledo, Ohio, in connection with the negotiations for a new operating plant has come into possession of about 40 buses used previously by independent operators, but while some of these vehicles may meet the requirements of the railway it is indicated that probably 50 new buses will be needed to fill the complement of vehicles of this kind to meet the requirements of the service which the railway has in mind to furnish.

Underground Work for Vancouver

Work on the construction of over 10 miles of underground subways involving an expenditure of approximately $138,000 is either under way or about to be commenced by the British Columbia Electric Railway, Vancouver, British Columbia.

The contract has just been awarded to J. O. McCable, 3442 Eleventh Avenue West for the construction of an underground subway between Cordova and Georgia Streets on Homer Street and the work will commence immediately. The ultimate expenditure on this project will be approximately $25,000. When the subway is completed 12,000-volt high tension cable will be pulled through.

In addition to this, construction of an underground subway containing two new circuits running from Haro Street substation is nearing completion and the work of pulling the cable through is about to be commenced. This subway will be over 2 miles in length.

Over 8 miles of cable is being pulled through subways which are under construction in the vicinity of the Main Street substation. This work will involve an expenditure of approximately $85,000 for the cable work alone, and should be completed by Sept. 1. The cables which are being pulled through the subways from this station include both light and power feeders and railway feeders.

Door Checks for New York Subway

The Transit Commission has announced its approval of the purchase by the Interborough Rapid Transit Company, New York, of some $22,000 worth of gravity door checks to be installed on nearly 2,000 subway cars. These checks will be attached to the top of the end vestibule doors and are designed to prevent the doors from slamming shut when the train takes a curve or lurches for any reason. These checks have been developed by the railroad.

Northern Ohio Improvements

Considerable new track is to be installed this summer by the Northern Ohio Power & Light Company, Akron, Ohio. Double track is to be laid on Main Street from Crosier to Long Streets. The improvement will cost approximately $20,000.

Another improvement on Main Street is from State to Mill, where new double track will be laid to join the new track to the south put down in 1927.

On East Market from the point where Exchange crosses to a point near the intersection of Carroll Street new track will also be laid.

Another improvement in Akron, is the installation of seven safety zones instead of the present loading platforms. These zones will be inclosed with steel posts and lighted similar to the Cleveland plan, the platforms being removed.

A new transfer freight station will be built at Ravenna Junction to facilitate the handling of freight from the Alliance district to points in the Warren, Youngstown and other districts.

The installation of new track on Second Street, Cuyahoga Falls, from Wetmore to North Streets will soon be started. This will be the standard type of construction and will be double track costing about $50,000.

Tracks are to be torn up on Payne Avenue from the Silver Lake Junction carhouse to Notre Dame Avenue and new paving laid with double tracks. This means an expenditure of some $70,000. The entire street is to be improved. At the same time the tracks entering the carhouse at the junction will be rearranged and special work installed.

Wage Earnings Slightly Higher

Monthly inquiries by the National Industrial Conference Board permit an inspection of the general tendency of wages and living cost for the first few months of this year.

Hourly earnings show very little fluctuation and are gradually rising, the average hourly earning for the first two months of 1928 being only one-tenth of 1 cent higher than for the similar period of 1927. The money weekly earnings, however, show considerable fluctuation. The money weekly earnings for the first few months of 1928 are actually 9 cents below the weekly earnings for the same period of 1927. Variation in the number of hours actually worked each week accounts for the apparent decrease in weekly earnings for 1928 as compared with 1927.

While in wages there has been noted a very slight upward trend in recent months, in the cost of living the contrary has been the case. In the first quarter of 1927 the cost of living relative to conditions during 1914 stood at a level of 165.4, and in the first quarter of 1928 at a level of 162.9. All of the major items that enter into the cost of living decreased from 1927 to 1928. The greatest decrease occurred in rent, which dropped about 4 per cent.

This subsidence in the cost of living, combined with approximately stationary earnings, has brought about an appreciable upward movement of real earnings.

The record for the year so far, shows that the wage earner in manufacturing industries is holding his own, and possibly, in a slight degree, has improved his position. It would also seem that the unemployment condition that existed in the latter part of 1927 was magnified, as it has not betrayed itself in a lowering of wages.

Industrial Building Maintains Lead Over 1927

New industrial building construction —physical plant expansion—is an excellent index of business confidence. Companies do not authorize new factories, power plants, or extensions to existing plants, unless they believe they can use them in added production.

Contracts for industrial building construction in 28 industries in the first

Digitized by Google

five months of this year total $124,693,000, compared with $97,947,000 in the similar period of 1927. There were 599 of these contracts, compared with 575 last year. The average value of the 1928 job is $208,158, against $170,342 in 1927. The public utilities group is the leading industry with 53 jobs valued at $23,000,000, which is almost the exact figure for 1927.

The expansion of plants has been quite general, with large increases in the following lines: Paper and pulp, heavy chemicals, manufactured gas, rayon, glass, automotive and refrigeration. All sections of the country, except the Far West, shared in this increased activity in industrial building. Very substantial gains were recorded in New England, the Middle Atlantic States, the South and the region between the Mississippi and the Rocky Mountains.

Isothermos Corporation Formed

Formation of an American corporation to manufacture to American standards the Isothermos journal box, which is now in use on a number of European, African and South American railroads has been announced. The American company is known as the Isothermos Corporation of America, and has its permanent executives offices at 11 West 42nd Street, New York City. The officers and directors of the new corporation are Hubert E. Rogers, president, Rogers & Whitaker, Attorneys-at-Law, 52 Wall Street, New York; A. De Bac, vice-president, chairman of the Societe Internationale Isothermos, Geneva, Switzerland; Dr. F. H. Hirschland, treasurer, president Metal & Thermit Corporation, 120 Broadway, New York, and Spier Whitaker, Rogers & Whitaker, Attorneys-at-Law, 52 Wall Street, New York, and F. O. Willhofft, secretary de la Banque Francaise de l'Afrique, Paris, France.

General Electric Disposes of Subsidiary

According to a joint announcement made by the General Electric Company and the Industrial Acceptance Corporation, the latter has acquired from the former the entire capital stock of General Contract Purchase Corporation, New York, its instalment financing subsidiary as well as its affiliated contract purchase corporations in Boston, Cleveland, Chicago, Dallas and San Francisco.

Arthur J. Morris will be chairman of the board of directors and Percy M. Hall chairman of the finance committee. E. W. Miner, who has been president of the General Contract Purchase Corporation and managing director of its associated companies, continues as president and general manager. Frank J. Scott, vice-president of the Industrial Acceptance Corporation, becomes executive vice-president, and Clinton T. Miller becomes vice-president and controller.

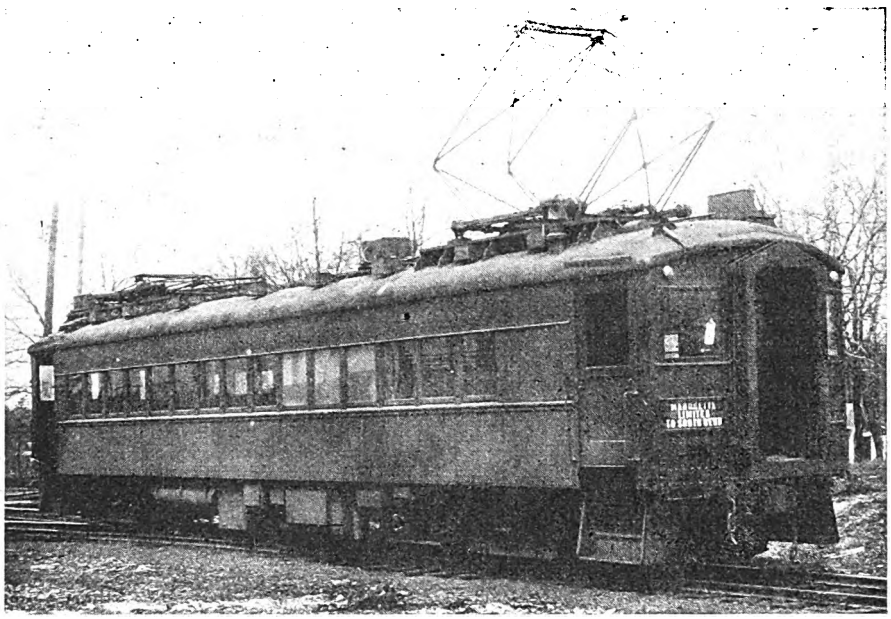
Electric Locomotive Shipments Slightly Lower

Domestic shipments of electric locomotives during the first six months of this year were 76 as compared with 85 locomotives shipped during the similar period in 1927. Foreign shipments during the first six months this year were only two while seven were shipped in the first six months of last year. The total shipments for the year

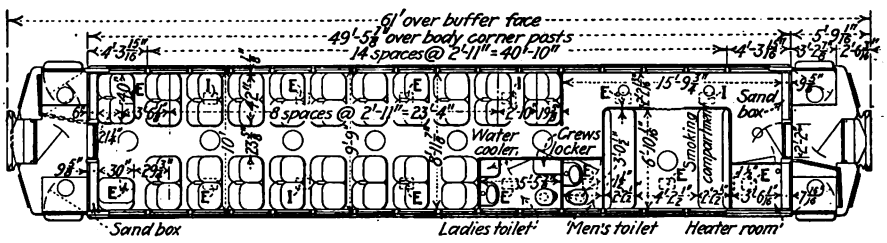
Ten Units Being Built for South Shore Line

Ten interurban, two-man, motor-passenger cars are being built for the Chicago, South Shore & South Bend Railroad, Michigan City, Ind., by the Standard Steel Car Company, Hammond, Ind. The cars, ordered on May 7, will be delivered in November. They are of the double-end, double-truck type, seating 48 passengers.

The new cars will be identical to the Pullman-built units delivered last year except for the elimination of the wooden partition and swing door separating the corridor leading around the smoking compartment from the main seating compartment. The lamps will be operated from a 32-volt battery which will be charged by a motor generator set.



Type of all-steel passenger car being built for the Chicago, South Shore & South Bend Railroad



Floor plan of the South Shore cars being built by the Standard Steel Car Company

Weights: Car body	67,500 lb.
Trucks	33,400 lb.
Equipment	32,700 lb.
Total	133,600 lb.
Bolster centers	38 ft.
Length over all	61 ft.
Length over body posts	49 ft. 6½ in.
Truck wheelbase	7 ft.
Width over all	10 ft. 1½ in.
eight, rail to trolley base	13 ft. 1 in.
ow post spacing	35 in.
Bou	All steel
Roof	Arch
Doors	End swinging
Air brakes	Westinghouse AMU
Armature bearings	Plain
Axles	Standard Steel Co. 5½ x 10 in.
Car signal system	32-volt bell
Compressors	Westinghouse D3F, 1500-volt
Conduit	Metal
Control	Westinghouse type HBF, 1500-volt
Couplers	Ohio Brass Co. No. 23
Curtain material	Pantasote
Destination signs	Hunter
Energy saving device	Economy meter
Finish	Duco
Floor covering	Linoleum (rubber in aisle and smoking compartment)
Gears and pinions	Westinghouse BP
Glass	Plate
Hand brakes	Peacock staffless
Heat insulating material	Balsam wool
Heaters	Peter Smith hot water and Railway Utility Co. electric
Headlights	Portable
Headlining	⅛-in. aluminum
Interior trim	Mahogany
Journal bearings	Plain, 5½ x 10-in
Journal boxes	Symington semi-steel
Motors	Four Westinghouse No. 567-C, inside hung
Painting scheme	Orange and maroon
Roof material	Wood with canvas cover
Safety car devices	Deadman control
Sash fixtures	Brass
Seats	Hale-Kilburn No. 900
Seat spacing	35 in.
Seating material	L. C. Chase Byzantine plush (leather in smoking compartment)
Slack adjusters	Form J
Steps	Stationary
Step treads	Irving Iron Works Safkar
Pantograph	No. 515-C
Trucks	Baldwin equalizer bar type
Ventilators	Railway Utility Co.
Wheels, type	Rolled steel, 36 in. diameter
Wheelguards or fenders	Steel pilot
Special devices	32-volt lighting circuit
Pullman type smoking compartment

1927 were 148 domestic and 29 foreign. The unfilled domestic orders in June, 1928, numbered 37 while last year the unfilled domestic orders in June were 31.

Oudin Decorated by King of Italy

Maurice A. Oudin, vice-president of the International General Electric Company, who has returned from an extended visit in Europe, was signally honored by the King of Italy. In recognition of his good offices in behalf of a closer international relationship and of the specific benefit to the engineering profession of Italy, Mr. Oudin was decorated with the Order of Commander of the Crown of Italy. Mr. Oudin is president of the board of trustees of the Italy-America Society of New York, and has been active in promoting the technical and industrial relations between Italy and the United States.

ROLLING STOCK

DELAWARE ELECTRIC POWER COMPANY, Wilmington, Del., has just ordered ten one-man, two-man, double-truck, double-end cars from the J. G. Brill Company. Mention of the request for bids on these cars was made in the June 16 issue of the JOURNAL.

CALGARY MUNICIPAL RAILWAY, Calgary, Alberta, has been recommended by A. G. Graves, commissioner, and R. A. Brown, superintendent, to purchase three new passenger cars and one new power snow sweeper. The snow sweeper is for next winter but the cars may not be ordered until next year.

LINCOLN TRACTION COMPANY, Lincoln, Neb., is rebuilding its cars. Among the improvements to be made are leather seats and new ceiling lights.

READING TRANSPORTATION COMPANY, Reading, Pa., has taken delivery of five Mack special six-cylinder, 29-passenger, city type buses.

LOS ANGELES RAILWAY, Los Angeles, Cal., has ordered two, double-deck, six-cylinder, Fageol safety coaches.

UNITED ELECTRIC RAILWAYS of Providence, R. I., has purchased another gas-electric drive urban type Twin Coach.

TRACK AND LINE

MANITOBA EASTERN RAILWAY, a subsidiary of the Winnipeg Electric Company, Winnipeg, Manitoba, is planning an electric railway from Whitemouth to the Seven Sisters Falls and Lac Du Bonnet in the central Manitoba mining area, according to an unofficial announcement.

OCEAN CITY ELECTRIC RAILROAD, Ocean City, N. J., is extending its tracks from the old boardwalk to the new esplanade.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINER

	July 10, 1928
Metals—New York	
Copper electrolytic, cents per lb	14.525
Copper wires, cents per lb	16.625
Lead, cents per lb	6.2
Zinc, cents per lb	6.55
Tin, Straits, cents per lb	46.25
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, .o.b. vessel, Hampton Roads, gross tons	4.15
Somerset mine run, f.o.b. mines, net tons	1.825
Pittsburgh mine run, Pittsburgh, net tons	1.775
Franklin, Ill., screenings, Chicago, net tons	1.625
Central, Ill., screenings, Chicago, net tons	1.5
Kansas screenings, Kansas City, net tons	2.25
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	5.3
Weatherproof wire base, N.Y., cents per lb.	17.125
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bb lots) N. Y., cents per lb.	10.3
White lead in oil (100-lb. keg), N. Y., cents per lb	13.75
Turpentine (bbl. lots), N. Y., per gal	$0.61

WORCESTER CONSOLIDATED STREET RAILWAY, Worcester, Mass., has started the reconstruction of 1,122 ft. of track on Southbridge Street from Hammond Street to Quinsigamond Avenue. This job will require 35 tons 7-in. 103-lb. girder; 40 thermit joints; 600 ties; eight kegs of spikes; 1,200 tie plates; 2,000 tie rods and 1,122 sq.yd. paving. The estimated cost of this job is $14,548.

WINDSOR, ESSEX & LAKE SHORE RAPID RAILWAY, Kingsville, Ontario, will be requested to build a 400-ft. siding for the new shipping shed of the Kingsville Fruit Growers' Association.

KANSAS CITY PUBLIC SERVICE COMPANY, Kansas City, Mo., is constructing a car loop at Eighteenth Street and Central Avenue, at a cost of approximately $50,000.

OREGON ELECTRIC RAILWAY, Portland, Ore., announces that the proposed extension in Linn County, Oregon, is estimated to cost $3,004,062. The line will be approximately 40 miles long.

SHOPS AND BUILDINGS

BRITISH COLUMBIA ELECTRIC RAILWAY, Vancouver, British Columbia, is constructing a new station and freight shed to replace those destroyed in the recent fire at Langley Prairie. The work will involve an expenditure of approximately $3,100.

MENOMINEE AND MARINETTE LIGHT & TRACTION COMPANY, Menominee, Mich., will move its Mission Point Building a distance of 130 ft. to make way for the new interstate bridge.

SASKATOON MUNICIPAL RAILWAY, Saskatoon, Saskatchewan, is making plans for a carhouse addition.

ATLANTIC CITY & SHORE RAILROAD, Atlantic City, N. J., will erect a waiting room on the boardwalk at Eighth Avenue.

MONTREAL TRAMWAYS, Montreal, Quebec, will extend its St. Henry Street garage at a cost of about $25,000.

GRAYS HARBOR RAILWAY & LIGHT COMPANY, Aberdeen, Wash., has received a permit from the city engineer to construct a building costing $135,000 as part of a $1,000,000 extension project of the company's plant at Electra Park.

WISCONSIN PUBLIC SERVICE CORPORATION, Milwaukee, Wis., is reconstructing its Green Bay substation.

TRADE NOTES

CHARLES G. MELVIN, formerly with the Galena Oil Company has been appointed New York sales agent of the Griffin Wheel Company, Chicago, Ill. Arthur Hale, vice-president of the company is changing his headquarters from New York to Chicago.

PITTSBURGH TESTING LABORATORY, Pittsburgh, Pa., has just opened an office in Boston at 101 Tremont Street, which office is in charge of Donald L. Macdonald, formerly connected with the engineering department of Stone & Webster.

GIBB WELDING MACHINES COMPANY, Bay City, Mich., has increased its capital stock by $125,000, making a total of $250,000.

VAN DORN ELECTRIC TOOL COMPANY, Cleveland, Ohio, announces that its sales branches in Los Angeles, San Francisco and Seattle, and service branches in Los Angeles, Oakland and Seattle, have been supplemented by the establishment of a complete warehousing and service depot at 525 East Tenth Street, Oakland, Cal.

W. C. GOODWIN, formerly section engineer of the control engineering department, has been appointed manager of the renewal parts engineering department of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. In August, 1926, Mr. Goodwin went to England as liaison engineer for the Westinghouse Company with European companies with which the Westinghouse Company has relations. He represented the Westinghouse engineering department in Europe for almost two years, spending time in England, France, Italy, Norway, Germany and Czecho-Slovakia.

ADVERTISING LITERATURE

CROUSE-HINDS COMPANY, Syracuse, N. Y., has published bulletin No. 2111 entitled "Plugs and Receptacles."

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has issued a 24-page circular, C-1787, on electric equipment for railway signaling.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., has just issued a new bulletin on Wagner bearing construction, in which the Wagner improved sleeve bearing and the Wagner ball bearing construction are fully described and illustrated.

Endurance Records in the Line Department

NUMEROUS reports in the newspapers of the spirit of competition that is hanging up new endurance records for non-stop airplane flights find their counterpart in the electric railway industry. In this field it is an endurance record in keeping the cars running, but the methods that are pursued are somewhat different. With a complete change from the attitude of the old days when the problem was to make repairs when the system broke down, the maintenance forces now are vying with one another in seeing how long the cars can be kept in service without a failure in any department.

It was something more than a year ago that the men of the emergency division of the United Railways & Electric Company of Baltimore were tendered a dinner by the management on the completion of 58 days without a trolley break. The event was hailed as a new mark in reliability. Now the Cleveland Railway's line division has bettered this record, having gone 60 days without a break. These men, too, earned a dinner, and the account of it, published recently in this paper, shows that they were not unmindful of the honor that comes with such a record.

How long it will be until some other maintenance force takes away this record by running a comparable system for a longer time without a broken trolley wire remains to be seen. There is no reason why it cannot be done. The difficulties of keeping the wires intact are as great in Cleveland and Baltimore as they are in other cities. Perhaps these same forces may better their own achievements and set up new records for themselves.

Day Is Better than Night for Inspection

FOR many years there has been a tendency to reduce the amount of night inspection in American electric railway carhouses. The present practice is to do at night only car cleaning and such emergency work as is absolutely necessary to keep the cars running. All regular inspections and repair work are done in the daytime. The latter method has been found more efficient and economical. A plan of this kind permits work to be handled with an inspection force of minimum size and allows the employment of high-grade men who are specialists in their lines and who have been carefully instructed. In the larger inspection shops such an expert is placed at the head of each department to direct the activities of the men under him.

Doing away with night work has reduced materially the amount of pit space needed to facilitate inspection. Under the old plan it was necessary to place all cars due for inspection on the pits as they came in from their runs, since the storage space was crowded and there was little opportunity for shifting. With day inspection the proportion of cars that can be placed over the pits at one time is only about 10 per cent of the total rolling stock. In a recent analysis it was found that the pit space available for inspecting subway cars of the Interborough Rapid Transit Company will accommodate only 11.48 per cent of the cars, and on the rapid transit division of the Brooklyn-Manhattan Transit Corporation only 9.45 per cent of the cars can be placed over the pits at one time. A comparison of these figures with those for European companies, where a large amount of night inspection still is done, is quite enlightening. There the proportion of cars that can be placed over the pits at one time varies from 23 per cent to more than 100 per cent.

Of course, the reduction in pit space requires careful scheduling and necessitates more shifting of cars or trains off and on. With a properly worked out inspection schedule American roads have found that this does not entail any difficulty, while the character of the work obtainable during the daytime makes the change well worth while.

The Conveyor Platform in Overhaul Shops

CONVEYOR platforms for assembling machinery are associated in the public mind principally with Henry Ford. Visitors to his works have always been greatly impressed with the speed with which the various operations are performed upon motor cars being assembled as they pass different groups of workmen until the completed "flivver" is delivered at the outer end of the conveyor.

As yet the same principle has not been adapted to electric car manufacture or overhaul by any company in this country. Perhaps the nearest approach is the plan followed in the new B.-M.T. shops, known sometimes as the ladder form of layout. Here the trucks to be overhauled are dismantled as they pass down one side of the shop. During this process all parts of the same kind such as armatures, brake rigging, side frames, etc., are taken off every truck at the same place and sent for repairs at right angles to the dismantling track. After the work of repair is finished, the parts are delivered on the opposite side of the shop, where they are put together into a completely overhauled truck and sent out on an assembling track, parallel to the disassembling track but on the other side of the shop.

This principle is also followed in the newly-completed shops of the London Underground Railway at Acton, except that movement in and out of the shop and of the individual parts while being repaired is carried on

This is the issue in July that is devoted essentially to maintenance and construction subjects

Digitized by Google

very largely by conveyor platforms, as in the Henry Ford plants.

It is obvious that such a plan has certain definite advantages as well as disadvantages. The advantages relate primarily to the way in which the work can be systematized and speeded up. The disadvantages seem to center principally in possible disturbances to the system if a repair takes a longer or shorter time than the average, and in complications if the equipment is not pretty well standardized. Theoretically, the progressive system is much better adapted to a manufacturing plant with one kind of output like, say, a Ford chassis, than to an overhaul shop for a railway having several types of cars. The reason for this is that to secure rapid assembly all parts should be interchangeable.

The difficulties in adapting the system to overhaul, however, are not as serious as they might appear at first thought. In fact, the system at Acton was installed only after it had been used with great success for a number of years on an equally large scale in the L.G.O. bus overhaul shops, controlled by the same interests. These shops almost adjoin the Acton shops, and the good results obtained in them were responsible for adoption of the plan at Acton. It may be that electric railway equipment in London is not as well standardized as is bus equipment, but some differences can be cared for without a great amount of trouble. The solution, of course, is to group the equipment either before or after it is overhauled, so as to put through at specified periods, parts which are all of one kind.

Incidentally, it may be said, the Berlin surface lines also use the conveyor platform system for motor overhaul. A fact that favors the use of this plan in Europe is that there overhaul is looked upon as a manufacturing job. The word does not mean simply the repair of defective parts. It means entire dismantling and the cleaning and overhaul of all parts. Undoubtedly the better condition of rolling stock abroad is attributable to this thorough system of overhaul.

Improved Cleaning Methods Attracting Wider Attention

ONLY recently has the attention that its importance warrants been directed toward improving the method of car cleaning and using mechanical equipment for this routine maintenance task. For years cleaning has been done almost entirely with costly hand labor. Improvements in car-cleaning equipment have not kept pace with those made in other phases of maintenance. The old method of using a pail of water and a long-handled brush as the sole equipment is still in vogue on too many properties.

Some of the improved car-cleaning methods include water spray pipes, either stationary or with movable fixtures to direct the spray. Some installations use high pressure water supply, others are arranged to force steam or compressed air out with the water. The spraying of a chemical cleaning solution followed by water to rinse has been tried. With all these a considerable amount of hand rubbing and brushing is necessary.

It is evident that cleaning machines will prove particularly useful. The Pittsburgh Railways has done some pioneer work in developing mechanical car washing machines. Rotating brushes do the scrubbing on the sides of the car. Satisfactory machine cleaning for the ends has not been worked out yet. A number of automatic features make it possible for one man to use this machine and clean cars satisfactorily. The Baltimore & Ohio Railroad has installed one of these machines and reports that four men have washed as many as 104 cars in an eight-hour day and over a period of 67 days averaged 52 cars. In this work two men apply a weak solution of oxalic acid to window glass before cars pass to the washer, and two additional men control the sprays and brushes. It is stated that a saving of $600 monthly resulted from use of the machine method of cleaning and cars have a better appearance than previously.

Interior cleaning of cars and their furnishings presents an even greater problem than the exterior. Since vacuum cleaners have come into such general use in homes, they naturally are suggested as one means. Domestic types are of too fragile construction to withstand rough carhouse usage. The heavier stationary commercial types require a special cleaning room and are not favored generally. There is an active demand for a rugged portable type of vacuum cleaner equipped with a 600-volt motor so that shop voltage can be used.

The Field for Tools and Parts Among the Electric Railways

TOOLS and shop equipment have a more important rôle to play in electric railway work than ever before. Cars must be kept in condition at all times and the 8,500 buses now used by the electric railways require an amount of maintenance even greater than do the cars. Both cars and buses cost too much to be permitted to remain out of service for any length of time. This is realized more forcefully than ever before among operating men and shop forces as an axiom.

While the electric railways have come to recognize that there is a need for greater dispatch in correcting defects, it does appear that some manufacturers have not yet sensed the real extent of the field open to them among the electric railways. This seems to be especially true among the makers of automotive shop equipment. Theirs is a gigantic industry which seems to know no limits of expansion, but it does appear that these very makers have not taken full account of the automotive expansion among the electric railways. Adequate maintenance at a minimum cost can be secured only by using modern maintenance facilities. And that presumes, of course, an alignment of tools and facilities to prevent waste in man-hours.

Right here it would seem to be desirable to reiterate that while only a few automotive devices have been designed primarily for use in railway shops, some of the tools in general use in garages are none the less applicable to bus repair although many of the tools designed for automotive maintenance are too light for the heavy-duty requirements of buses. Tools of sturdier construction than some now improvised for duty by the electric railways are needed.

No other place perhaps affords a better opportunity for the favorable consideration and acceptance of equipment of this kind than its display at the coming convention in Cleveland. There it is possible to attract the attention of practically the entire industry. But it is essential that the exhibit be made to do its part. In the past some manufacturers have taken space, but after the show they have, like the Arab, folded their tents and silently stolen away. That, of course, is not the thing

Digitized by Google

to do. An exhibit is no less in need of reiteration than is an advertisement. It is one thing to attract attention by doing something spectacular, but to hold attention it is necessary to keep everlastingly at it. So it is with this matter of shop tools and equipment. The manufacturer needs to come in and then come in again and again.

The exhibit along these lines in Cleveland ought this year to be the best ever held. It will be that only if the manufacturers of tools and equipment fully realize the need for reiteration. The manufacturer who properly senses the magnitude of the growing market among the electric railways for a large variety of tools for both car and bus maintenance cannot carry the pitcher of his desire to the well too often.

A Better Era for the Shopman in Cincinnati

IN BUILDING its new Winton shops the Cincinnati Street Railway has assuredly taken a step in the right direction. In equipping them with new tools and machinery throughout, in going just a little farther than the law requires in the installation of safety devices, in providing an abundance of light, and clean, sanitary surroundings for its mechanical forces the company has made an investment that is well worth while. The new shops would be a revelation to many mechanics of a generation ago, who often labored in extreme discomfort amid surroundings that were, to say the least, depressing. Unfortunately such conditions have not disappeared entirely. However, a number of other progressive railways, such as the Toronto Transportation Commission, the Brooklyn-Manhattan Transit Corporation, the Hamilton Street Railway and some others, have revolutionized their shops and created a better era from the shopman's standpoint. This has been done not alone for humanitarian reasons but because the policy has been proved to pay in dollars and cents spent in maintenance work and in the revenue that is obtained from better and more reliable service.

Even after deciding on the construction of the new buildings a quite natural thing would have been to move much of the old equipment from the Chester Park shops, now abandoned. The Cincinnati management, determined to go all the way in its program of modernization, would have none of this, and the result is a credit alike to the company and the city which it serves. Impressive as the expenditure for the new shops may appear, it will be more than justified in the results that are sure to follow. The workingmen employed in the shops will not be slow to respond to the influence of new surroundings and new tools. The result will be better workmanship, lower maintenance costs, a more satisfied train force, fewer breakdowns on the road. This will be reflected in better earnings. Better earnings will ultimately be passed on and translated into better service for the citizens of Cincinnati, where a service-at-cost franchise is operative.

Thus, as the result of this progressive step on the part of the company, there will follow a succession of benefits in which not only the company and its employees but the entire community will share. It is unfortunate, indeed, that more city and interurban properties are either unable, for financial reasons, or indisposed on account of other considerations, to embark upon a similar program. It would do much to raise the industry in the estimation of its own employees and re-establish its prestige in the eyes of the public.

Reorganization of Standards Body Promises Well

EXPERIENCE during the ten years since the American Engineering Standards Committee was established has developed a number of fundamental difficulties inherent in its organization. As a result, there now has been submitted to the member bodies for consideration a revised constitution, differing from the old in two important respects.

The first change is the separation of the functions into: (1) Administrative and financial, which have been placed in the hands of a small board of directors; (2) approval of standards and questions of procedure, which have been placed in the hands of the present "main committee," renamed the "standards council." This separation of functions was deemed desirable to facilitate and expedite the transaction of the several classes of business.

The board of directors, which is a modification of the present executive committee, is to consist of the president, the junior past-president and the vice-president of the standards council, together with nine directors, three appointed each year, one each from three member bodies, nominated and chosen by the standards council and the board of directors. The appointment of a director is entirely in the hands of the member body from which he comes, but it is, of course, essential to the success of the plan that these men be of the executive type, experience and standing. The "standards council" differs from the present "main committee" only in name and in the fact that its duties are restricted to the approval of standards and questions of procedure. As heretofore, the association makes no standards itself, merely passing upon the question as to whether the proper procedure has been followed to warrant granting to a submitted project the designation "American." The individual members are appointed or nominated by the member bodies, which thus remain the basic units of the organization.

The second important change is the adoption of the name "American Standards Association." It was found that the designation "committee" seriously hampered the financial and educational campaigns by its implication that the body was a subordinate organization. The designation "engineering" was objectionable to the architects and certain other groups vitally concerned in the work being done. These difficulties have been eliminated in the new name. Moreover, it gives a balanced, pronounceable combination of initials, A.S.A., which has a decided advantage in practical use.

Revision of the constitution was first suggested by the rules committee of five members. It was referred to and studied for nearly two years by an enlarged committee of nineteen representing every interested group. Finally, it was considered by the main committee. In each instance the change received unanimous approval. The matter will now go before the American Electric Railway Association for approval by the executive committee of the Engineering Association. In view of the increased usefulness which may be expected of the standards body under its new organization, it appears probable that the changes will be accepted and approved.

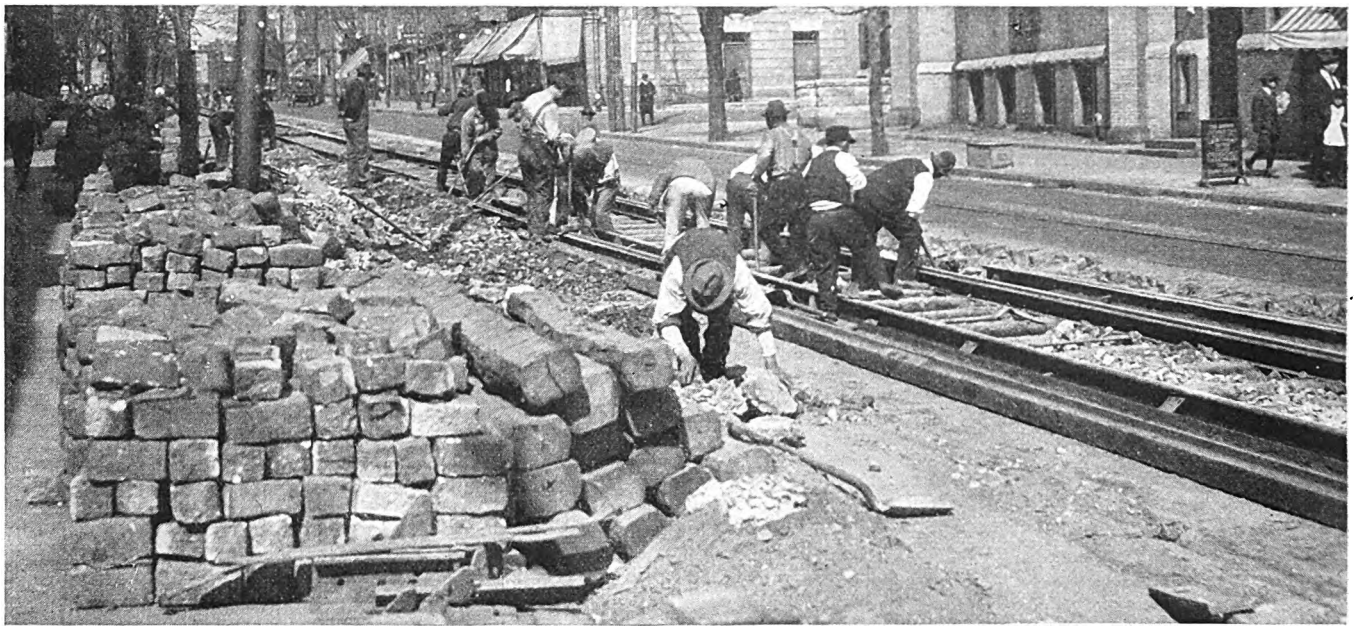
Maintaining Roadway

on a Large System

All work of the Public Service maintenance-of-way department is highly systematized and standardized. Materials are stored in large quantities at a central storage yard

By Martin White
Superintendent Maintenance-of-Way
Public Service Co-ordinated Transport, Newark, N. J.



Preliminary work in preparing a roadbed. Paving blocks have been removed and concrete is now being broken

KEEPING the roadway in a first-class operating condition is the part played by the maintenance-of-way department of the Public Service Co-ordinated Transport, Newark, N. J., in the task of providing safe, proper and adequate transportation for the public. The roadway has a total length of 878 single-track miles on city streets, highways and private rights-of-way, used by trolley cars, and 900 miles over highways for the operation of buses. The territory reaches from Mahwah on the north to Bivalve on the south, and comprises some 275 municipalities in the state of New Jersey. On this roadway are more than 350 bridges, ranging from small culverts to huge timber and steel bridges spanning railroads and rivers, and including an elevated structure in Jersey City and a subway into the Public Service Terminal in Newark.

In the past, many types of rail and paving were used on the roadway. There has been developed, out of the experience with the many types, a type of track construction of high standard. The type installed in the streets by the company is based on the idea that the most efficient trackway, with respect to utility, elimination of noise, maintenance of equipment and satisfaction to the car rider, is one laid on a resilient foundation. All of the tracks are laid on crushed-stone ballast on a well compacted subgrade. Chestnut, oak and creosoted ties are placed on this foundation, and are well tamped by hand and machine tie tampers. On these ties are laid 7-in. 101-lb. steel tram rails, with electrically-welded joints. Spikes $5\frac{1}{2}$ in. long by $\frac{9}{16}$ in. square fasten the rails to the ties, while tierods at regular intervals join the rails.

Track on private right-of-way, where no pavement is required, is substantially the same as that laid in streets, differing only in that 5-in. 80-lb. A.S.C.E. T-rail is used in place of 7-in. tram rail.

Special trackwork at crossings, street intersections and connections with other lines has a shorter life than straight track. Maintenance at these locations is important in order that derailments and possible accidents and delay to traffic be prevented. Construction at these points consists of hard center steel and manganese steel, laid on the same foundation as for track. A history of each piece that makes the complete special work layout is kept; the date of purchase, cost, location, date of installation, and dimensions. This detailed knowledge of the exact age of special trackwork aids in getting out of

Digitized by Google

it the full measure of useful life. Standardized dimensions for special pieces have been in use for many years and enable the speedy interchange of parts whenever required.

Little Inconvenience Caused by Track Work

Track work is conducted to cause the least inconvenience to car service and regular street traffic. Because of the congestion existing on most streets, only one-half of a street is closed for repair work. Crossovers are installed at each end of the section to be improved and car traffic is routed over one track temporarily. The track gang follows the installation of the crossovers by removing the paving and rail. The electric shovel then removes the old ties and ballast, and excavates to the proper depth.

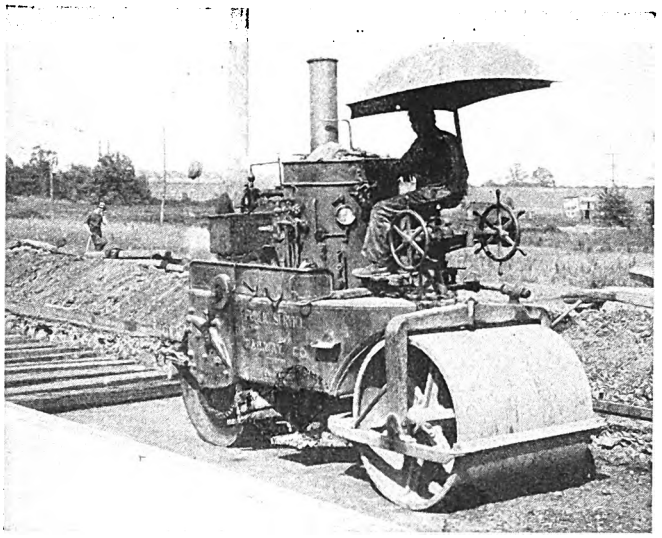
Trucks follow the shovel and load the waste materials which are removed. After the shovel is through the subgrade is thoroughly rolled with a road roller, ballast is installed, ties are laid at standard intervals and rails spiked. Tierods are installed at 7-ft. intervals, joints connecting the rail ends are welded by a special crew maintained for that purpose, the track is lined and surfaced to the proper grade and is then ready for paving.

On sections where the company is required to pave the track, concrete is used as a foundation. The sand, stone and cement are hauled from the main storage yard to the job and piled where the least rehandling of materials will be necessary. After the concrete has been poured and allowed to set, traffic is permitted on the track, the crossovers are removed and a new section of the job is started.

The paving installed by the maintenance-of-way department is a reclipped granite block laid with asphaltic joints. Reclipping the old granite blocks has been practiced by the department since 1904. The clipped blocks are laid on a 1-in. to 1½-in. sand cushion, with close joints, and are well rammed. An asphalt and sand mixture is poured in the interstices between blocks.

Storage Yard Is Accessible for All Shipments

Passaic Wharf storage yard on Lincoln Highway, at the Passaic River, Newark, is the receiving point for shipments of rail, sand, stone, special trackwork, lumber and all other materials. The wharf is easily accessible for freight by railroads, shipments by water, trucks and



Subgrades are thoroughly compacted with a steam roller

the electric cars of the company. Stationary car and auto cranes unload and store the heavy materials and in turn load them for shipment out of the yard by work cars, derrick cars or auto trucks to central storage yards in the various divisions and to each particular job under construction. Rehandling of materials is eliminated by hauling only such materials as are needed to keep the work moving.

The storekeeper at the storage yard is notified when work is to start, and a bill of materials is sent him for his guidance. Arrangements are made for materials to be sent when required, and the equipment to be used is made ready so that it can be obtained whenever needed. The divisional storage yards are used mainly for storage of materials required in making repairs to the property.

The equipment owned and operated by the department is very complete. Electric shovels mounted on caterpillar trucks, gas and electric concrete mixers, locomotive and truck mounted cranes, air compressors mounted on trucks and miscellaneous tar kettles form the mobile equipment stored at Passaic Wharf and available for service in all divisions. A fleet of dump trucks is also part of the wharf's equipment. Each division has its

Digitized by Google

Unloading a sand barge with a stationary crane at the wharf along the Passaic River

individual equipment, consisting of welding machines, electric track drills, electric grinders, acetylene cutting apparatus and dump trucks.

Welding Is an Important Activity

The welding of track joints and repairs to special trackwork comprise a very important activity performed by the department. Twenty-six welding machines of various types are used, ranging from the light one-man resistance welder to the heavy motor-generator mounted on trucks. Both carbon and metallic arc welds are installed, but metallic arc welds are used most. Fully 3,000 welds are made yearly. Welding has thus far been confined to track work, but it is planned to weld bridges.

Maintenance and upkeep of bridges is under a supervisor of bridges employing a large force of men. An adequate record is kept of the number and type of structures over which the railway runs. The safety and regularity of service depend on careful attention to the maintenance of bridges. Thorough and periodical inspection, followed by necessary repairs, are made during the year. Posts, floor beams and stringers are carefully gone over for flaws, cracks and defects in the steel work. Members are tested for loose rivets. Tiers, abutments and culverts are examined for undermining, bulging, cracking and settling, or other defects that would cause weakness.

Timber bridges are checked to determine whether there

Digitized by Google

is any decay in the materials and if the trestle bents are plumb, sills and caps are level and if the guard logs and stringers are rigidly fastened and safe. Painting of the bridges is also inspected, and, where needed, bridges are carefully cleaned of rust, scale and dirt, and painted with a first-grade paint to preserve and protect the steel work.

Scope of the Department's Activities

Under the organization plan of Public Service Coordinated Transport, the maintenance-of-way department, under its superintendent, is in charge of track, roadway and bridges. Studies, estimates and plans are made for the reconstruction projects as well as for the ordinary maintenance repairs that are found necessary to keep the property at its maximum efficiency. Acting under a division manager in each of the six divisions of the company are the supervising officials who have immediate charge of all phases of work.

The preparation of estimates for annual work is in some cases started several years in advance. They are based on recommendations of the division managers, requests of public officials and inspection by the department. From these estimates the annual budget is made for approval of the higher officials of the company. Twenty to thirty miles of track are reconstructed each year at a cost of about $1,000,000.

Estimates, cost reports and distribution reports are made periodically. The estimates show detailed cost of new construction and original cost of work to be replaced. Authorization for individual jobs is based on these estimates. Cost reports show the actual cost of the finished job and mark the closing up of an authorization. Daily reports are made on causes of derailment, distribution of laborers and operating expense. This latter item is also posted on charts and shows the cost of work by divisions. Weekly reports are made of work on projects being done under authorization.

In addition to inspection of bridges, noted before, the track condition and roadway are also inspected periodically. Materials used by the department are inspected by the company's inspectors, as well as by a firm of inspecting engineers, in an effort to have only the most suitable items enter into the railway's construction.

The maintenance-of-way department maintains contact with the engineering departments of the state, counties and municipalities. Work is planned to the mutual benefit of both parties concerned and difficulties that arise are quickly settled.

T. H., I. & E. Adds Another Locomotive

FREIGHT business on the eastern division of the Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., grew to such an extent that it was necessary to secure another locomotive. Plans were immediately made for construction and the new locomotive was soon in process.

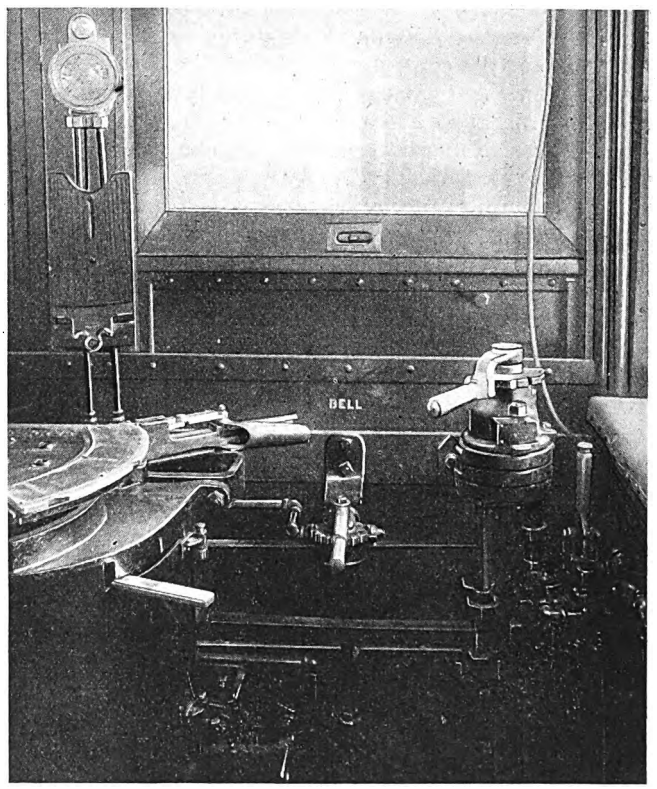
The locomotive was built especially for through service, having a total weight of 45 tons and an approximate pulling power, on level track, of 700 to 725 tons. With the exception of a wooden floor laid over a steel floor inside the cab, the entire locomotive is built of steel.

The underframe consists of four intermediate sills of 10-in. I beams 35 ft. long, and two outside sills of 10-in. channels, also 35 ft. long. The curved ends of the underframe were also made of 10-in. channel beams. The floor is of ¼-in. steel under the cab, and ¼-in. diamond plate on both ends outside of the cab.

The cab, which measures 18 ft. by 9 ft. 3 in., was constructed of 3-in. steel angles for posts with siding of No. 12 gage sheet steel. The roof is of No. 16 gage sheet steel supported by seven carlines. Four coats of air-drying weatherproof insulating varnish and granulated cork were given the inside of the roof to protect it against condensation and to deaden the sound. The interior control compartment within the main cab is 8 ft. by 5 ft. 3 in., and is inclosed by ¾-in. mesh wire cloth.

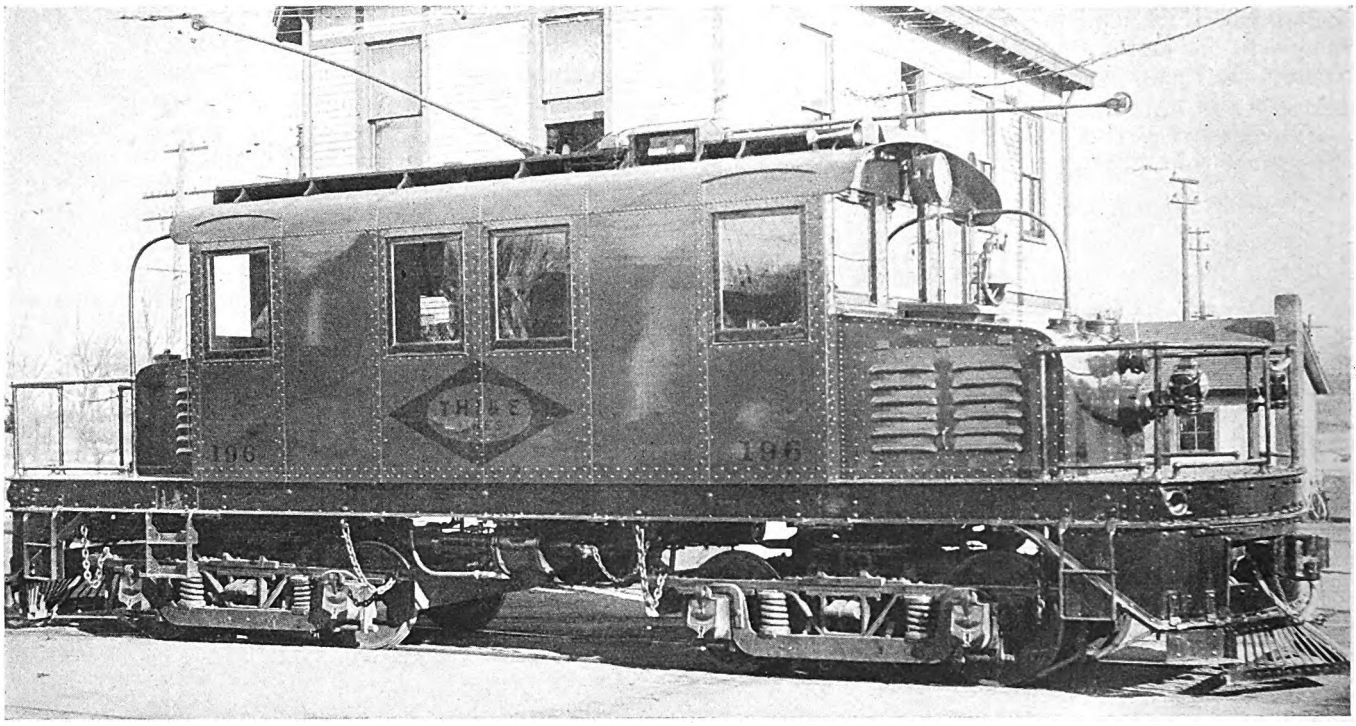
Truck centers of the locomotive are 17 ft. 8 in. The trucks are of the Baldwin 78-35 type, rebuilt throughout to take care of the extra weight to be carried. Brake hangers were designed to get clearance between the trucks. The air brake equipment is the Westinghouse AMM type.

Four Westinghouse No. 121, 100-hp. motors were used. For cooling the motors there was installed a style 33-SK electric motor blower with a rating of 5½ hp. at 1,375 r.p.m., a maximum speed of 2,000 r.p.m., and capable of supplying 3,000 cu.ft. of air per minute to the motors. The other electrical equipment, all Westinghouse, includes twelve style 480 switches; two heavy-duty locomotive line switches, style UP-162; a reverser, type 284-L-7, especially designed for locomotive service; and style 337 master controllers. The controllers are operated by electro-pneumatic switches. Two trolley bases and poles were mounted on the cab. They have separate fuses and switches so that both trolley bases



Master controllers, sander and brake valves are conveniently located for the engineer

Digitized by Google



"Pride of the Eastern," the all-steel locomotive recently completed for the Terre Haute, Indianapolis & Eastern Traction Company

cannot be alive at the same time. This arrangement is to protect crews from possible shock in taking hold of a pole when it is tied down and not in use.

Current for the control circuit is supplied by a 32-volt battery. The battery circuit is connected to the line through a resistance, and if the battery fails while the car is in motion the line current operates the control. The switch group is a standard AB with type 480 switches, with all but four interlocks removed. Current to the control circuit from the master controllers must pass through the reverser, making it impossible to get current to the switches unless the reverser is making full contact. The overload trip is wired to drop all switches in case of overload in the main circuit.

A single-pole knife switch is installed for disconnecting the line voltage when it becomes necessary to enter the control compartment or to repair any of the electrical equipment. Disconecting the main line leaves only the 32-volt battery to operate the switches and lights. For night repair eight lamps can be connected to the battery circuit by a relay. The relay is in series with five 56-watt, 130-volt lamps, and the line circuit. When the main circuit opens, the relay drops and connects the 32-volt lighting circuit. Two lamps are in the main cab, two in the control compartment, one on each fuse box on top of the car, and two on the running board. The two on the running board give a flood of light to the trolley wire, making it easy to locate the wire when the trolley jumps off.

Care was taken to mount the apparatus on the locomotive so that all parts would be accessible for inspection and maintenance. All main circuit control equipment, including the grid resistors was mounted in the control compartment of the cab, leaving ample aisle space along each side of the cab and sufficient room for the locomotive engineer at each end. Master controllers, air brake and sander valves were located conveniently for the engineer.

Mechanical parts of the locomotive were designed by C. W. Duncan, master mechanic at the Greenfield, Ind., shops of the company; the electrical connections were designed by A. B. Duncan, also connected with the company.

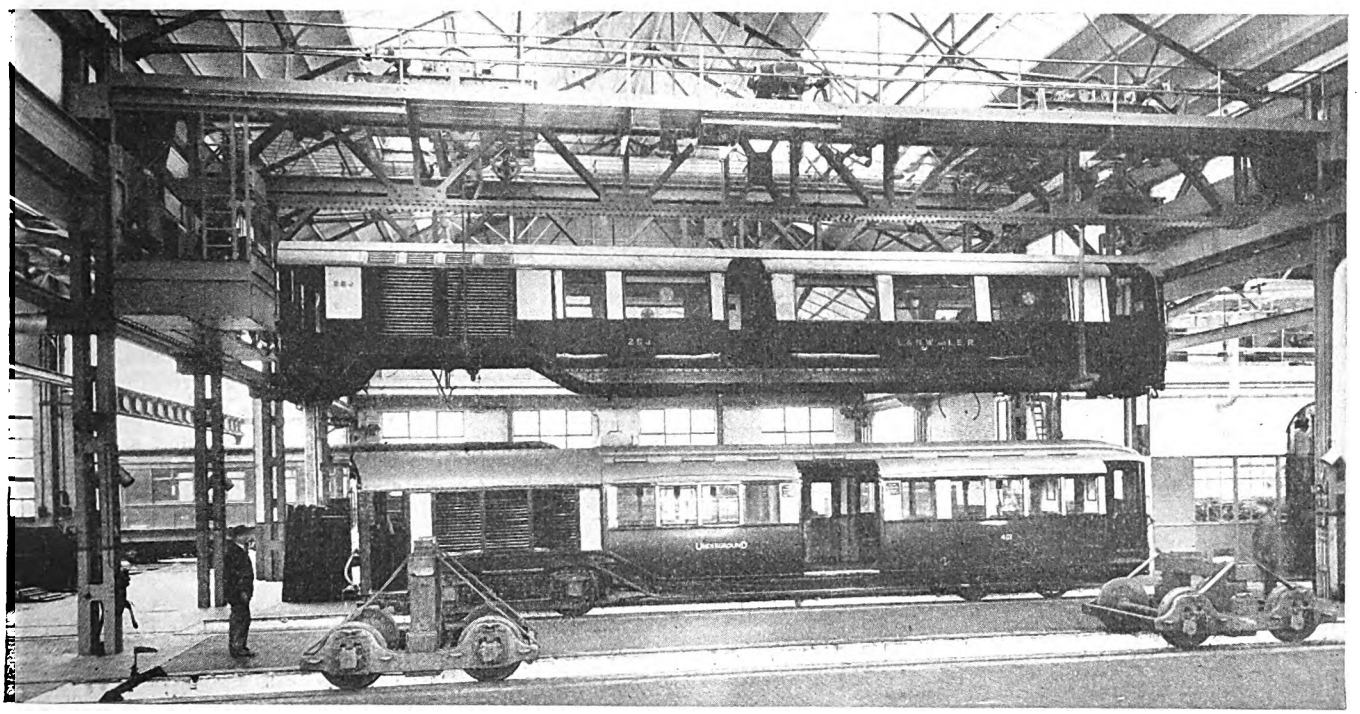
Overhaul by Conveyor Platform

Shops for the overhaul of the rapid transit cars of the London Underground Electric Railways have been completed. A feature is the extended use of conveyor platforms by which overhaul is done progressively as the cars pass through the shops



At the beginning of overhaul. The car body is lifted off its trucks and sent to the body shop on dummy trucks. The service trucks are sent to the equipment overhaul shop

SHOPS of the London Underground Electric Railways at Acton, in the west of London, recently completed, are among the largest in the world. A feature which makes them of even greater interest is the extensive use in them of the conveyor system of car repair. An extended article on the initial plans on this installation was published in ELECTRIC RAILWAY JOURNAL for Aug. 20, 1927. At that time the work of reconstructing these shops for the conveyor system was under way. This method had been used for a number of years in the adjoining shops of the London General Omnibus Company and proved so satisfactory that it was adopted for the electric railway shops at Acton. It is now possible to give views of the completed plant for railway equipment.

The present schedule of these shops calls for the overhaul of 1,406 cars per year, out of a total rolling stock of approximately 2,100 cars. The average service mileage between overhauls is 60,000 for motor cars and 75,000 for trailers. The shops have a capacity for overhaul of 40 cars per week, and at present employ 845 men and 35 women. The area occupied by the main building, accommodating the truck shop, body shop and paint shop, measures 400x375 ft.

In the paint shop and certain other places where disintegration of the unit is not involved, the car body is hauled about on shop trucks, known as "accommodation trucks," by means of electrically-driven endless chains, movement being continuous.

LIFTING SHOPS

The first shop entered by cars to be overhauled is known as the lifting shop. Here the body is raised from the trucks by a 65-ft. span, 30-ton duplex crane of special design, as illustrated. The two grabs are arranged so that they can be used independently or coupled together. When coupled they are controlled from one handle, and the lifting speeds are synchronized regardless of any variations in the load distribution. Here the trucks are run out from under the cars and are taken to the truck shop. Then the body is placed on especially high shop trucks, as shown in the view above. These trucks enable the body to be kept mobile and carried at a height convenient for the men who have to work beneath it.

If only casual repairs are required to the car body, they are undertaken in the lifting shop, as a matter of convenience and to avoid duplication of heavy lifting equipment.

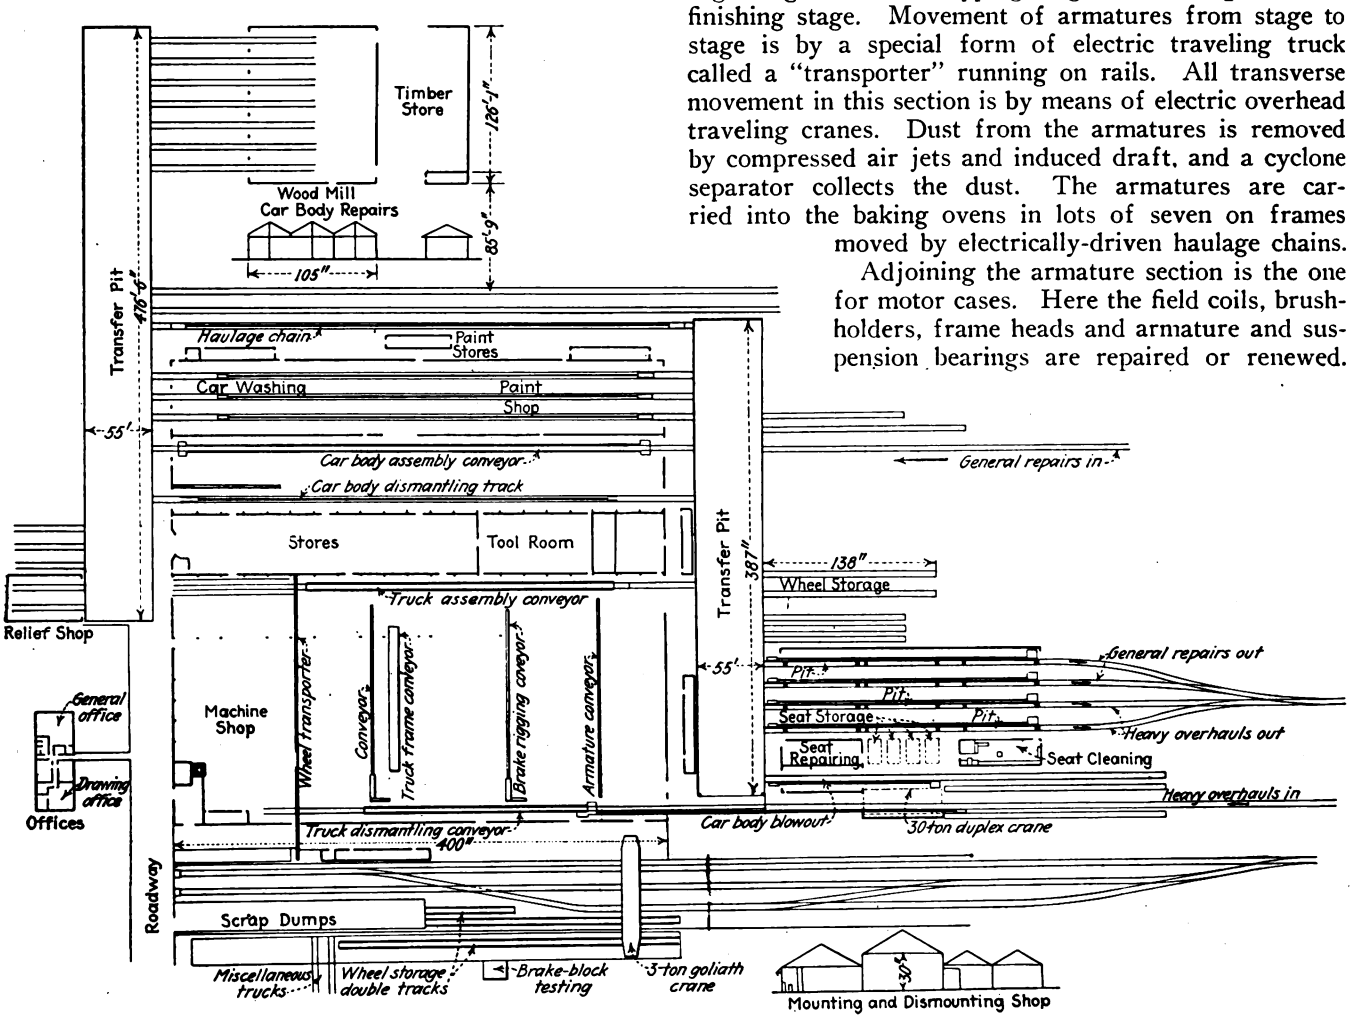
At this stage all seat cushions and upholstery are removed from the car body and pass to the adjacent seat cleaning and repair section. The machine used for cleaning these car seats is illustrated.

Digitized by Google

The car body is then drawn by an endless chain into a blowing-out room, where dust and dirt are removed from the electrical equipment and car underframe. This work is accomplished by induced draft connections underneath the car. At the same time compressed air jets are used to break up the dust.

If the car body requires general overhaul or painting, after being blown out, it is sent to the body shop and later to the paint shop, as will be mentioned later. This article will deal with the repair of the truck first.

The truck shop comprises six sections, devoted respectively to the repair of armatures, motor cases, suspension and brake gear, truck frames, journal boxes, wheels and axles.



Simplified plan of Acton shops of London Underground Electric Railways. These shops conduct overhaul by the progressive system

The entire shop is equipped with two electrically-operated conveyors, both on the level of the main floor. One of these is for dismantling and the other for assembling the trucks. They run lengthwise, but in opposite directions and on opposite sides of the shop. Between is a series of smaller conveyors at right angles to them, so that the arrangement is something like that of a ladder lying horizontally.

The general appearance of each of these main conveyors is the same. It can be understood from the interior view of the shop, showing the assembling conveyor. These conveyors travel at the rate of 7 in. per minute.

When a truck enters the overhaul shop on the dismantling conveyor, parts of it are successively removed by electric traveling cranes, until when the end of the shop is reached, nothing is left of the truck but the axles and wheels. These are removed from the conveyor by crane to go to the axle and wheel section, which is the section between the cross rungs of the ladder farthest from the point where the truck entered the shop.

After being lifted from the dismantling conveyor each part travels at right angles to its former direction until, after being repaired, it reaches the assembling conveyor.

The first of the six repair sections mentioned is that where the armatures are reconditioned and, if necessary, are completely rebuilt or rewound. In this department armatures pass from stage to stage along the section beginning with the stripping stage and ending with the finishing stage. Movement of armatures from stage to stage is by a special form of electric traveling truck called a "transporter" running on rails. All transverse movement in this section is by means of electric overhead traveling cranes. Dust from the armatures is removed by compressed air jets and induced draft, and a cyclone separator collects the dust. The armatures are carried into the baking ovens in lots of seven on frames moved by electrically-driven haulage chains.

Adjoining the armature section is the one for motor cases. Here the field coils, brushholders, frame heads and armature and suspension bearings are repaired or renewed. The frame heads and bearings are washed, the motor cases are blown out, bearings are cast, field coils are wound and other work done, all in the order of sequence of operations on the motor case.

In an adjoining section the brake rigging is being repaired. All parts, before being examined for repair, are passed through a washing machine located in this section. Their movement through this machine is automatic because they pass through it on a moving chain grate at a speed of 26 in. per minute. A view of this washing machine appears about at the middle of the illustration showing the truck dismantling conveyor. As the parts emerge from the washing machine, they are inspected and marked with distinguishing colors to indi-

magnetic device for detecting flaws in the axles, as shown in one of the accompanying illustrations. All axles pass over it when leaving the dismantling conveyor. This magnetic flaw-detecting device is fitted with a compressed air lifting mechanism to raise the wheels off the rail while they are being tested. A pneumatic tire riveting machine used in this section is illustrated.

Progressive Movement in Body Shop Also

The body shop is similar in general arrangement to the truck shop, there being a dismantling row on one side and an assembling row on the other side, with repair sections placed in sequence of operation between these two rows. In the dismantling row, the car bodies are moved along their track by an electrically-driven endless chain, the speed of which is 10 in. per minute. As already explained, the cars travel on accommodation trucks, one of which can be connected to the endless chain by a dog. This dog can be released by a single movement of the lever to stop the car, and it can be connected as quickly.

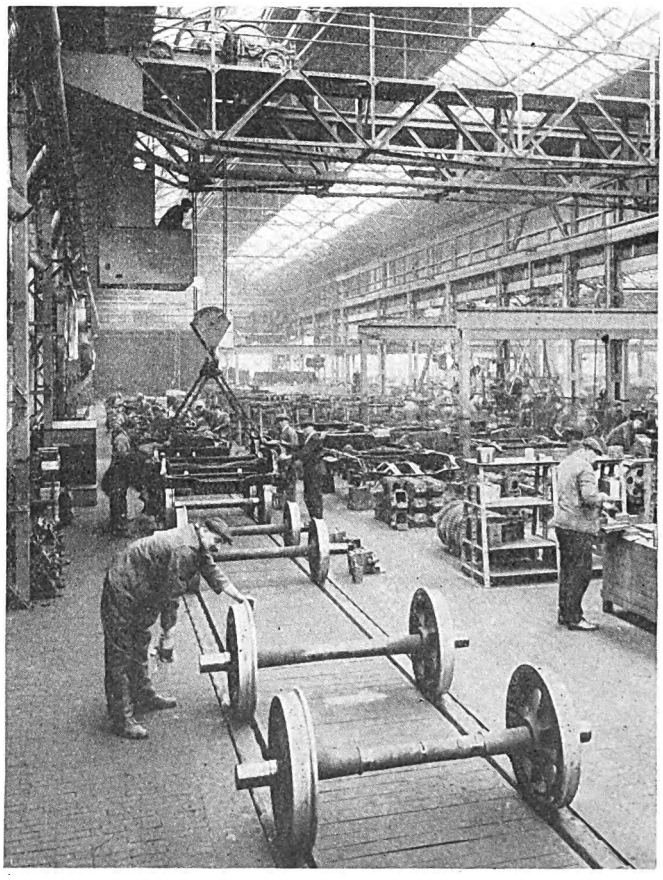
The assembling row in the body shop differs from the dismantling row in the same shop in that it consists of moving track with the floor between the rails moving with it. The rate of travel is 10 in. per minute. The purpose of this kind of a conveyor in the body shop is to keep the wheels of the trucks from revolving. Thus, work can be carried on underneath the car more easily than with the simpler system of chain haul and a fixed floor, used elsewhere in the body shop.

As cars enter the body shop they are subjected to a high-tension test to detect any defects in their electrical circuits. This work is carried out in a railed-off inclosure before the car is attached to the dismantling row chain.

The first cross-section in the body shop is known as the compressor section. Here the compressors are removed from the cars by two overhead electric cranes and are placed on small wheeled platforms running on a framework bench. The work of overhaul is carried on as the platform moves from one end to the other of this bench. In the last position, air and electrical connections are made to give the compressor a running test. The finished compressor is then stored near the assembling conveyor, ready to be placed on the car as it passes along the assembling row. The empty platforms return to the receiving end by gravity on rails underneath the bench.

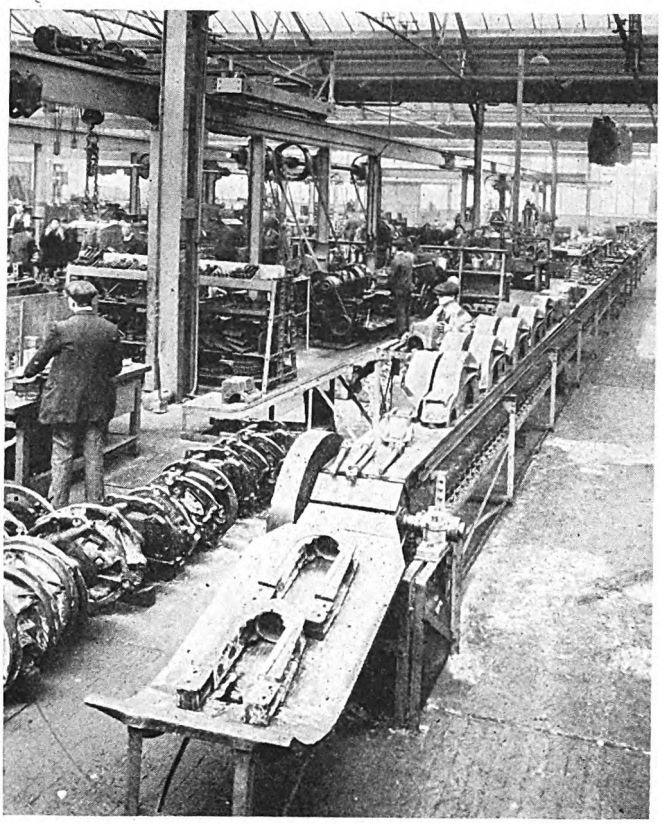
The next section is devoted to the electrical equipment. This section has storage racks on the dismantling side to receive the various items of equipment as they are taken from the cars, repair benches in the center, and storage bins on the assembling conveyor side to receive the overhauled unit. Each bench has an electric motor mounted on a swiveling pedestal and driving a flexible shaft, to which can be attached various labor-saving tools.

The next section deals with the overhaul of drawbar gear and foundation brake rigging. The parts are first passed through a washing plant similar in design to those used in the truck shop. This section is also equipped

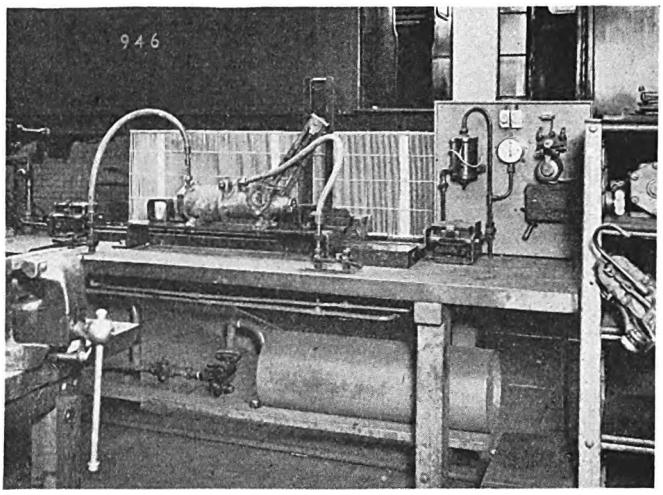


The truck is assembled on this conveyor, beginning with the wheels in the foreground. This conveyor travels at a speed of 7 in. per minute and what looks like rails in the picture are really part of the conveyor

Digitized by Google



This is another typical cross-shop conveyor. It is known as the material conveyor



Door engines are tested on benches like this

with an electric spot-welding plant, two gas forges, a gas-annealing oven, a 2½-ton pneumatic hammer and the requisite machine tools to render it self-contained.

The next section is devoted to brake valves and air door engines. The parts to be overhauled are passed through a washing plant and are then distributed to the appropriate repair benches by means of a continuously moving conveyor. The smaller parts are carried on this conveyor in containers. The benches are arranged in pairs with a gravity roller-way between each pair. When a container arrives opposite the bench dealing with the items it carries, it is automatically diverted from the conveyor on to the roller-way. After overhaul, the various units are tested on test benches arranged on the assembling conveyor side. A view is shown of the air door-engine testing bench. The containers after being emptied, pass to a gravity roller-way underneath the bench, thus automatically returning to the bottom side of the conveyor, which carries them back to the washing plant.

The paint shop is equipped with three tracks, each with an electrically-driven endless chain just outside one of the rails. This chain moves in a conduit under the floor but connection can be made to it through a slot when cars have to be moved.

Two tracks in the paint shop are devoted to touching up and varnishing. Here the work is done under movement, the car moving forward continuously at a speed of 3 in. per minute. The third track is set apart for re-

The wood shop for body repairs of a heavy nature. Accommodation is provided for seven cars

Digitized by Google

painting. Here the movement is intermittent, the cars being moved at fixed intervals by means of a chain which runs at 30 ft. per minute.

Obviously, not all work can be done with the cars under movement. This is recognized in the wood shop, a view of which is published. This shop deals with repairs to car bodies, which are of a heavy nature. It is fully equipped with wood-working machinery and supplies unit parts to the other shops. Accommodation is provided in this shop for seven cars. Approximately 4 per cent of the total number of cars passing through the works enter this shop.

Hot air heating is used throughout in all the shops. There are five heaters which are adjusted to maintain steam to provide an even temperature of about 55 deg. F. in all parts except in the paint shop, where a temperature of about 65 deg. F. is maintained.

Heaters Require Maintenance, Too

By George E. Oakley
Consolidated Car Heating Company, Albany, N. Y.

ELECTRIC heaters require little maintenance, and undoubtedly receive less attention on inspection and overhauling of the cars than they should. This lack of attention in connection with their maintenance is probably due to the small amount of trouble experienced with this part of the car equipment. However, there are reports of cold cars, over-heated seats, and occasionally of short circuits.

The best time to begin heater maintenance is when the heaters are installed in the cars, because a good job done then will save a lot of trouble later. In making connections to the heater terminals, care should be taken that the connections are good and tight and that there are no loose strands of wire. If soldered joints are to be made or terminals soldered on wires, they should be clean and well-made, because a large proportion of the troubles in electric circuits start at the connections or joints in the circuit.

After the heater wiring has been completed, but with the heater ground wires disconnected, the heater circuits should be given a high potential breakdown test of from 2,000 to 3,000 volts a.c. in order to detect any weak spot in the wiring which might develop into a ground. Where there are two or more heater circuits, the same breakdown test should be tried between the different circuits in order to detect short circuits. The heaters should now be tried out to see that they all are working. It is a good plan to connect an ammeter in the circuit to see that the heaters are taking the proper current.

At the regular car inspection periods the heater equipment should be inspected as follows: (1) Examine fuse boxes to see that they have the proper capacity fuses, and that the fuse dips are in good condition. (2) Examine the switches to see that contacts, clips and switch handles are all right. (3) If cars are equipped with thermostatic control, examine the magnetic switch to see that it is operating properly and that the contacts are in good condition, and inspect the thermostat to see that it has not been damaged or tampered with. (4) Try out the heaters to see that all circuits and all heaters are working. This can be done by leaving the heat on for a while and then feeling each heater by hand to see that they are all giving off about the same amount of heat.

Whenever it is necessary to replace a heater or a heater coil, care should be taken to see that the proper coils are used and that the heater is reconnected properly in the circuit. As a check on this, it would be well to take voltmeter readings across the new coil or coils after being connected in the circuit. The voltage drop across each coil should be equal to the line voltage divided by the number of coils in the circuit. If the drop across the new coils is more than 5 per cent higher or lower than this normal value something is wrong. This heater should be removed, the coils checked carefully and their cold resistance measured with a bridge. If the heater coil is the wrong one for that particular equipment, it should, of course, be replaced with the correct coil. However, if the coil resistances measure up all right the wire size is correct. The trouble lies in the other heaters in the circuit or else in the wiring or connections. The heater should be put back in the car and connected in circuit, and voltmeter readings then taken across all coils in the circuit. If the voltmeter reading across the coil in question is low, it indicates that the voltage drop across some of the other coils is higher than normal. This may be due to too high a resistance of the coils or to poor connections. If the voltmeter reading across the coil in question is higher than normal, it may be caused by one of the following: (1) Some, or all of the other coils may be too low in resistance. (2) One or more coils may be wholly or partially short circuited. (3) There may be a ground on the heater circuit between the heater in question and the last heater in the circuit.

In making these tests, the voltmeter readings should not be taken until the power has been on long enough to attain a constant value. This is of particular importance with heater coils of iron wire. The temperature coefficient of iron is high and consequently the cold resistance is low. As a result the current is high when the heat is first turned on. As the coil heats up the current gradually decreases and becomes constant when the temperature of the coil becomes constant. Voltmeter readings, if taken too soon are thus liable to be misleading.

If the heater equipment has been maintained properly, about all that must be done in the fall is to blow out the heater cases with compressed air, or vacuum, to remove the dust and dirt which naturally collect. When the cars are overhauled the heater equipment should be put in first-class condition, including heaters, fuse boxes, hand-operated switches, magnetic switches and thermostats.

It is not necessary to remove the heaters, unless they are defective, but it would be well to inspect the terminals and connections and test out the wiring for grounds or short circuits. Ammeter and voltmeter readings of the current and drop across each heater coil should be taken. These tests will show up any defect in the coils or wiring.

For the purpose of ordering repair parts for heaters, and particularly coils, the following data should be on file: (1) Class of car, (2) type and catalogue number of heater as cross-seat, panel, trussplank, vestibule; (3) number of heaters per car, (4) number of coils per heater, (5) number of coils in series across line voltage, (6) cold resistance of heater coil and (7) size of heater coil wire.

In ordering parts other than coils it is sufficient to give information listed under item 2 in addition to a description of the parts wanted. When ordering coils the information under items 2, 3, 5, 6 and 7 should be given. The information listed under items 6 and 7 should be obtained direct from the heater manufacturer, and not by measuring coils in heaters or in stock.

Bearing Practice and Babbitting Facilities*

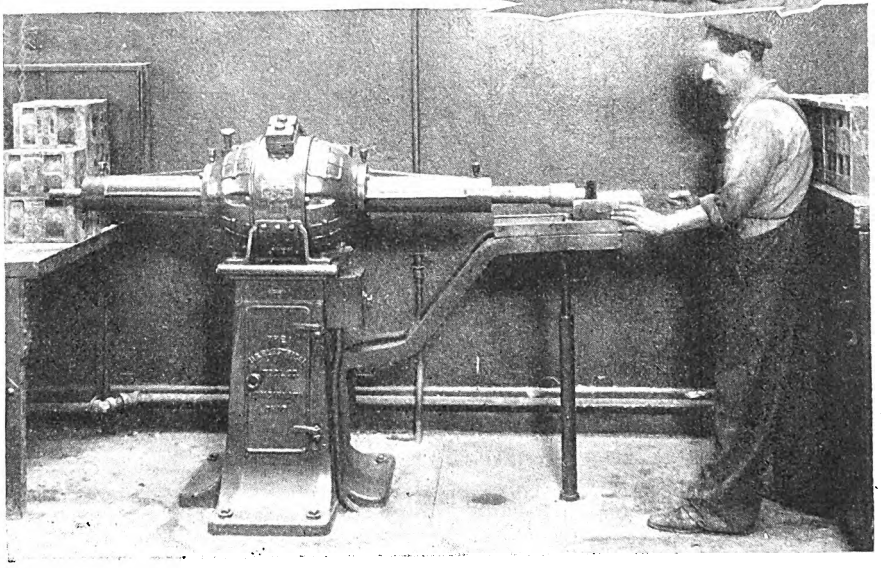
In New B.-M.T. Shops

By *Clarence W. Squier*
Associate Editor ELECTRIC RAILWAY JOURNAL

Riveting check plate in place

PRACTICE on many electric railways is to determine the period between general overhauling of rolling stock by the length of time that bearings can go without renewal or repairs. At one time they were a limiting factor in fixing the overhauling period on the Brooklyn-Manhattan Transit Lines. By use of bronze bearings with a thin lining of babbitt, by fitting each bearing to its axle or shaft, and by use of perfected methods and equipment in the bearing department, overhauling periods have been lengthened until now bearings are no longer a factor. The two-year period between overhaulings of the railway's subway cars is considered as the maximum time that the car bodies should go between paintings in order that they may not present an unattractive appearance, and all equipment is overhauled at that time and put in condition to stay out for another two-year interval.

In arranging and equipping the babbitting department at the new Coney Island shops advantage was taken of the experience gained with the very complete equipment previously located in the railway's East New York elevated repair shop. Before repairs are started bearings are cleaned in chemical cleaning tanks. Excess babbitt is removed by motor-driven wire brushes and mandrels are pressed out with a forcing press. The babbitt pots and drying and preheating furnaces are equipped with Bristol recording pyrometers. All furnaces were supplied by the Mahr Manufacturing Company, Minneapolis, Minn.



Polishing the inside of a journal bearing with a motor driven wire brush

All bearings are gaged carefully on the outside for wear

The babbitting department in the Coney Island shops occupies a floor space of 40x40 ft. Bearings to be repaired are delivered through a doorway in the south side of the room by electric trucks. They are placed in wire baskets and then are handled by a jib crane into cleaning tanks. There are three of these tanks in the department, each 3x3x2 ft. Two have a chemical cleaning solution and the other has water for rinsing. Bearings remain in the cleaning solution for about 1½ hours. After rinsing any grease, scale or dirt that still may remain on the bearings is removed with a wire brush. They then go into an oil-fired drying furnace which is kept at a temperature of about 600 deg. F. Careful cleaning of the bearing shells is considered very important, as effective tinning and babbitting can not be done on dirty material.

From the drying furnace bearings are routed in two

**This is the fifth article on methods and equipment used in the Coney Island shops of the B.-M. T. Corporation. Others were "Truck Overhauling," published April 21, 1928; "Intermediate Truck Repairs," published May 5, 1928; "Wheel, Gear and Axle Maintenance," published May 19, 1928, and "Motor Overhauling," published June 16, 1928.*

Details of truck with locked compartments for transporting bearings

directions. Journal bearings go to a single-pot babbitt furnace on the east side of the room for burning out the old babbitt, while armature and axle bearings go to a similar furnace on the west side of the room for burning out. Babbitt removed from bearings is skimmed of all dross and refuse and then is run into molds so as to place it in convenient form for further use.

From the melting-out pot, journal bearings go to the tinning furnace which has pots containing half-and-half solder. The inside section is swabbed with a flux and a coat of whiting is painted on the outside to keep the tin from sticking where it is not desired. The bearings are then dipped in the solder until they are coated thoroughly. They are left in the pot until they are so hot that the solder will run off readily.

After tinning, bearings are placed in a preheating furnace to keep them hot, ready for babbitting. This furnace is kept at a temperature of from 500 to 600 deg. F. After the babbitting jigs and mandrels are once heated they remain hot from the hot babbitt. Preheating of the jigs and bearings is important, otherwise the babbitt is sluggish in pouring due to the composition of copper and antimony. It is the practice in the Coney Island shops to take bearings from the preheating furnace and dip them in the babbitt pots which are kept at a temperature of 800 deg. F. The bearings are thus at a temperature nearly the same as the babbitt when it is applied.

The babbitt linings are poured with the bearings in a vertical position. Mandrels are made with an allowance of ⅛ in. for boring of the rebabbitted bearing. The thickness of babbitt remaining after machining is about ⅛ in. in armature bearings and 3/32 in. in axle bearings, so a total thickness of about ¼ in. is cast on. Mandrels are dipped in an emulsion of fire clay about every fourth pouring. This prevents sticking of the babbitt to the mandrel as well as blowholes, and gives a very smooth inside finish.

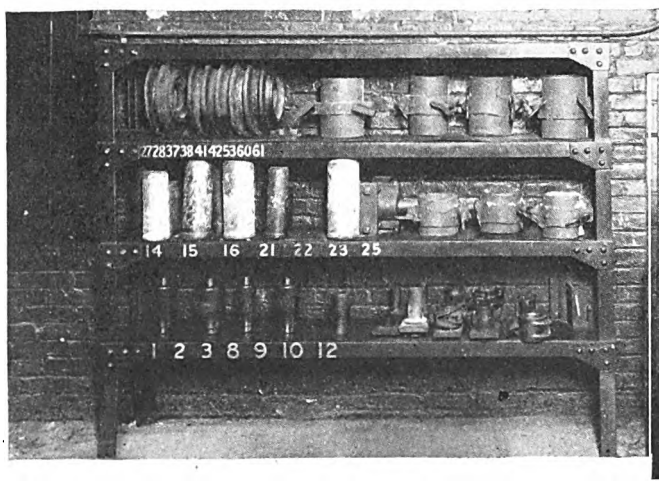
As shown at the left, all mandrels and jigs are stored carefully on shelves provided with numbers so that they can be located quickly. A board on the wall adjacent shows the workman the particular mandrel and jig needed for the babbitting operation

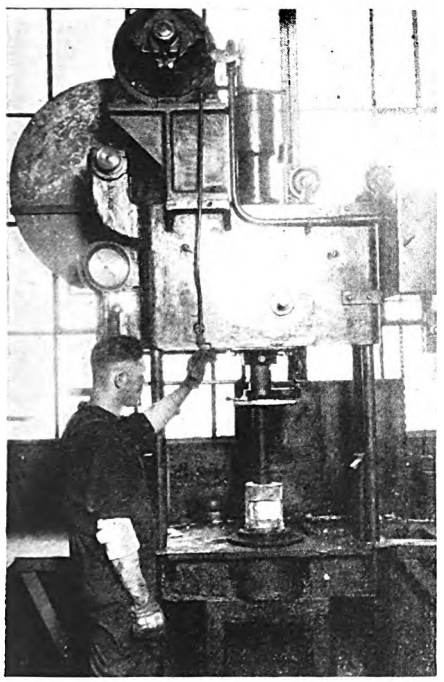
The view below illustrates the removal of babbitt from the windows of armature bearings by means of hot irons



Digitized by Google

The metal used is of a composition commonly known as genuine babbitt. It consists of 83⅓ per cent tin, 8⅓ per cent antimony, and 8⅓ per cent copper. Ladles used are of a self-skimming type with a bridge extending over the front portion and a screen inside extending down from the lip so that the molten metal is taken from near the bottom. The babbitt is mixed thoroughly by agitating the molten metal just previous to filling the ladle. In pouring, the metal is run from the ladle in a steady stream directly down along the mandrel. This avoids splashing and pocketing of air. If the metal is splashed against the mandrel, it will cause blowholes and result in a mushy bearing.

After bearings are babbitted they go to the trimming table where all fins, burrs and excess metals are removed with a hot iron. Chipping of bearings is avoided as it may loosen the babbitt lining. A small oil furnace is used for keeping trimming irons hot. The next operation for journal bearings is that of filing off all lumps and burrs from the bronze shell, using a special soft metal file. The check plates are fastened on with a pneumatic riveter and then they go to a machine where the inside is polished with a motor-driven wire brush. This machine was furnished by the United States Electric Tool Company and is direct driven by a Westinghouse 3-hp., 600-volt motor. Each bearing is fitted to the particular axle or shaft for which it is intended, so the final boring out is done in the truck and motor repair sections of the shop. Armature and axle bearings are bored 0.003 in. to 0.004 in. per inch of diameter larger than the axle or shaft that they fit.

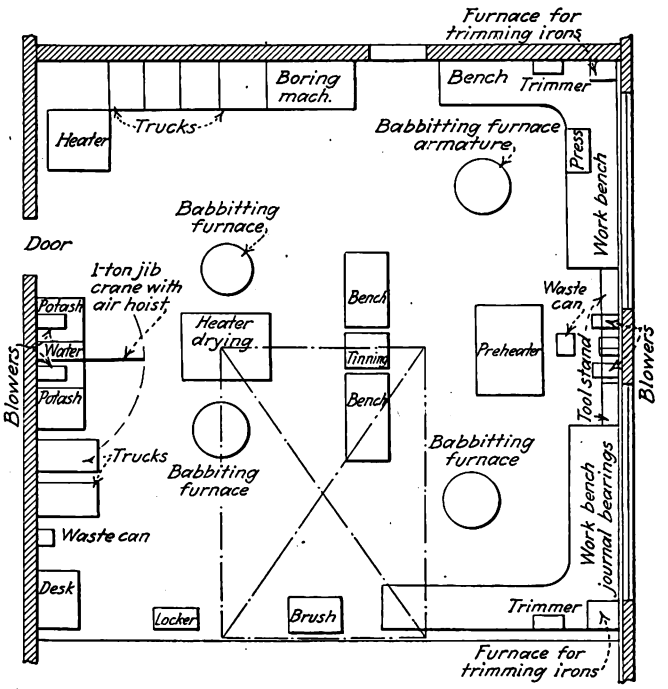


Mandrels are pressed out of armature bearings by a hydraulic press

Armature and axle bearings follow the same procedure in the babbitting room as journal bearings for the cleaning, drying and melting out of the old babbitt. They then are tested carefully with snap gages for wear on the outside of the shells. A maximum of 0.017 in. wear is allowed. These snap gages are kept in a box at the bench. When bearings are received, they are gaged and any over which the snap gages will pass are put aside for scrapping. Tinning and preheating methods are the same for all types of bearings. Axle bearing linings are poured, one half at a time, in the babbitting jig.

A carefully worked-out system for keeping track of babbitting jigs and mandrels is used in the department. Each part is numbered and is placed in a definite location on storage shelves. A large board occupies one side of the room. On this is a tabulation in large figures showing the various mandrels, bases and bands which should be used for each particular type of bearing. An accompanying illustration shows this board. The columns give type of motor; particular type of bearing which is to be babbitted, such as commutator end or pinion end; material which is used for the bearing shell; numbers of the various broaches used; numbers of mandrels, and numbers of bases. Thus, if a commutator end bearing for a GE-248 motor is to be babbitted, the workman uses mandrel No. 14 and base No. 60. This method reduces the number of the various parts and makes it easy for the workman to select the proper fit.

Smoke charts are used on the pyrometers. They are taken off at the end of each working day, 4:30 p.m., and then are dipped in a thin shellac varnish to make the record permanent. New charts are put on the pyrometers each morning at 7 o'clock. When removed the chart is given a record number and is dated, signed with the initials of the foreman and the number of the furnace.



Layout of equipment in babbitting room

Bearings are poured with babbitting metal at a temperature of from 800 to 850 deg. Whenever new babbitt is added to the pot, the temperature drops, but is quickly brought up to the required temperature, which is a minimum of 800 deg.

Armature and axle bearings are poured in a vertical position with the collar end down. The end flanges of armature bearings are babbitted. After pouring a bearing, the burrs at the edges of the mold and the bearing windows are removed by hot irons, the same as for axle bearings. A 30-ton Watson-Stillman hydraulic forcing press in the center of the babbitting bench is used for the removal of mandrels after the babbitt has cooled.

Care is exercised in the handling and transportation of bearings from the babbitting room to the departments where they are fitted to axles or shafts. Sheet steel trucks have receptacles 2 ft. 4 in. by 3 ft. 7 in. by 21 in. deep into which the bearings are placed carefully. The cover is locked when it leaves the babbitting room and the foreman of the department to which the bearings go is the only person who has a key. The bearing trucks have three 8-in. diameter wheels and are towed by electric tractors.

ARTHUR E. CLEGG Is Awarded June Maintenance Prize

Attachment for milling out commutator-neck slots so as to clean out the leads and solder, submitted by Arthur E. Clegg, of the San Diego Electric Railway, is awarded the $25 monthly prize for June. Honorable mention is given to O. R. McClain of the Gary Railways, for compressed air vacuum cleaner

IN ORDER to speed the work of armature repairs, hand work should be replaced by machine work wherever possible. Cleaning out of old wires and solder from the commutator neck slots of armatures is tiresome and costly when done by hand. To eliminate the hand work Arthur E. Clegg, foreman of the electrical department of the San Diego Electric Railway, San Diego, Cal., designed and made a milling cutter for attachment to a commutator bar slotting machine. With this the slots are cleaned quickly and as they are left perfectly clean the work of soldering in new leads is facilitated. A description of this device for cleaning commutator neck slots was awarded the $25 monthly prize for June in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest.

Honorable mention is given to O. R. McClain, foreman of the air brake department Gary Railways, Gary, Ind., for his description of a compressed air vacuum cleaning equipment used in the shops of that railway. Interior cleaning of cars is another problem that is receiving much attention by electric railway maintenance forces. From the success with which vacuum cleaning equipment is used in the average household, it appears that such equipment is needed for the interior cleaning of cars. However, experience has shown that the household equipment is not sturdy enough to withstand the heavy usage required in railway shops. As a large number of cars must be cleaned daily, light portable equipment is particularly desirable and this must be of a construction that will withstand heavy-duty service and almost continual operation.

SHORT TIME LEFT FOR CONTEST

There still remains but a little over a week for sending in maintenance items for competition in ELECTIC RAILWAY JOURNAL'S prize contest. Any material mailed so as to bear a postmark up to midnight, July 31, will be entered. Those having material which they wish to send in are urged to submit it at once.

There has been quite general comment from the heads of maintenance departments and general managers of electric railways as to the great benefits which have resulted from the submission of these improved ideas in the contest. It has stimulated the men who are doing the work to give more attention to their problems, and to devise means for doing away with many of the tedious operations, in this way speeding up the work. Although this contest ends July 31, ELECTRIC RAILWAY JOURNAL will continue to accept maintenance items of this character for publication in its columns, and will pay $5 for each item that is accepted for publication. Maintenance men should bear this in mind when introducing any new improvements or new equipment. By passing on their experience to other electric railway men, the industry itself will be benefited materially and other maintenance men helped to perfect better maintenance methods.

Arthur E. Clegg

who was awarded the monthly prize for June in ELECTRIC RAILWAY JOURNAL'S maintenance contest, has had a wide experience in electrical and railway work, both with manufacturing and operating companies. While getting an education in the Antigo High School at Antigo, Wis., from which he graduated in 1912, he worked after school hours for the Antigo Electric Company on various electrical jobs. For several years after graduation he had charge of the meter department. He also worked for one year with the Cutler-Hammer Manufacturing Company, at Milwaukee, Wis., in the testing department, testing Navy and industrial control.

He broadened his experience and knowledge by seven years' service with the Westinghouse Electric & Manufacturing Company at East Pittsburgh, Pa. Here he attended the Westinghouse Technical Night School and worked in the testing department, and later in the engineering department as engineer on direct-current railway motors and control.

His railway operating experience began on the Indiana Service Corporation, Fort Wayne, Ind., where for two years he was engineer of equipment in the mechanical department. Here he was in direct charge of rolling stock electrical equipment, including maintenance, rebuilding of control apparatus, rewiring cars, new installations of equipment, and general electrical shop work. At present, and for the past 3½ years, he has been foreman of the electrical department of the San Diego Electric Railway, San Diego, Cal., in charge of maintenance of control and motors, and maintenance of ignition of buses. Mr. Clegg has originated a large number of improved methods for electric railway and bus maintenance work which save time and reduce costs.

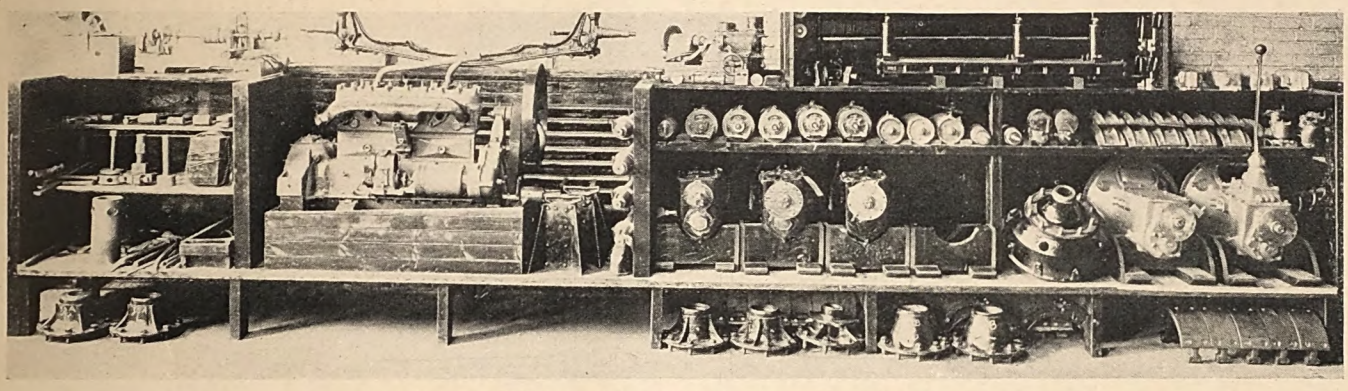
BUSES AND TRUCKS—16

Stand for Special Tools and Replacement Parts of Buses*

By John H. Walsh
Superintendent Rolling Stock and Shops Middlesex & Boston Street Railway, Waltham, Mass.

IN ESTABLISHING a system of unit overhaul at the Waltham repair shops of the Middlesex & Boston Street Railway for its fleet of 85 buses it was felt that centralization of replacement units would increase the efficiency of the shop and also serve to keep it neater. A stand was built for special tools and spare parts.

The differential and transmission units, which are heavy and awkward to handle, are placed in wooden cradles built for the purpose. When one of these replacement units is needed for service, it is rolled, with the aid of a small piece of pipe, upon a portable truck which is the same height from the floor as the heavy differential and transmission units. The spare motor is moved with the aid of an overhead crane. The total value of the replacement units and special tools in this stand is $5,824.



Stand arranged for special tools and replacement units of buses

Handling Bridge Ties During Replacement*

By G. C. Bridges
Assistant Superintendent Texas Electric Railway, McKinney, Texas

WHEN replacing bridge ties, some sort of a support is necessary in order to do the work economically and quickly. The accompanying illustration shows a device which has been used for several years by the Texas Electric Railway. It is made of 1¼-in. pipe with ells and nipples to give the desired shape. It is used in the replacement of bridge ties 8x8 in. by either 9, 10 or 12 ft. long.

Two longitudinal pipes extend over the top of the rail. At the end a loop is formed to go underneath the tie. The bottom nipple has a piece of 2-in. pipe put on to act as a roller. This permits removal of an old tie and replacement with a new one without lifting. Jacks are used to raise the rail. In order to permit them to fit between the ties, the feet of the jacks are sheared to a width of 5 in. Hooks at one end of the pipe catch over the opposite rail.

BUSES AND TRUCKS—17

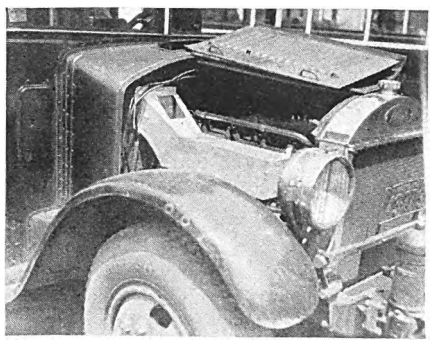
Exhaust Manifold Heater for Buses*

By C. B. Hall

Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.

HEATERS of various kinds supplied as standard equipment by bus manufacturers are of a type which conduct exhaust gases through the heater pipes running into the interior of the bus. Flexibility of the piping from the exhaust pipe connection to the heater pipes causes corrosion and breakage under vibration and permits noxious gasses to collect beneath the floor boards. After a study the mechanical department of the Virginia Electric & Power Company, Norfolk, Va., decided to adopt another arrangement for heating with hot air.

A sheet steel hood was used from the front of the manifold to the back which enters directly into the dash.



Exhaust manifold heater installed on Mack bus of the Virginia Electric & Power Company

The front hood being open adjacent to the fan, air is blown directly through into the bus from a point where it is gathered. As the manifold is the hottest part of the exhaust system the air forced over it provides sufficient heat for cold weather in the climate of Norfolk.

To use the heater the trap door in the dash is opened and the vent in the top of the heater hood closed. The trap door swings upward from a top-pivoted joint. When the dash opening is closed the vent in the hood provides circulation through it which prevents overheating of the manifold.

TRACK AND WAY DEPARTMENT—31

Diversion Track Facilitates Making Thermit Weld Joint Repairs*

By H. F. Merker

Chief Engineer of Ways and Structure Brooklyn City Railroad, Brooklyn, N. Y.

WHERE a large number of joints are to be welded the usual procedure is to remove traffic from the track. The Brooklyn City Railroad, Brooklyn, N. Y., found a particular demand for making repairs to individual joints which fail, and for this purpose a diversion track has been designed and built and is used successfully.

The rail used in this is a flat-guard type bolted to wooden stringers. The diversion is 1 ft. In the track, as shown, the end of the rail is placed 4 in. higher than the head of the rail in the permanent track. This permits the journal boxes of cars to clear the top of the mold box, although, if necessary, the mold box can be cut down several inches. Such a diversion track can be assembled and dismantled easily. It is light enough to be transported readily and occupies but a small space in a medium-sized truck. The run-off rails are similar to those used in portable cross-overs of the flat-rail type. Such an arrangement eliminates the costly practice of diverting cars or of using portable cross-overs.

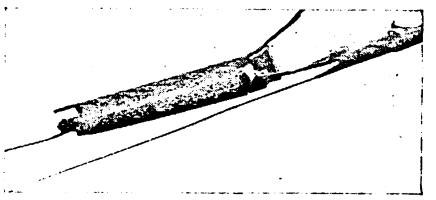
LINE DEPARTMENT—6

Covers for Overhead Contactors Reduce Short Circuits*

By Charles Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

CONSIDERABLE trouble was experienced on the lines of the San Diego Electric Railway, San Diego, Cal., during wet weather, from the current creeping to the track switch circuit plates on the overhead switch pans. This gradually burned a path across the insulation and caused a switch failure. Usually the resistance coils would burn out if the dashpot did not open. Several times the entire circuit control box was burned out. In some sections close to the sea coast, where salt air made it extremely difficult to keep exposed apparatus insulated, it was necessary to make repairs almost daily in wet weather.



Cover as installed over switch pan on the lines of the San Diego Electric Railway

These troubles have been overcome by the installation of covers over the switch pans of busy switches. This keeps moisture away from the parts. The cost of installation of the covers is small compared to the labor and material used in repairs where curves are not used.

POWER AND ELECTRICAL DEPARTMENT—3

Armature Clip Forming Device*

By S. Sheppard
Electrical Department Toronto Transportation Commission, Toronto, Canada

FORMING of clips has been facilitated by a small, hand-operated device developed in the electrical department of the Toronto Transportation Commission. The principle of operation is best explained by referring to the accompanying illustration. A strip of copper, previously cut to the correct size, is placed on top of the form between the guide pins. A steel core, placed on top of the copper strip, is then forced downward by the center lever, thus forming three sides of the clip. The center lever is then lifted and the two levers, one on either side, are closed together, completing the clip. The clip is removed and the steel core, which is very slightly tapered, pulls out quite easily. Use of the device has speeded up this work.

LINE DEPARTMENT—7

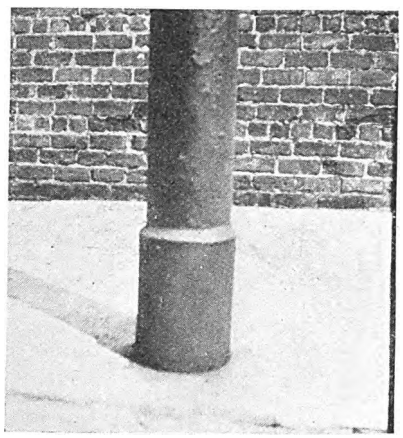
Resisting Corrosion of Steel Poles*

By H. G. Engelhardt
Engineer Railway Overhead Line Department New Orleans Public Service, Inc., New Orleans, La.

USEFUL life of a tubular steel pole is limited by the corrosion at the ground line. With reasonable precautions in inspection and painting, the life of a steel pole can be lengthened considerably. However, some poles fall short of receiving proper painting, and excessive corrosion sets in at the base and necessitates early replacement, although the upper portions may be perfect.

The New Orleans Public Service, Inc., has a very effective and inexpensive method of resisting corrosion at the base of steel poles. Before the pole is set a piece of standard wrought steel pipe, 2 ft. long and 1 in. larger in diameter than the pole, is slipped over the butt section. It is tied in position with a short piece of ½-in. tie line, its lower end being 5 ft. from the butt of the pole. The pole is then hoisted with a derrick and set in the hole and plumbed in the usual manner.

Three small wooden wedges are driven between the pipe and the pole to maintain a uniform separation of approximately ¼ in. Concrete is then poured around the pole and a very wet grout of 1 to 2 mix of cement and sand is poured in the separation between the pipe and the pole. The wedges are removed and the upper end of the pipe is chamfered with the grout to shed water, making the joint watertight. The pole is set the usual depth of 6 ft., which leaves 1 ft. of pipe remaining above the ground and 1 ft. below.



Typical installation of pipe sleeve on lines of the New Orleans Public Service, Inc.

The additional cost of setting a pole in the manner described is approximately $4. Such an installation costs considerably less than using the manufactured sleeve. However, this type of construction is limited to the setting of new poles only. The expense of stripping an existing pole for such an installation would not be warranted. There the manufactured split sleeve is the more economical.

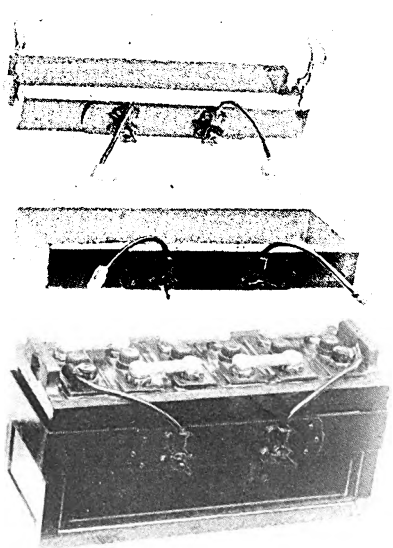
POWER AND ELECTRICAL DEPARTMENT—4

Combined Lifting Handle and Terminal Block for Rubber-Cased Batteries*

By F. W. Brash
Electrical Department Toronto Transportation Commission, Toronto, Canada

GREAT value is attributed by the Toronto Transportation Commission, Toronto, Canada, to a combined lifting handle and terminal block for batteries with rubber cases. Terminals placed on the side of a battery soon become loosened by the screwing on and off of the nuts. This is often exaggerated by the too common method of lifting the battery by the flexible leads, thus pulling out the terminals and chipping the rubber case. Such damages increase cost of repairs.



Combined lifting handle and terminal block for rubber-cased batteries

The new device includes a strap-iron band with handles attached to fit around three sides of the battery. The fourth side of the band is completed by a fiber terminal block upon which the terminals may be fastened much more securely. The case, which is larger at the top, may now be lifted by the handles on the band, while the battery leads prevent the band from slipping off at the bottom when not being carried. The iron band and handles are coated with acid-resisting paint.

THE BAKING OF ELECTRICAL INSULATION

The effective life of its insulation is the limiting factor in the amount of service to be expected from the electric motor—a fact that makes the choice and handling of insulating materials such an important matter in either its manufacture or servicing. Baking varnishes are materials of this class.

The rapidly increasing use of good baking varnishes for such parts as motor armatures, field coils, etc., is a direct result of the economic demand for equipment of greater dependability and service.

To be more specific, the use of a good baking varnish offers six distinct advantages on motor armatures and other electrical units which may be called on to operate under severe service conditions:

1. All the interstices in the windings and fabric covering are filled—air, moisture and dust are excluded—the dielectric strength of the insulation as a whole is increased, and the probability of insulation failure is greatly reduced.
2. Such treatment offers a greater resistance to ageing than any other of the liquid insulations of equal mechanical strength.
3. The armature or other unit treated has a higher degree of mechanical strength, the coils are fixed solidly in their slots and free from abrasion in case of a band wire failure.
4. The baking varnish acts as an effective seal for the seam between the commutator and the string band.
5. Baking varnish offers a high degree of resistance to cracking and shrinking by oxidation at service temperatures—increasing the effective service of the unit.
6. Dipping and baking of armatures insures the highest degree of uniformity obtainable in the finished product—thorough penetration of the insulation and better mechanical balance.

However, the baking varnish of itself is not sufficient in attaining these advantages. Its application requires care and above all the accurate control of temperatures and baking conditions, which can only be obtained with baking equipment scientifically designed and carefully constructed. Economy of operation in the baking department depends likewise on appropriate baking equipment.

Further details on the economy and practice of electrical insulation baking may be obtained from Young Brothers Company of Detroit.

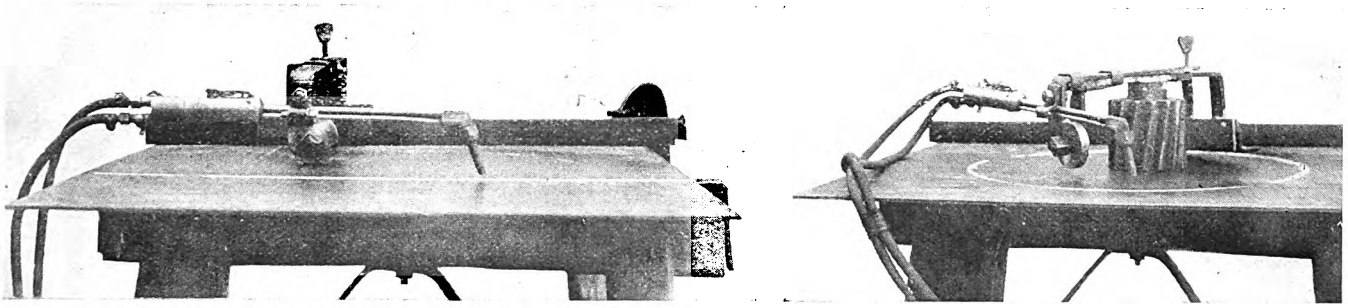
Acetylene Straight Line and Circle Cutting Fixture*

By Fred T. Cooper
Blacksmith Charleston Interurban Railroad, Charleston, W. Va.

FOR STRENGTH line and circle cutting with the oxyacetylene torch a cheap fixture has been found of particular value in the shop of the Charleston Interurban Railroad. This consists of an adjustable arm for holding the torch and a fixed member for clamping to the material to be cut. The adjustable arm slides back and forth from the main arm and is held in position by a thumbscrew. The main arm is fitted to an angle which in turn slides in the base angle iron guide clamped to the sheet to be cut. The work is held by a "C" clamp.

For straight cutting the operator, after clamping the angle-iron frame to the work, lights the torch and pulls or pushes the arm at a speed suitable to cut away the metal. Cutting lines will be free from ragged indentations.

For circle cutting the main arm is bolted to a round disk of metal about ½ in. or ¾ in. thick. This is bored out in the center. The pivot is made by fastening this to an old motor pinion. This provides for rotating and by means of the adjustable arm any size circle can be cut. A roller wheel holds the arm at a fixed distance from the material.



The fixture at the left is arranged for straight line cutting, while, as shown at the right, circle cutting is done by pivoting the arm to a central block

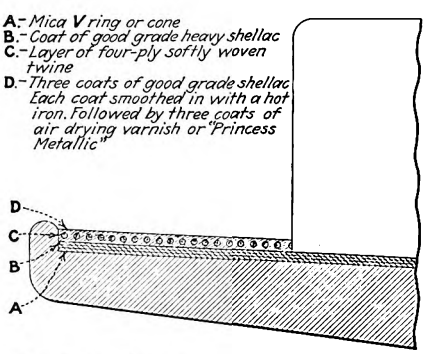
Insulating Commutator Spark Bands

By John S. Dean
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

IT IS of the utmost importance to give the mica V-ring or the cone extending beyond the commutator bars at the front end of the commutator, which is known as the spark band, a smooth, slick finish of insulating material. A dependable method which has stood up successfully under severe service conditions is indicated in the accompanying illustration.

It consists of coating the surface of the V-ring or cone with a good grade of heavy shellac and on this winding a layer of four-ply, soft-woven twine.



Insulation for commutator spark bands

Over this, three coats of shellac should be placed, each coat being smoothed in with a hot iron before the next is applied. The surface should be finished with three coats of air-drying varnish or Princess Metallic.

A smooth, even surface of the spark band produced in this manner can readily be kept clean and free from the detrimental oil and carbon dust which accumulate as a result of careless or indifferent maintenance. The spark band surface should be cleaned systematically by wiping with a clean, dry cloth at regular inspection periods.

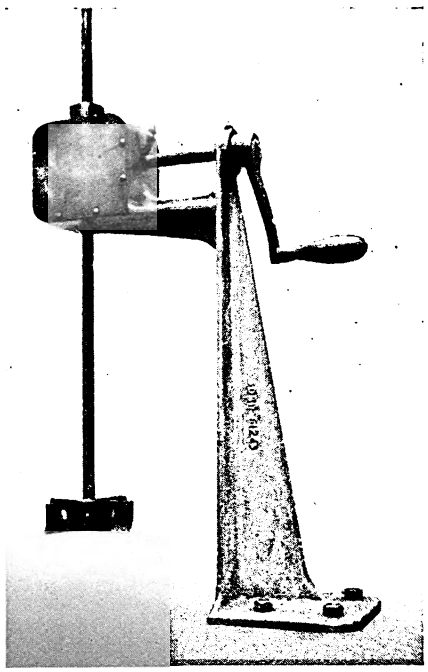
Simple Paint-Mixing Device*

By H. S. Williams

Assistant Superintendent of Equipment Department of Street Railways, Detroit, Mich.

SPRAYING of paint is made easier and faster with a simple device used in the shops of the Department of Street Railways, Detroit, Mich. It has a standard which supports a splined vertical shaft, upon the lower end of which is a four-bladed paddle. The shaft and attached paddle are raised easily so a paint container can be placed in position. The shaft is driven by a hand crank through a set of beveled gears. This multiplies the hand-crank revolutions by three. Various sized paddles may be substituted readily to accommodate different sizes of paint cans. Such a device could also be arranged for motor drive where the amount of mixing warrants it, and paint mixing is thus made easy.



Paint-mixing device used in the shops of the Department of Street Railways, Detroit, Mich.

Three Repair Jobs Without Taking Armature from Lathe*

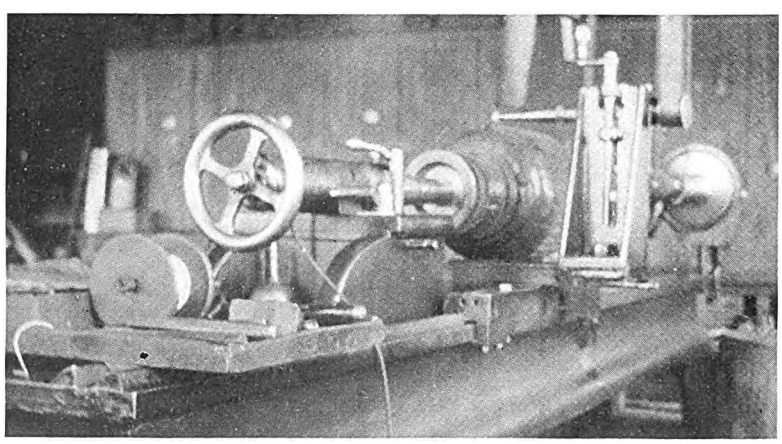
By R. T. Chiles

Master Mechanic Cumberland County Power & Light Company, Portland, Maine

BENDING, turning the commutator and slotting are done by one workman without removing the armature from the lathe in the shop of the Cumberland County Power & Light Company, Portland, Maine. This has been made possible by attachments to the lathe. A commutator slotting head, mounted permanently, is belt-driven from a 220-volt single-phase 1-hp., a.c. motor mounted overhead with an automatic belt tightener. The vertical feed is made in the slotter head and the cross and horizontal feeds are controlled at the lathe.

The slotter arbor is made in two pieces; a short section on the saw end of the arbor is screwed into a longer section, so that when an armature is put in the lathe it can be banded and the commutator can be turned without interference from the slotter saw by removing the short section. For slotting, the short section of the arbor is screwed into position again.

To carry off mica dust and make conditions more pleasant a small motor-driven exhaust fan has been mounted overhead. A tube from the fan is located over the slotter. The exhaust side is piped outside.



Attachment to lathe to provide for banding armature, slotting commutator and turning it without removal from the lathe

Combination Pneumatic and Cushion-Tired Wheel

COSTS of bus tires may be reduced materially by a "shock-absorber wheel," now being tested by the Northern Ohio Power & Light Company, Akron, Ohio. It was developed by L. G. Smith, purchasing agent for the railway.

At the time the company started buying buses the vehicles were delivered on 36x6 tires. It was thought these tires were ample to carry the load. Experience demonstrated that the service obtained from them was much less than was expected. They broke in the side walls as a result of heavy loads during peak hours. It was found necessary to increase the size to 34x7 and later to 38x8.25. This added thousands of dollars to tire investment.

With the idea in mind of strengthening the load-carrying possibility of tires, and holding down repairs costs, Mr. Smith designed the Smith combination wheel. This consists of a cushion tire mounted between two pneumatics to act as a shock absorber.

Dick Prescott Rides a Street Car

And Asks Some Questions

ABOUT ten days after Dick Prescott, superintendent of equipment of the Consolidated Railway & Light Company, and his new assistant, Steve White, had discussed the advisability of an inspection trip to study the practices of other properties, they got started. This was their second trip. The first was shortly after Mr. Milburn came as general manager and ushered in a program of improvements which had completely changed the outlook of the entire organization.

Grand City was their first stop. The railway there had completed a program of rehabilitating a large part of its equipment, including conversion to one-man operation. Steve and Dick succeeded in resisting the exhortations of taxicab drivers and boarded a street car, which, from a prominently displayed sign, they learned passed directly by the two principal hotels of the city. The operator had evidently been instructed regarding the needs of strangers on the depot line, for when he reached the first of the two hotels he announced not only the name of the street but also the name of the hotel.

Within the car Dick noted another innovation. In one corner was prominently displayed a map of the transportation system on which were indicated the locations of principal buildings, hospitals, parks, hotels and places of interest in the city, including some of the larger industrial plants and business establishments. In the opposite corner was a map of the particular line on which they were riding, showing the principal street crossings and corresponding street numbers to assist the stranger in determining how far he was from his destination. Important information regarding transfer lines crossed by the route on which they were traveling was also included on this second map. At the bottom of each map this message was prominently displayed: "If you are in doubt as to how to reach your destination, ask the operator of this car. He is thoroughly posted on the shortest routes to all important locations in the city and will be glad to help you."

Dick and Steve studied both maps with great interest.

"Those certainly are a big help to a stranger," finally ventured Steve.

"Indeed they are," agreed Dick; "not only a stranger, but even a regular rider in the city who has occasion to go to some section with which he is not familiar."

"What do you think of the sign at the bottom?" asked Steve.

"Sounds friendly; doesn't it? Suppose we try it out and see if they mean what they say."

Accordingly, the two travelers approached the operator, who was at the moment busily engaged in collecting the fares of several boarding passengers. They waited until he had again started his car, and then Dick purposely addressed him in rather a familiar tone of voice. Not being acquainted with the city, he had picked a location from the map about which to ask.

"Say, buddy, how do I get to the Tigers' baseball park?"

He watched particularly to see whether the question diverted the operator's attention from his duties, and noted that the man never took his eyes from the street ahead.

"Sorry, sir, but the Tigers are not playing on their home grounds today. However, if you want to get out to their grounds, you take a No. 6 car going north at Swift Street about a mile from here. If you look at the map in the car you'll see that it's only a short ride after you transfer. It will take you about twenty minutes from here."

Dick was impressed by the man's friendly tone, and by the fact that he seemed to enjoy giving the information, although he kept his attention on the street ahead.

Just as he started to make another remark the car reached a corner and came to a stop for a waiting passenger.

"Just a moment, please," interrupted the operator as he turned to make change, "Be with you again in just a second."

The car got under way quickly.

"Sorry, sir," resumed the operator, "Did you have another question?"

"I didn't know the Tigers were out of town. When do they get back?"

"Next Saturday. They play the 'Blues' from Steelville."

"Thanks very much," replied Dick. "I think we'll get off at the Brown Hotel. Is that very far?"

"Block after the next, sir," replied the operator. "I'll call it."

"Thanks," again replied Dick. He and Steve then waited in silence until they alighted at their destination.

Association Activities

An Outsider's View of the Industry's Needs*

By Harold V. Bozell
Bonbright & Company, New York City

ONE fact stands out to anyone making observations of the electric railway industry: From the point of view of capitalization it stands somewhere in the first ten industries in the United States. The intricate interrelationship of credit and investment in this country is such that naturally the financial and business world has an interest in the success or failure of an industry in which so much is invested. On the other hand, it cannot be overlooked that the electric railway industry largely has lost the confidence of the investment and banking world. Certain companies are making at least a partial if not a completely fair return on the money invested, but in many places companies are not making even a fair margin for reserves and there are instances where operating expenses are not being met.

A significant feature of the monthly statistics of the A.E.R.A. is that the nationwide total of passengers handled by the electric railways of the country, including their buses, stays about the same from year to year. This is, to say the least, not a bullish indication when we consider that the population of the country is steadily increasing. To be perfectly fair, however, there appear to be exceptions to this both ways, in that some companies are increasing their passengers carried and others are having decreases which are, at least, serious.

The traffic figures also show that there is a nationwide tendency toward a decrease of the proportion of passengers carried by rail and an increase of the proportion carried by bus. This is not disquieting as an indicator of the place of public transportation, but it does point to a problem involving business and financial judgment as to the proper adjustments to be made in shifting to a balanced operation, partly railway with heavy investment and lower unit operating costs, and partly bus with lower investment and higher unit operating costs. Again, this statement, as others, must be considered as a nationwide average, and subject to the necessary explanation that in some places rail passengers are on the increase and it should by no means be taken to be an omen that the bus will supplant the rail.

There is a feeling that the industry has been in worse throes than it is now and that while it is still in the position already outlined, that position is a point on the line of general improvement rather than of decline. Public mass transportation is necessary in American community life. Electric railways have been the victims of many factors such as the psychology of the fixed 5-cent fare, the load of burdensome and misplaced taxation, and still, in some localities, unrestricted competition from buses. Even a more important factor has doubtless been the enormous increase in paved streets and the unanticipated increase in automobiles, all of which has allowed people to do their traveling without the use of public transportation. The optimistic side of the picture is that, in spite of many factors which for years have worked against the steam railroads, including over-zealous regulation by the Interstate Commerce Commission, they are again enjoying a modicum of popularity in the business and industrial world. The electric railway, with bus systems co-ordinated in most localities in the country, is a local institution. The solution of its problems may be slow in being found, but that there must and will be some satisfactory solution to keep the electric railway in successful operation seems certain.

Widespread use of the automobile has meant a thinning out of distributed population and further reduction of the density of those using public transportation facilities. To operate any public transportation agency in reduced density means longer average rides and calls for higher average fare per passenger or lower operating cost. Such devices as express rail operation with buses to feed; private rights-of-way to keep tracks free from other surface vehicles; modernized equipment, parking restrictions for automobiles—all of which permit both more car-miles per car-hour and more appeal to the riding public—constitute lines of attack along which beneficial results may be obtained.

One very definite thought which occurs to many people analyzing the industry today is that the principal competitor of the electric railway is more frequently the private automobile than the competitive bus. The automobile is designed to wear out or be relegated to second-hand uses at the end of two, three or four years. Electric railway cars are designed for a life of twenty years or more. The automobile industry maintains extensive research departments and anticipates demands of the riding public. Change is ever present. Except for a few experimental street cars recently constructed and one or two other new projects which it is understood are now under way, there has been no fundamental modification of electric railway rolling stock since the introduction of the one-man car—and that was more an operating modification than a fundamental modification. True, cars have been improved so that they are more attractive and seats are more comfortable. Even that trend, however, is of comparatively recent origin. Some companies have gone far in reducing weight of equipment, but there has been little development comparable to that which the automobile industry is constantly making, and there has not yet been an answer to the question of the reduction of the noise. Can there not be something along the line of a really new rail vehicle built to the economic pattern of short life, low first cost, yet inviting performance from the standpoint of comfort, quiet, speed and economy of operation?

A factor which doubtless is working toward the improvement of the mass transportation industry is that our

streets are becoming more and more congested. Without doubt more extensive provision for the use of the private automobile is desired and will be made but it seems inconceivable that provision can be made extensive enough but that there must come a dropping off in the rate of increase in use of private automobiles. Therefore there will be some resultant reversion to the use of public transportation agencies.

The congestion of intercity highways is slowing up the delivery of package freight by truck. More highways will doubtless be built, but again there is limitation to the ability of the truck to handle everything, and even now truck companies are making proposals to electric railways to handle the shipment of goods for part of the distance for which the truck company has undertaken to make delivery.

It is well to bear in mind that the country-wide system of hard roads was made possible by the demands of private car owners. Just how far these roads may be pre-empted for commercial hauling without producing a popular reaction and consequent restriction of their use must not be overlooked in considering the relation between rail and highway transportation of both freight and passengers.

New Fare Philosophy Needed in the Industry

I cannot escape the conclusion that throughout the entire history of the electric railway industry there never has developed what might be called a complete fare consciousness or philosophy. There have been a few outstanding examples of breaking away from tradition and of recognizing that there are various kinds of rides to sell. The results are conclusive enough to indicate that there may be some hope in that direction. As a layman, I believe it desirable to have a 10-cent cash fare with a reduced rate token or ticket for the regular rider where possible. This plan allows changes of the fare that most of the riders use, and also allows changes smaller in proportion than that of a full cent. Weekly tickets, off-peak riding inducements, etc., may be added to entice various classes of riders.

Some two or three years ago the advisory committee on finance of the American Electric Railway Association made a report which gave concrete evidence of the attitude of the investment banking fraternity and made certain definite recommendations. That report still represents the views of that fraternity. Observation would indicate that there has not been any widespread activity to follow its recommendations. The principal step recommended is admittedly an uphill, difficult step to take. Some companies have done work along that line and others are doing so today. A re-examination of that report I believe to be worth while.

Somewhat disturbing, when one considers the future of the industry, is the apparently small number of able young men going into it. It is not drawing the well-trained young men of the country to the extent that other industries are doing in which there is more apparent hope of financial reward. It would be worth while if some way could be found to encourage the right kind of young men to join your ranks.

As a presentation of the outsider's viewpoint of the electric railway industry as it is today, I would not be giving you a true picture of my own attitude if I did not emphasize again that I believe there are ways now under test in various places in this industry which are helping to speed up its recovery from its worst days. When these and some others still in your minds but not yet in practice are applied, the industry may, without excessive optimism, look for accelerated improvement in its financial showing.

Electric Track Switches*

By M. Riedel
Manager of the Essen Street Railway, Essen, Germany

OWING to the lack of time available to the author after the assignment of this subject, he has had to confine this paper to a discussion of German practice.

The simplest form of electric track switch is one made up of two solenoids, one to throw the switch tongue in one direction, and the other in the other direction, as shown in Fig. 1. Each solenoid is operated by a contactor on the trolley wire. The motorman controls the movement of the switch by passing over one contactor with the current on, and the other with current off. This plan has the objection that it is difficult for the operator always to tell when the car is exactly under the contactor from which he wishes to draw current. Hence, a modification of this design has been brought out, using only one solenoid and one contactor. In this design, if the motorman wishes to change the position of the track switch he operates over the contactor with the current on. If he wishes it to remain as it is, he coasts over the contactor.

A further development is the use of an electrical relay between the switch-operating solenoids and the trolley wire. The purpose of this relay is to give a positive movement to the switch tongue, not always possible when the energizing current for the movement of the switch is that taken during the passage of the trolley wheel under the contactor. One form of relay switch is shown in Fig. 2, the relay being at *R*. *U* is a contact device for interlocking the contact. With this apparatus, the motorman who wishes to change the position of the tongue passes over the contactor with the current on. In this illustration the operating mechanism is shown as a pair of solenoids, but a motor can be used in their place, if preferred. By a simple connection to any one of these switches, signal lamps can be connected up to show the position of the switch tongue if desired, or connections can be arranged to operate an automatic block.

Any electric track switch operated from a single contactor can be arranged in one of two ways. In one (a) the motorman passes over the contactor with the current on, when he wishes to change the position of the switch tongue, and without current when the tongue is in the right position and no change is desired. In the other method (b) the switch tongue is arranged always to be in one position when the motorman passes over the contactor with the current on, and in the other position when he passes the contactor without current. Fig. 3 shows the connections for this plan. At first it was supposed that plan (a) was the best because it obligated the operator to look at the switch before he entered. This is objectionable because sometimes the position of the switch tongue is hard to see at night or in foggy weather, and it has to be illuminated. Again, the operator has to watch every switch and manipulate his control quickly when he sees its position. Operating preference now among the larger companies of Europe is for method (b). The motorman becomes accustomed automatically to the movement at each corner, is better able to follow the traffic on the street and is less apt to make a mistake. With this plant it is desirable to have a standard movement for all switches.

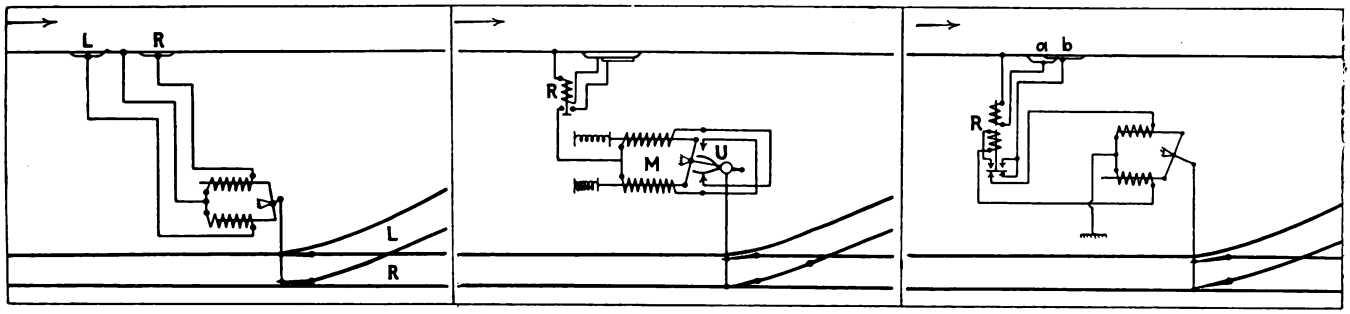
Still another combination possible is to have a standard position for the switch tongue and have it return automatically to that position after being thrown by a car to the other position. This is thought to have some advantages where the standard position is for the main line and the opposite position for a branch line. In the writer's opinion, however, this advantage is more than outweighed by the disadvantages. If by chance the switch should stay in position for the branch line, it is difficult for the car operator to return it to place. Moreover, derailments have occurred with cars following closely after each other, without time for the switch tongue to return to its standard position.

Where operation of the switch depends on the use or non-use of current for the car when it is passing under the contactor, difficulties have been experienced when the switch and contactor are at a grade. On an ascending grade with the current off, the momentum of the car is sometimes insufficient to pass it through the switch. On a descending grade, current on might give the car too great a speed. In such cases, if an electric track switch is desired, it may be connected up to be operated by a two-pole switch mounted on an adjoining pole.

The underground box holding the switch-operating mechanism should be

* Abstract of paper presented at the biennial meeting of the Union Internationale de Tramways, de Chemins de fer d'Intérêt Local et de Transports Publics Automobiles, held in Rome, Italy, May 6-12, 1928.

Digitized by Google



At left—(Fig. 1)—Simple solenoid-operated switch. In center—(Fig. 2)—Relay operation with interlock. At right—(Fig. 3)—Modification of connections of Fig. 2

water-tight and the electrical apparatus in it should be as simple as possible. A single solenoid runs the danger of damage to its winding, so that it will not operate in both directions. Damage of this kind is more likely when the winding is continually under trolley voltage and is subject to injury from lightning discharge. From this point of view, the use of two solenoids is better, since the danger of both being put out of business at the same time is less than with only one winding.

Another difference possible is in the arrangement of the windings on the solenoid. Where the solenoid operates from the current taken while the car is passing under a contactor, this current is apt to vary within wide limits according to the speed of the car, and the operator must notice to see whether enough current is taken to throw the switch. This disadvantage does not obtain for the relay system where the solenoids are fed directly from trolley voltage. Here the power available can be determined once for all, and the switch will operate positively even if the controller is on its lowest notch. For this reason relays have been adopted exclusively on the Essen system. Signal lamps showing the position of the switch can be used, but the best means of preventing accidents is a good light shining on the switches, as it also tends to diminish the danger of collisions with other vehicles.

Motor for Shifting Tongues

The weight of switch tongues calls for the employment of sufficient apparatus to throw them. Where a motor is used, a ½-hp., 300-r.p.m. motor can change the position of the switch within one second. A friction coupling prevents the gearing from being damaged if the switch tongue should get jammed. The wear of the motor is very small even for the brushes and commutator, because it runs for only a short time. After six months service in Essen of a motor-operated switch, the tips of the carbon brushes have not even yet begun to take the circular form of the commutator. The overhead contactor used with the motor-operated switch is a little longer than that where solenoids are used. The car crews believe that a switch operated by a motor does not function as well as those by solenoids because the tongue does not change position with a rush, but more gradually. In consequence, the men pass the overhead contactors of such a switch with more care and rather slowly. This is not an objection; in fact, it is an advantage.

It is difficult to express in money value all the advantages of electric switches, but it is safe to say that the expense of installation is soon made up in most cases by the saving in labor and reduction in number of stops.

Electric switches should always be arranged so that they can be moved by hand, if necessary. Electric switches ought to have a positive movement and such spring arrangement that they will not be thrown by vehicle wheels.

Second National Fuels Meeting

UNDER the sponsorship of the American Society of Mechanical Engineers the Second National Fuels Meeting will be held in Cleveland, Ohio, on Sept. 17-20. The program, which recently was completed, includes papers on coals and preparation of coal, recent developments in boilers and methods of boiler water conditioning, developments in power plant construction, progress in use of pulverized coal, railroad practice and smoke abatement.

Victor J. Azbe is chairman of the fuels division executive committee.

American Association News

American Executive Committee

REPORTS by the several committees handling arrangements for the coming Cleveland convention occupied the major attention of the American Electric Railway Association executive committee at a regular meeting held on board the yacht *Florida* on July 13, 1928, as the guests of Barron Collier. Those present included President R. P. Stevens, J. H. Hanna, Lucius S. Storrs, Barron Collier, W. H. Sawyer, J. S. Kubu, R. H. Dalgleish, Edward Dana, M. B. Lambert, S. J. Cotsworth, C. R. Ellicott, H. C. Aller, representing A. S. Grenier; E. F. Wickwire, T. W. Casey, J. R. Fitzpatrick, F. R. Coates, J. H. Pardee, R. F. Carbutt, J. W. Hancock, W. S. Rodger, W. C. Slade, E. C. Faber, L. H. Palmer, J. W. Welsh, E. J. Murphy, Labert St. Clair, F. C. J. Dell, Charles Gordon, J. Vignee and Robert Dougan.

Further progress in the convention program arrangements was reported by Chairman Coates. Acceptances have been received from most of the speakers and in addition arrangements have been made for the speaker for the Advisory Council program Tuesday evening of convention week. Plans have likewise been completed for luncheon conferences similar to those which proved so popular last year. At each a sponsor will guide the discussion. The buffet plan of serving lunch will be followed so as to conserve time. President Stevens commented on the high character of the program which has been arranged and congratulated the committee particularly on the fine array of speakers and the excellent balance in the treatment of the several subjects, which are of outstanding interest to the industry.

Publicity Material Issued

Work of the publicity committee, as outlined in a report by Barron Collier, vice-chairman, has culminated in the issue of a supplement to the advertising handbook prepared originally by the committee. With the supplement there now are available approximately 5,000 samples of electric railway advertising, carefully selected to furnish suggestions to member companies. A publicity program has been planned to stimulate attendance at the convention. The first mailing pieces have already been issued.

Vice-chairman Casey reported for the membership committee. An abstract of the report is published elsewhere in this issue. Secretary Welsh reported on the association's finances in the absence of Chairman T. A. Kenney. Actual receipts and expenditures indicate close adherence to the budget. With a loss in revenue of approximately $16,000, due to resignation. Receipts for the year are expected to fall within a very small amount of the estimate made when the new schedule of dues was inaugurated with the adoption last year of the revised constitution.

For the publications committee,

Digitized by Google

Chairman Hanna reported on the meeting held June 1, 1928, to consider generally the result of the new publishing plan for *Aera*. The committee felt that the improvements made in the magazine and its increased value to member companies justified an effort to increase the circulation. Accordingly a letter was sent out over the signature of Managing Director Storrs, asking for expressions regarding the character of the publication and suggesting the advisability of increased circulation among the rank and file of electric railway employees. A total of 53 replies to 338 letters sent out, were received up to the time of the report. Of these, 40 expressed approval of *Aera* in its new form, six suggested further improvements, three were dissatisfied with the changes that have been made and four expressed no opinion.

Entertainment at Cleveland

With the selection of an orchestra and a soloist, entertainment plans for the convention have been practically completed and there is assurance that this feature of the week's program will exceed in popularity anything attempted within recent years. On the recommendation of the entertainment committee and with the strong indorsement of President Stevens, the executive committee approved the engagement of Rolfe's nationally-known orchestra. Since dancing is to be one of the principal forms of entertainment the committee felt that the character of the music was of utmost importance and that the success of this feature is assured by the selection of Rolfe's Palais d'Or orchestra, whose dance music is one of the regular radio features from station WEAF. Another musical feature of outstanding merit will be a song recital by Miss Phoebe Crosby, on Tuesday evening of convention week.

A new poster being prepared by the committee on co-operation with manufacturers was described by Chairman Wickwire. This will be prepared in large size and will be known as the "Pay-Day Poster." Its purpose will be to call to the attention of manufacturers' employees that the business of electric railways helps to fill their pay envelopes.

Car Replacements Necessary

In the absence of Chairman L. C. Bradley, Mr. Storrs outlined the report of the committee on electric railway finance, calling attention to the importance of car replacements in the rehabilitation of electric railways and opening the way for the extension of more liberal terms in the financing of new car purchases. The committee suggested that advance publicity be given to this report, so that it might receive the attention from the entire industry that its importance warrants.

A report by the hotel committee, read by Secretary Welsh, indicates that the number of people to be accommodated at Cleveland this year will exceed those attending last year's convention. Reservations exceed by 177 rooms and 226 people the number requested at the corresponding date last year. Although the Cleveland and the Hollenden Hotels have been practically filled, there are ample rooms available in the several other hotels to insure satisfactory housing of the convention.

The transportation committee, through its chairman, Mr. Faber, reported on arrangements for special trains and reduced fare rates to the convention. In addition to a round-trip rate of 1½ times the regular one-way fare and good for the period of the convention, there will be another round-trip rate this year of 1⅝ times the one-way fare, good for 30 days. Special trains will be run from New York Friday evening, Sept. 21, on both the Pennsylvania and New York Central railroads, to arrive in Cleveland on Saturday morning, Sept. 22. A special train from St. Louis will leave on Friday night, and special cars will be attached to trains leaving Saturday night. From Chicago special cars will be attached to trains leaving Friday, Saturday and Sunday nights.

A report on the recent meeting of the International Electric Railway and Bus Association held in Rome was made by T. W. Casey, the American Association's delegate. Mr. Casey outlined the proceedings and called attention particularly to the effort being made in Europe to use cars and buses with one man, and to the attention being given American practice in this respect.

Affiliated Association Matters

Reports were received from the presidents of the several affiliated associations. President Stevens called upon representatives of the several state and sectional associations who were present.

The death of Past-President Robert I. Todd, was announced, and a committee was appointed to draft resolutions expressing the association's grief and appreciation of Mr. Todd's personality and accomplishments. It was also considered appropriate to prepare resolutions expressing the association's appreciation of J. K. Choate, recently deceased, an outstanding leader among the industry's pioneers.

A motion was adopted that the executive committee open to all convention delegates its next meeting, to be held in Cleveland, at 10 o'clock Saturday morning, Sept. 22, for the consideration of final reports of standing committees.

Since the executive board of the Bus Division of the American Automobile Association is to hold a regular meeting in Cleveland during convention week, it was voted to extend guest privileges to all members of that organization, following the precedent established at previous conventions.

Luncheons Again a Feature

FIFTEEN luncheon conferences for the interchange of experiences and discussion of outstanding problems will be an important feature of the convention at Cleveland this year. These luncheon groups met for the first time last year. Each was limited to 50 guests, and almost without exception more than this number sought admission and all could not be accommodated. This year a limitation again will be set on the number of guests, and the only way a person can insure a place at the luncheon or luncheons he wishes to attend is to make an early reservation.

Luncheon meetings will be held on every day of the American program, from Monday to Thursday, Sept. 24-27 inclusive. The tentative program of meetings as prepared by the meetings and subjects committee follows. In some cases, not more than two or three, there may be changes in the sponsors, but in the main this program will stand.

Day	*Subject*	*Sponsor*
Monday....	Safety.....	James P. Barnes
	Fares.....	C. D. Emmons
	Taxation.....	W. A. Jackson
	Manufacture.....	E. F. Wickwire
Tuesday...	Interurbans.....	D. W. Snyder, Jr.
	Traffic.....	E. J. McIlraith
	Education.....	Edward Dana
	Merchandising...	Barron Collier
Wednesday.	Financing.....	Luke C. Bradley
	Public Relations..	W. E. Wood
	New Cars.....	J. R. Blackhall
	Small Cities Problem of Transportation.....	Harold L. Geisse
Thursday..	Freight.....	L. M. Brown
	Management.....	R. F. Cartutt
	Motor Bus.....	A. M. Hill

These luncheon meetings have developed real discussion, something that has been sought in association conventions for many years. They give younger men in the industry the benefit of the experience of older men, and give the older men an opportunity to find out just what young minds are thinking.

New Association Members

ELECTION of one operating company, ten manufacturers, two state associations and ten individuals was effected at the meeting of the executive committee of the American Association held on July 13. A list of the new company members follows:

Operating

East St. Louis, Columbia & Waterloo Railway, East St. Louis, Ill.

Manufacturer

Canadian Cleveland Fare Box Company, Preston, Ont., Canada.

Chase Appliance Company, New York, N. Y.

Delco-Remy Corporation, Anderson, Ind.

Everhot Manufacturing Company, Maywood, Ill.

Four-Way Lock Company, Cleveland, Ohio.

Hudson Electrical Heating Corporation, New York, N. Y.

James H. Matthews & Company, Inc., Pittsburgh, Pa.

Oliver Iron & Steel Corporation, Pittsburgh, Pa.

Whitcomb Wheel Company, Kenosha, Wis.

White Manufacturing Company, Elkhart, Ind.

State and Sectional Associations

Indiana Public Utility Association, Indianapolis, Ind.

Missouri Association of Public Utilities, St. Louis, Mo.

News of the Industry

Progress on Boston Legislation

Governor Fuller declines to prorogue the Massachusetts Legislature before it has done something with the Boston Elevated Railway situation. Some progress has been made as a result of the Governor's insistence. The House has passed to be engrossed the bill to extend the Boylston Street subway under Governor Square, with the provision that half of the cost is to be paid by the Elevated and the other half by the cities and towns in which the Elevated operates. A special commission is to be appointed by the Supreme Court to apportion the cost.

Another measure passed for engrossment provides for a special commission to investigate the further rapid transit needs of Boston, Chelsea, Revere and vicinity. This calls for the appointment of one member from the Senate, three from the House, two to be appointed by the Governor and one by the Mayor of Boston—a total of seven members.

The third proposition remains unsolved and Governor Fuller is considering the matter of writing another special message. This relates to the control of the Elevated. The twelve-year extension bill which came from the special committee after the Governor's latest message was passed by the Senate and killed by the House. Now the Governor proposes to hold the Legislature in session to consider further suggestions on that point.

Tire Man Heads Akron Transportation Committee

Charles W. Seiberling, vice-president and treasurer of the Seiberling Rubber Company, has been named chairman of the fact finding committee recently appointed by the City Council to look into the transportation situation in Akron, Ohio. The survev will include all phases of the question relative to operating costs, income, profit and other matters incidental to the operation of the railway and bus systems.

Councilman Pierce Schneider, chairman of the Council public utilities committee, said:

The survey will be thorough and will give the taxpayers of this city a definite report on the transportation situation before the proposed new franchise is drawn up for presentation to voters this fall.

The present franchise expires in December. Whether the new franchise will differ from the temporary one under which the company now operates will depend largely upon the report returned to Council by the fact finding committee.

Members of the committee are Charles W. Seiberling, vice-president and treasurer of the Seiberling Rubber Company; Frank H. Adams, former treasurer of the Goodyear Tire & Rubber Company; Attorney Edwin Brouse; P. T. McCourt, contractor; James B. Pergin, president and treasurer of the Central Hardware & Stove Company; Benjamin F. Graves, linotype operator at the Akron *Times-Press*, and Guy E. Shumaker, head of the transportation committee of the Goodyear assembly.

End of the Parade—The Horribles

There is magic in music. Dark magic. As every politician knows. And so the band is never missing from election propaganda. Its blare of brass, beat of drums and clashing of cymbals thrill the crowd.

All eyes and ears are for the marching musicians and their stirring strains. Cheers! Cheers! Cheers! For the drum major, for his smartly dressed crew, for the tune they are playing. Vote for This; Vote for That! is the melodious appeal. And votes are seldom lacking. The Pied Piper gathers his voters and leads them to the polls.

In San Francisco the Municipal Ownership Band has led the procession and marching feet have kept step to the rhythmic "Bonds, Bonds, Vote More Bonds!"

Now the Big Parade has passed and so have municipal ownership projects to a total of $129,500,000. Bringing up the rear of the disbanded procession is the Horribles section. Horrified, the crowd shuts its eyes and turns its back on the small man carrying the big load of bonded indebtedness. But the picture cannot be shut out. Though the band has gone, the burden of municipal ownership remains.—San Francisco *Bulletin*.

Prospects Remote for Early Use of Cincinnati Line

A special joint committee of the Rapid Transit Commission of Cincinnati, Ohio, and a committee of the City Council conferred recently with Walter A. Draper, president of the Cincinnati Street Railway, about the possible operation by Mr. Draper's company of the unfinished rapid transit system, which already has cost taxpayers $6,000,000. Mr. Draper said that his company could not take over operation of the system, even if its financing and completion were approved by the voters, under any terms which the city could afford to accept. The general feeling in the joint committee, openly expressed, was that the people would not vote more money now for the work.

Mr. Draper's statement of what his company could afford to undertake meant in effect that the only possible basis of operation from his point of view would be one in which the company would be guaranteed against loss. He based his attitude upon an analysis of the Beeler report on the rapid transit situation made by Drum & Company, who estimated a deficit of $818,339 for 1930, the proposed first year of operation, ranging down to a deficit of $51,-118 in 1934, and mounting to a profit of $111,041 in 1935. Mr. Beeler estimated a deficit of $26,111 for 1930, with a deficit of $39,560 the next year and then ranging up to a profit of $480,777 in 1935.

After discussion of all these elements the Rapid Transit members of the committee adopted a recommendation that the commission turn over to the Council committee all its data on the subject. The Council's committee will recommend postponement of the project until more practicable means of financing may be found.

The two major ideas toward more satisfactory financing are the proposal to obtain state legislation enabling the levying of about $2,500,000 of the construction cost on property owners who benefit by the line and the insistence of Mayor Seasongood that St. Bernard and Norwood should be made to help pay for the system because they would benefit so largely from the operation of the line.

Another legislative amendment that probably will be sought this winter so the decks may be cleared for possible future completion of the system will be permission to issue bonds on a 50-year sinking fund basis instead of on a serial basis. This would enable the system to get a better start financially in its early years of operation.

The committee that conferred with Mr. Draper had been named to discuss

Digitized by Google

the feasibility of negotiating an operating lease and its submission with a bond issue to the people. A bond issue of this kind would have called for $8,000,000 to $10,500,000, the $6,000,000 voted in the beginning already having been spent. The committee consisted of E. W. Edwards, chairman; P. O. Geier, B. H. Kroger and Christian Schott, for the commission; Tyler Field, chairman, Fred Schneller and Charles O. Rose, for the Council.

As matters appear to stand now an additional sum of $10,000,000 is required to be spent in order to realize on the present $6,100,000 investment.

C. C. McChord Retained in Philadelphia

State commission, city and Philadelphia Rapid Transit Company to draw up temporary agreement for operation of Market Street subway. 7½-cent fare urged pending final settlement

FOLLOWING the receipt of a joint petition from the city of Philadelphia and the Philadelphia Rapid Transit Company, in the matter of a proposed lease of the Broad Street subway, the Public Service Commission has engaged the services of Charles C. McChord, Washington, to make a survey, report and recommendation, upon the factors and elements involved.

The commission has also directed its bureau of engineering to make a study and report upon the feeder lines that will be necessary or advisable in order to render the Broad Street subway useful and available to the largest possible number of passengers. The commission considers the subject of feeder lines, particularly for the northern and northeastern sections of the city, one of the most important in connection with subway operation. The bureau will start immediately upon this work and will invite the co-operation of the department of transit and the Rapid Transit Company.

As the commission sees it, in taking these steps, it undertakes the duty which devolves upon it, under the provisions of the Public Service Company law which have been invoked by the Mayor and Council, since its purpose is to establish a sound and equitable basis upon which the great subway project may be made most serviceable to the public.

In acting as it did the commission has taken cognizance of the message of Mayor Mackey to the City Council in which it was indicated that the subway might be ready for operation on Sept. 1. The commission sees no insuperable difficulty in beginning operation at a given date prior to the determination or consummation of the terms of a lease, provided the city and the railway are willing to enter into arrangement for operation on a temporary basis. On this point the commission says:

> One advantage of such an arrangement, even for a short period, would be that it would provide figures of actual results to supplement and confirm traffic estimates upon which calculations of revenues and expenditures must be based. This would particularly be the case if the subway operations should be started on the same rates of fare as now apply on the present lines of the Rapid Transit Company.

In a voluminous report to the commission last year, Mr. McChord recommended that the city take over the underlying companies of the P.R.T. system at an estimated cost of $136,000,000, a program upon which the Mackey administration already has embarked. He also suggested that the city turn over the Frankford elevated, as well as the Broad Street line, to the P.R.T. rent free, notwithstanding the city is now receiving $780,000 a year rental from the city-built elevated; that the city should waive P.R.T. payments of paving tax, about $600,000 a year; that the city waive payments of dividend taxes to the underliers, about $115,000 a year; that the city arrange a guarantee for the payment of the P.R.T.'s 7 per cent preferred dividends and an 8 per cent dividend on its common stock; and, finally, that the city should commit itself to acquisition of the entire P.R.T. system in 1957, for the par value of its outstanding stocks, now authorized up to $65,000,000.

An official statement says:

> Judge McChord was selected for this important work by the commission because of the fact that his previous investigation into general transit conditions in the city of Philadelphia, in addition to his long public experience in transportation matters, eminently fit him for the task. Judge McChord has been given full powers by the commission to make his studies complete and comprehensive.
>
> He has accepted the work with the understanding that he will make thorough study and analysis of all the conditions that should enter into the consummation of a lease that will be fair and equitable to both city and company, as well as dealing fairly with the interests of the car rider and the taxpayer.
>
> The work under Judge McChord's direction will proceed as expeditiously as possible, but, as is obvious, no fixed time can be set for his report to the commission. Fortunately, the commission has available in its own records and studies considerable data bearing upon the Broad Street subway, and it is the commission's understanding that the city's Transit Department and the Rapid Transit Company also have traffic studies and calculations available in reference to the subway's operation. These data are all contained in previous reports upon the subway and other transportation operations. They give a substantial basis upon which Judge McChord's work will proceed and will save a great deal of time.

McChord Called in Again

CHAIRMAN AINEY, of the State Public Service Commission, yesterday made it evident that it is the purpose of the commission to co-operate with the city and the Philadelphia Rapid Transit Company in framing an agreement for the operation of the Broad Street subway. The employment of Charles C. McChord to make a study of the situation, supplementing his previous investigation made at the instance of the commission, is itself significant. For the report of 1927, made by Mr. McChord, was in close harmony with the known preferences and program of the P.R.T., and in retaining its author for another report the commission indicates its hope of an amicable understanding.

There is also food for thought in the intimation by Chairman Ainey that it may still be possible to carry out the Mayor's plan to have the subway in operation by Sept. 1, at the present rate of fares, under a temporary agreement between the city and the P.R.T., pending a final determination of the lease questioned by the commission.—Philadelphia *Ledger*.

Sunday and Holiday Pass in Oakland

Authorization was given the Key System Transit Company Oakland, Cal., on July 10 by the Railroad Commission to establish for a period of approximately 60 days, starting July 15, a Sunday and holiday pass, to be sold for 25 cents, entitling the holder to an unlimited number of rides on the street cars and buses in the east bay cities. This experiment in the east bay territory is an endeavor on the part of the company to establish fares that will attract additional patronage.

The Railroad Commission in a recent decision refused to authorize the railway to increase street car fares, but in denying the application the commission suggested that an experiment be made with some form of fare that would have more chance of success than a horizontal increase.

Only One Amendment to Omaha Grant

Only one amendment has been added by the City Council of Omaha, Neb., to the ordinance submitting at the November election the question of granting a 30-year franchise to the Omaha & Council Bluffs Street Railway. This amendment, a proposal that all mail carriers in uniform shall be carried free, was opposed by President Shannahan as unfair, but it was arranged that the government should pay direct to the company the entire appropriation for defraying the way of men on duty. Practically all of the local opposition that defeated the franchise in the form submitted by the company two years ago has disappeared. The June report of the company shows that the decline in revenue and number of passengers carried has been cut in two.

Expert at Work on Washington Valuation Data

Milo Roy Maltbie, retained in connection with the valuation survey of the railway lines and the bus property in Washington, D. C., has been conferring with John W. Childress, chairman of the Public Utilities Commission. Others who have attended the conference are Ralph B. Flaherty, people's counsel before the Public Utilities Commission, and Francis H. Stephens, assistant corporation counsel, who several years ago carried the valuation case of the Capital Traction Company through the local courts. The commission plans to turn over to Mr. Maltbie and his staff data and records relating to the valuation cases. Mr. Maltbie will maintain headquarters in the Senate District committee's room in the Senate Office Building. It is likely that he will prepare a preliminary report in four or five weeks for submission to Senator Capper, chairman of the Senate District Committee, by which he has been retained in connection with the proposal to consolidate the local railway and bus lines.

Railroad Boosts Railway Pass in St. Louis

The St. Louis Southwestern (Cotton Belt) Railroad in its advertising posters is telling patrons the advantages of the 25-cent Sunday pass issued by the St. Louis Public Service Company, St. Louis, Mo. Many out-of-town visitors are using the passes to "See St. Louis Safely and Savingly."

On Sunday, July 1, the first day that the new flat 8-cent fare was effective on the line of the St. Louis Public Service Company, a total of 40,851 Sunday passes was sold, an increase of 7,112 over the previous Sunday.

Another Unification Plan for New York

Original proposal by commission's special counsel modified. Municipally controlled company would issue bonds to acquire rapid transit lines now privately operated

A TENTATIVE unification plan for New York City rapid transit lines has been presented to the Transit Commission by Samuel Untermyer, its special counsel. The plan provides for the formation of a public corporation for the municipal operation of the new city system and parts or all of the Interborough Rapid Transit and the Brooklyn-Manhattan Transit rapid transit lines. The public corporation would pay for the company-owned rapid transit lines by issuance of bonds which would be somewhat similar to those of the Port of New York Authority. It would also lease company-owned lines to be acquired and the new city subway system.

Roads Under Public Direction

The new corporation would be controlled by nineteen directors of whom four, including the Mayor, comptroller, president of the Board of Aldermen and chairman of the Board of Transportation, would be ex-officio members. The other fifteen would be appointed by the Mayor for overlapping periods of ten years to minimize political interference. Of these latter directors a maximum of four may be nominated by the Interborough, B.-M.T., Williamsburg Company, and Manhattan Railway, depending upon how many of the latter companies come into the plan.

The public corporation would operate all lines as a unified system and the application of the pooled revenues would be in the following order of priority:

1. An amount to the city equal to the annual rental (approximately $2,655,000) being currently paid under contracts 1 and 2.
2. Taxes and rentals for miscellaneous property.
3. Operating expenses.
4. Maintenance charges to be fixed from year to year by the board of the public corporation.
5. Renewal or depreciation fund to be fixed in like manner.
6. Interest and sinking fund on the outstanding funded indebtedness of the respective companies subject to which the company-owned properties were assigned to the public corporation.
7. Interest and sinking fund on the outstanding bonds of the public corporation issued under the plan.
8. Interest and sinking fund on additional bonds of the public corporation issued for the construction or provision of additions to or betterments of additional equipment for the existing lines.
9. Additional payments into the interest fund until the initial amount shall be increased to equal two years' interest and sinking fund on the outstanding funded indebtedness of the respective companies and on the outstanding bonds of the public corporation.
10. Interest and sinking fund on the investment of the city in the properties of the city embraced in contracts 1 and 2 provided for.
11. The balance, after setting aside such portion thereof for working capital or contingency reserve as the board of directors of the public corporation may determine, to be applied to the reduction of the funded indebtedness of the respective companies until the retirement of such indebtedness in full, thereafter to the retirement of outstanding bonds of the public corporation, until such retirement thereof in full, and thereafter as the city may direct.

Accrued preferentials under existing contracts would be canceled under the Untermyer plan. On April 30, last, the Interborough claimed accrued preferentials of $2,278,925, the B.-M.T. $13,536,153, the city under contract 3 with the Interborough $86,438,867 and under contract 4 with the B.-M.T. $56,545,055.

City-owned property now under lease to the companies would presumably be paid for at the recapture price provided for under contracts 3 and 4. Payment for the company-owned properties would be made at prices to be fixed by agreement between the city and the respective companies.

In addition to the interest fund there is to be an improvement fund of $45,000,000 to be provided by the city in three annual installments of $15,000,000 each. This fund is to be used for general improvement of service.

One of the salient features of the plan is the formation of subsidiary companies of the public corporation to take over the new city lines and future lines. Such subsidiaries would have a nominal share capital and would be operated by the board of the public corporation. The purposes of this segregation into separate corporate entities with separate accounting but operated as a unified system are:

1. To permit of the release of city bonds from the debt limit on the basis of the net earnings of existing lines undiluted by the burden of interest and sinking fund payments on bond issues now being made for constructing the new lines or those that may hereafter be issued for future lines. The bonds thus released as self supporting would be made the basis of credit for further subway construction.
2. To enable the subsidiaries to borrow on their own credit a substantial proportion of their construction costs and thus create still further sources of credit based on their independent revenues, again without impairing the city's debt-incurring limit.

The boards of the various companies will probably appoint committees to negotiate with the city if the latter, through the Board of Estimate, approves of the general plan of procedure outlined.

In a report accompanying the tentative readjustment plan Mr. Untermyer recommends that the Transit Commission, with the approval of the Board of Estimate, serve notice on the Interborough and the B.-M.T. of intention to recapture the recapturable portions of those systems in event negotiations as to price between the companies and the city fail.

Forcible Recapture Suggested

The plan contemplates the unification of the Interborough Rapid Transit Company, Manhattan Elevated, B.-M.T. elevated and subway line, Williamsburg Company and the new city system. In the event negotiations with the Interborough should fail, the Manhattan Elevated, now under lease to the Interborough Rapid Transit Company, would be eliminated from the new system which would then include, according to Mr. Untermyer's recommendations, the recapturable portions of the I.R.T. subway, the B.-M.T. subway and elevated lines, Williamsburg Company and the new city system. In case all negotiations fail Mr. Untermyer recommends that the recapturable portions of the I.R.T. and B.-M.T. be combined with the new city subway.

Bankruptcy Law Does Not Cover Street Railway Companies

According to a decision of the Circuit Court of Appeals for the Fourth Circuit, a street railway company, certainly when it has suburban extensions, must be considered as a railroad corporation where that term is used in Section 4-a of the federal bankruptcy act. In other words, it cannot come under the provisions of that act, which, in Section 4-a, excludes "railroad corporations."

The question arose because the Columbia Railway, Gas & Electric Company of Columbia, S. C., which abandoned all railway service on March 11, 1927, petitioned to be adjudicated a voluntary bankrupt. Two years previously, or in 1925, under authority of an act of the South Carolina Legislature, it had disposed of all its gas, electric light and power property to the Broad River Power Company.

In denying this petition the Circuit Court of Appeals declared that all the trend of previous decisions was to include street railways under Section 4-a of the bankruptcy act. Two cases which appear to give a different view, In Re Grafton Gas & Electric Light Co., 253 Fed. 658, and Omaha Street Ry. Co. *vs.* Interstate Commerce Commission, 230 U. S. 324, were analyzed and differentiated from the Columbia case. On the other hand, the court quoted, as sustaining its contention, Central National Bank of Worcester *vs.* Worcester Horse Railroad Co., 95 Mass. 105-106; New England Eng. Co. *vs.* Oakwood Street Ry. Co., 75 Fed., 162; Minneapolis St. Ry. Co. *vs.* City of Minneapolis, 155 Fed., 989, 995, and other cases.

Report Favorable on Pennsylvania Electrification

The Pennsylvania Railroad states that the physical work of electrifying its main line between Philadelphia and Wilmington, started more than two years ago, and the Octoraro branch between Philadelphia and West Chester, started in April, 1927, has been progressing satisfactorily and according to schedule. As a result the company expects to start electrical operation of commuting and local trains the latter part of September, coincident with the customary change in time tables which places the fall and winter schedules in effect.

Dry Dock Fare Denied—September Hearing

The New York Transit Commission recently set for some time in September hearings on the application of the Dry Dock, East Broadway & Battery Railroad, subsidiary of the Third Avenue Railway, to put 7-cent fare schedules into effect, giving Alfred T. Davison, counsel for the Third Avenue Railway, permission to set the exact date. The commission suspended the proposed tariff to put increased fare schedules into effect July 24 pending hearings and final decision by the commission.

Ten Cents Under Injunction in Chicago

Under a temporary injunction granted on July 16 by the Federal District Court, the Chicago Rapid Transit Company established a flat 10-cent fare within the city of Chicago at midnight, July 17. The new rate represents an increase of approximately 20 per cent over the former average rate. The restraining order, issued by Federal Judges Carpenter, Page and Wham, sitting *en banc*, prevents the Illinois Commerce Commission from enforcing its recent order denying the elevated lines authority to abolish $1.25 weekly passes and its ticket rate of three rides for 25 cents.

The court overruled the objections raised by the city's representatives that the company should have carried the appeal from the commission's order to the Supreme Court before going to the federal court. In reviewing the commission's order, Judge Page remarked the statement contained therein that "it is unquestionably true that the company is not receiving the full return on its investment which the courts have decided is a reasonable return."

Inasmuch as the injunction is temporary, the company will be required to issue coupons to patrons buying tickets at the new rate of three for 30 cents and to post a bond of $50,000 with which to redeem the coupons in the event the higher fare is finally denied by the federal court. All weekly passes and tickets now outstanding are to be honored until their expiration date.

Following the issuance of the injunction, the court appointed Roswell B. Mason as special master in chancery to hear complete evidence on the rate case.

The issuance of the injunction came as a climax to proceedings instituted by the company before the Commerce Commission last February. The company based its case on a valuation fixed by the commission in 1921 at $94,000,000, including additions and extensions. On that basis, the company asserted that the existing tariffs averaged 8.3 cents per passenger carried and actually resulted in a loss of $6,000 a day by yielding a return of only 2.89 per cent on its investment.

The city opposed the application for a rate increase on the grounds that the valuation was too high, and when the commission denied the petition the company immediately took its case to the federal court, claiming that its property was being confiscated under the existing fare. Evidence of the city's intention of fighting the fare boost before the master in chancery was seen in the announcement of Corporation Counsel Samuel A. Ettleson that he will ask the City Council at once for an appropriation of $250,000 to cover the cost of an independent valuation of the elevated lines' property.

Meeting in Seattle to Discuss New Wage Schedule

In an effort to reach a tentative agreement on recommendations to be made concerning demands of organized employees of the Seattle Municipal Street Railway system, Seattle, Wash., for a new schedule of wages and working conditions for 1929, members of the utilities and finance committees of the City Council will confer with Mayor Frank Edwards. The proposed new schedule, if granted it is said, will add about $200,000 a year to the cost of operating the railway and bus system.

Wages of $150 a month during the first six months of employment, $155 a month during the next six months, and $160 a month after the first year of service are asked for motormen and conductors on two-man cars and all extra men. Seven cents an hour extra for operators of one-man cars and gripmen on the cable lines, and 10 cents an hour extra for drivers of the municipal buses, are among the requests made.

For machinists helpers and car repairmen, a flat wage of $170 a month, with a 44-hour week, is asked, and the same hours also are asked for carhouse shopmen and trackmen, together with a flat increase of $15 a month.

The schedule further asks that all men employed in the railway department be placed under civil service after 90 days of employment; that all overtime be paid for at the rate of time and a half, and that "penalty" time for all split runs be paid for at the rate of 20 cents an hour for the first hour, or fraction thereof and 10 cents an hour thereafter.

Summer Excursion Rates to Los Angeles Beaches

Marked reduction in fares to various beach resorts served by the Pacific Electric Railway, Los Angeles, Cal., have been announced. Under the reduced rates, fares to Santa Monica, Ocean Park, Venice and Palisades del Rey will be 30 cents for adults and 20 cents for children under twelve years of age. A 40-cent fare for adults and 20-cent fare for children will be effective to Long Beach, San Pedro, Seal Beach, Redondo Beach, Hermosa Beach, Manhattan Beach and El Segundo. To south-coast beaches, the saving is 30 cents a ticket and 20 cents to west-coast beach points.

Newsy Sheet in Oakland

Key System Commuter is the name of a new pamphlet 5x7 in., published on the first and third Friday of the month by the Key System Transit Company, Oakland, Cal. Vol. 1, No. 1, under date of July 6, promises "a newsy little publication that is readable and instructive." In its greetings it states, "We want to keep the *Commuter* just as stimulating and fresh as the old Bay breeze. The first issue contains some personal mention items, "ferry" tales, advice to the lovelorn, definitions of success and genius, and even a "woman's column for women."

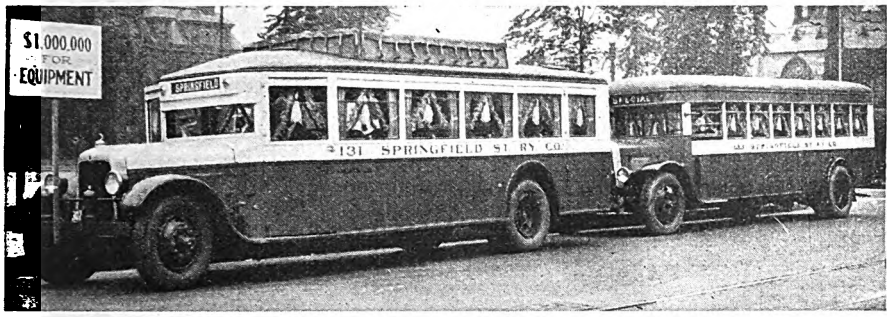
Industrial Parade Prize Won by Springfield, Mass., Road



Some of the new rolling stock shown in Springfield

Three units were entered in the industrial division of the Independence Day Parade at Springfield, Mass., by the Springfield Street Railway, which is spending $1,500,000 in rehabilitation work. Moreover, the company came off a prize winner.

The first unit was one of its new de luxe Yellow coaches used on a line where railway service has been abandoned. Only the interior of the bus was decorated.

The second unit was one of the company's new 33-passenger Z Yellow coaches which will be used in city service. This was decorated in a manner similar to the first unit.

The third unit was a truck showing the modern method of track welding. Here a 5-ton dump truck was used. The sides of the truck were removed and a platform built on it about 14 ft. long and 8 ft. wide. A section of track was mounted on this platform and on each rail were three joints. The first showed the old type channel plate joint. The second showed a welded joint under construction with all equipment on the truck necessary for making the joint. The third showed the completed joint. While the parade was in progress a full welding gang on the truck went through the same operations its members do when actually installing the welded joint. Photographer's flashlight powder placed on a plate in the crucible was touched off every few minutes during the three-mile march, making a flash similar to that in the actual welding operation.

The three units were led by an employee who carried a banner which read: "One and One-Half Million Dollars for Rehabilitation."

A second sign, attached to the de luxe bus, read: "One Million Dollars for New Equipment."

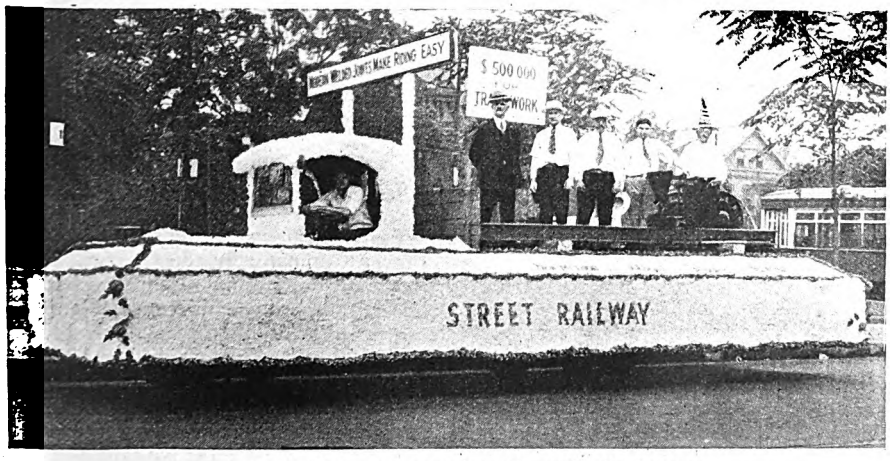
A third sign, carried on the welding display unit, read: "One-Half Million Dollars for Track Work."

Across the top of the truck was a banner which read "Modern Welded Joints Make Riding Easy."

Near the old type of joint was a sign which read "Old Method," near the new joint under construction and also the modern joint completed was a sign which read "New Method" and then a sign reading "Process" was placed near the display showing the joint under construction and another which read "Result" was placed near the completed joint.

A frame was built around the truck, both sides, front and rear and extended out 12 in. from the platform and down to 6 in. from the ground. This, as well as the truck cab, was decorated.

For this last display the railway received first prize, a hammered silver cup 18 in. high for the "Best Industrial Growth Float."



A hammered silver cup was the prize this display won

Wants Iowa Interurban Service Resumed

Petitions have been circulated in Fort Dodge and Webster City, Iowa, requesting the Iowa Railroad Commission to require the Fort Dodge, Des Moines & Southern to resume its interurban service between the two cities. A hearing has been set for Sept. 4. The company announced that adequate transportation was afforded by its two bus routes in the territory. The road is primarily a carrier of freight. The freight service between the cities has not been disturbed.

New Franchise in Dallas for Interurban

A twenty-year renewal of the franchise of the Texas Electric Railway, an interurban, to operate within the city limits of Dallas is embodied in an ordinance now before the City Commission. In the new franchise, provision is made to enable the electric railway to bring in freight cars over its lines from the south, crossing the viaduct and delivering them to its express and freight depot on Jefferson Avenue in front of Ferris Plaza. Because the line from Denison on the north traverses a large part of the residence district, the same privilege of handling freight is not permitted within the city on that division.

The Texas Electric Railway recently was authorized by the Texas Railroad Commission to handle carload and less than carload shipments of freight and in connection with steam railroads intersecting the line the interurban now has freight service between Dallas and practically all intrastate and interstate points. At the present time interurban cars are used in handling freight shipments, but the company plans to purchase several electric locomotives in the future as this new business increases.

Increases in Fares in Stockton and Sacramento

Two increases in fares were granted by the California Railroad Commission on July 11, one for Sacramento and the other for Stockton. Fares in Sacramento will go up from 5 cents to 7 cents and in Stockton from 6 to 7, with four tokens for 25 cents in both cities. The pass has been in use in Sacramento.

The commission found that the Stockton Electric Railroad and the Pacific Gas & Electric Company, owners of the Sacramento system, were not earning reasonable returns on their property and suggested certain operating economies to save approximately $45,000 annually in both places.

Commissioner William J. Carr filed a dissenting opinion. He said:

Increased fares almost invariably drive patronage away. In this critical period fare increases should be avoided if possible. Within the last year this commission has had before it applications for rate increases from nearly every electric railway in the State. As disclosed by these various applications two facts stand out in respect to the street railways. One is that generally the number of passengers carried is not increasing as population increases. The second is that horizontal fare increases or violent rate changes tend to lessen the riding habit.

Digitized by Google

New Rates Suggested in Roanoke

A schedule of revised rates effective Aug. 15 has been filed with the State Corporation Commission by the Roanoke Railway & Electric Company, Roanoke, Va. The company would sell a $1 weekly pass, good for unlimited riding in zone one and would issue a similar $1.50 transferable pass, good on all lines. Tokens would be sold four for 25 cents, but the cash fare would be 7 cents. Round-trip fares from Roanoke to Vinton and to Salem would be fixed at 35 cents under the new schedule.

Cuban Public Utility Tax Reductions

President Machado of Cuba has sanctioned a law reducing railroads' and electric railway companies' taxes to 6 per cent from 8 per cent, and suppressing the municipal tax on public utility companies that pay taxes to the state.

Ordinance Advanced for Acquiring San Francisco Lines

The finance and public utilities committee of the Board of Supervisors of San Francisco, Cal., has approved an ordinance paving the way for acquisition by the city of the systems of the Market Street Railway and California Street Cable Railroad and their eventual consolidation with the Municipal Railway lines. The ordinance to be recommended to the entire board by the joint committee provides for: A survey by the Board of Public Works of the existing transportation system, and proposed unification of all lines. Valuation of the railroad properties by the city engineer and city attorney staffs. Opening of preliminary negotiations by the engineer and attorney for acquisition of necessary lines.

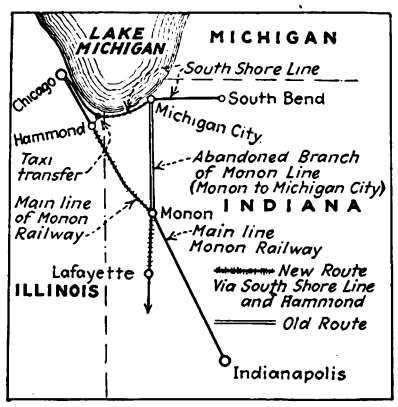
Vote for Arbitration in Toronto

Members of the union of employees of the Toronto Railway, Toronto, Ontario, have decided by a vote of 644 to 25, to require arbitration in their wage demands. At the May meeting, when the union first considered the question of whether the case should go to arbitration, 1,843 members were in attendance.

The executive officers had recommended a renewal of the existing agreement for a further period of two years. As the *Labor Leader*, Canada's National Labor Weekly, put it, they did this, no doubt, owing to the fact that the citizens of Toronto generally feel that the men have been treated fairly by the Toronto Transportation Commission, which operates the railway, and that their wages compare very favorably with any other body of men performing similar work in Canada, and again that the conditions in the labor market generally are not the best at the present time. That paper expressed the belief that the executive officers of the men had the interests of the men at heart and recommended according to their matured judgment.

Co-operation Between Steam and Electric Road in Indiana

Steam and electric railroads are co-operating in the sale of through tickets connecting Indianapolis, Monon and Lafayette, Ind., and other stations of the Chicago, Indianapolis & Louisville Railway and points on the Chicago, South Shore & South Bend Railroad by way of Hammond, Ind., into which city both lines operate. An arrangement effected with the Yellow Taxicab Company of Hammond provides for the free transportation of passengers and baggage in each direction between the local depots of the two lines, which are about ¾ mile apart.



Monon and the South Shore co-ordinate services

The new joint service facilities of the Monon and the South Shore Lines were adopted as a result of the discontinuance in May of all passenger train service between Lafayette, Monon and Michigan City on the Michigan City branch of the former road. Through the efforts of the Michigan City Chamber of Commerce, the two roads were brought together and induced to establish the through ticket arrangement. While the distance between Michigan City and Lafayette is considerably greater by way of Hammond than over the Monon Line's direct route, the difference in fare will be negligible. Four fast trains will be provided daily each way compared with the two locals formerly operated on the Monon branch. The through schedule is so adjusted that connections at Hammond can be made easily and with little waiting for passengers traveling in either direction.

Entire Council in Jacksonville to Hear Franchise Arguments

Negotiations between the City Council of Jacksonville, Fla., and the Jacksonville Traction Company looking toward the compilation of a suitable franchise are to be carried on between a committee of five from the Council, a representative of the city attorney's office and a representative of the company. Citizens interested in the franchise will participate in the sessions. Peter O. Knight, Tampa, Fla., counsel for Stone & Webster interests, suggested that the entire Council discuss the project. He declared he would rather discuss the proposed measure with a committee of Councilmen than with the committee of citizens which prepared a draft of a franchise, stating that the Councilmen were under oath and the committee members were not and were only voicing their own ideas in the matter.

Recently negotiations for a new franchise covering operation of the railway system were suspended pending further investigation of the valuation and other matters by a committee of the Council.

Another New York City Company Seeks Fare Increase

The Eighth & Ninth Avenue Railway, operating the surface lines of those avenues in New York City, filed a new tariff schedule on July 17 with the Transit Commission, fixing the fare effective Aug. 20 at 7 cents. The Transit Commission has indicated that it will refuse to approve the higher schedules.

Seattle Fare Proposal in Prospect

Proposal of a plan to lower Seattle, Wash., car fares with the idea of increasing patronage and revenues will be presented to the City Council in the near future by Councilman Lou Cohen. The plan will be to sell coupon books, giving sixteen rides for $1, with the provision that the book must be used only during the week of purchase. Mr. Cohen declares his plan has the approval of D. W. Henderson, superintendent of the Municipal Railway, and offers it in lieu of the proposal made recently by Roy Furse, Mr. Henderson's assistant, that a $5,000,000 bond issue be floated locally to build 200 new cars and extend city lines. This plan appears doomed to failure. Councilman Cohen says his proposal does not offer any solution to the new car or extension problem, but would improve revenues to a great extent. Tokens would still be procurable at three for a quarter for those not wanting books.

Increased Fare Rates in Rome

Permission was given the Georgia Power Company by the Georgia Public Service Commission recently to increase its railway rates in Rome, Ga., to 8 cents for a single fare and two tickets for 15 cents. School children can buy twenty tickets for 80 cents. This is an increase of 1 cent. Transfer regulations remain the same. The new schedule of rates is effective immediately. The former rate was 6 cents.

Recent Bus Developments

Transfer in Binghamton Approved

The Public Service Commission consented on July 17 to the transfer to the Binghamton Railway Bus Lines, Inc., Binghamton, N. Y., of certificates for the operation of the Triple Cities Bus Lines in Endicott and connecting Binghamton and Endicott and Vestal. The Binghamton Railway Bus Lines is a subsidiary of the Binghamton Railway, and under this order officials of the latter will adjust the bus service with that on the railway lines and transfers will be given between the buses and cars.

Three certificates covering the operation of the bus lines in Endicott and between Binghamton and Endicott and Vestal were originally granted to Edward J. Dorey and later transferred to the Triple Cities Bus Lines. Since 1925, with the approval of the commission, the Binghamton Railway Bus Lines has operated the three bus lines under a lease and recently a contract for the sale of the physical property to the railway bus lines was approved by the United States District Court.

Authorized to Put Buses on Decatur Line

The Illinois Power & Light Corporation's petition to the Decatur, Ill., City Council for permission to remove tracks on its Riverside line in Decatur and substitute bus service has been granted. The city also waived its right, under the franchise grant of 1925, to require the railway to replace its tracks, if, after trial, the bus service proves unsatisfactory.

Would Substitute Buses on Division in Trenton

The Trenton & Mercer County Traction Corporation, Trenton, N. J., has petitioned the Trenton City Commission for permission to substitute buses for cars on the Market and South Warren Streets division.

Franchises in Albany Arouse Opposition

Action by the Albany, N. Y., Common Council on ordinances authorizing two additional bus routes to be operated by the Albany Transit Company in newly developed residential sections has been deferred until Aug. 21. At a public hearing held July 16, opposition developed to the granting of the franchises, both from residents of some of the territory sought to be served and from the Capitol District Transportation Company, a subsidiary of the United Traction Company.

The new routes proposed would deflect a certain amount of patronage from the United Traction Company and its subsidiary bus company which has evinced a willingness to give service over substantially the same routes as that proposed by R. B. Hayes, manager of the Albany Transit Company.

Co-ordination in Cincinnati

City manager says it is desirable but that no disposition exists to hurt present operators

THE proposition of unified transportation in Cincinnati, Ohio, is discussed in a letter sent to City Manager Sherrill, by Thomas L. Tallentire, representing the City Transit Company, operators of a number of bus lines. The letter says in part:

You emphasize the importance of a unified transportation system and predict that this soon will be a reality. While independent bus operation, highly competitive and adverse to the existing street car system, with its bus operation, might be quite undesirable or even detrimental to the interest of the public, this cannot be said of our operations, for the reason that we have studiously avoided any spirit of antagonism or hostile competition. This company has at all times endeavored to provide a service that was not provided by any other agency.

We believe that our company should be given some credit for our endeavors, and I am fearful that your expression of opinion with reference to the desirability of unified operation will tend to affect our system unfavorably. Having previously expressed a desire to co-operate with the city in every way, it appears to us that the investment in both time and money in the present city transit system deserves fair consideration from the city administration.

We believe the continuance of an independent transportation system in this city accompanied with a general co-operative spirit would be beneficial to the city; also that it is debatable whether unification would offer more advantage to the public.

In reply Mr. Sherrill said in part:

My suggestions concerning the consolidation of bus operation were based on the experience of most of the cities of the country, that a well-regulated unified system of transportation is much better for the community as a whole than a number of loosely regulated or unregulated competing lines of systems. This has been recommended by the Beeler organization as one of the conditions precedent to the completion of the rapid transit line, and generally agreed to by engineers who have made studies and surveys of these questions in various cities.

In Cincinnati, where the city has such complete control of the railway system, and where that system can be required to furnish any necessary transportation to any community, it would be especially desirable to have a unification of transportation facilities.

While I believe in the unified transportation system for every city as the best method of providing transportation for the public at large at the minimum cost, and with the best regulation, I still would not suggest any action which would be detrimental to the interest of the various operators of buses or taxicabs. In any legislation that might be suggested by me to the City Council the rights of these operators would be carefully protected. The improvement suggested is one that might be necessary to extend over a period of many years for accomplishment, but it should undoubtedly be ultimately secured.

It seems to me, in view, of your letter, that it might be desirable for the independent bus operators to consider a more equitable disposition of the cost of serving certain sections of the city, and I would suggest that steps might well be taken by the various bus operators to undertake a consideration of these matters in the spirit of co-operation with the city. If a conference could be arranged with all those interested to discuss plans co-ordinating with this service, without any change at present in the existing methods, I feel sure that much good can be accomplished.

This correspondence antedated the unification arrangements to which reference was made in the JOURNAL for June 30, 1928, page 1088.

New Service in St. Louis Started

The St. Louis Public Service Company established bus service into the district lying between West Florissant Avenue and Broadway in the extreme northwest section of St. Louis, Mo., on June 23.

Substitution Likely on Sodus Bay Line

An application for permission to abandon the Sodus Bay line of the New York State Railways has been made by attorneys for the company, in behalf of James Hamilton, president. The stockholders have approved the abandonment of the road. It is said that bus service may be substituted for the interurban cars.

Would Supplant Railway Line in Massachusetts

The Springfield Street Railway purposes to discontinue its railway line on the so-called Birchen Bend route from Chicopee Falls to Indian Orchard, Mass., and substitute a bus service. The company has informed the public officials that the car line is losing money. The bus service would be on an hourly basis.

Extension in Los Angeles

The Los Angeles Railway and the Pacific Electric Railway, operating under the name of Los Angeles Motor Coach Company, have been granted a certificate by the California Railroad Commission to extend the Sunset Boulevard line in the Los Angeles downtown district. Applicants have also been authorized to increase the fares on this line from 10 cents to 15 cents one way and 25 cents round trip between points west of Sunset Boulevard and La Brea Avenue and east of First Street and Vermont Avenue, within twenty days from July 9, 1928.

Financial *and* Corporate

Net Income in Allentown $520,047

The transportation business of the Lehigh Valley Transit Company, Allentown, Pa., continues to decline. The decline in revenue has, however, been retarded somewhat by the rearrangement of car schedules, the application on Oct 9 of increased fares, the adoption of the weekly pass, together with other modifications of former methods which appear to be helpful. The net income for the year ended Dec. 31, 1927, was $520,047, compared to $480,413 for the year ended Dec. 31, 1926. The company's former financial policy and its standard of physical fitness have been maintained. These facts were brought out by P. B. Sawyer, president, in his annual report.

CONSOLIDATED INCOME ACCOUNT OF THE LEHIGH VALLEY TRANSIT COMPANY AND SUBSIDIARY COMPANIES—YEARS ENDING DEC. 31

	1927	1926
Total gross earnings	$4,590,261	$4,950,443
Total operating expenses including taxes	3,367,094	3,710,217
Net earnings from operation	$1,223,166	$1,240,226
Income from interest on bonds	1,067	977
Income from interest on notes and deposits	18,790	28,025
Income from dividends on stocks	109,075	110,075
Total net earnings	$1,352,100	$1,379,303
Depreciation allowance	$243,841	$277,712
Interest—funded debt	567,675	599,585
Amortization of discount and expenses	20,535	21,593
	$832,053	$898,890
Net income	$520,047	$480,413

New bus routes have been established on the lines of the Easton Transit Company to Glendon and West Easton and in the Lehigh Valley Transit territory from Allentown to Nazareth via Bath, making a total of twenty buses now operated over six routes. The bus subsidiary is the Lehigh Valley Transportation Company. In its railway service the company is now operating 281 passenger, freight, and work cars over 202.86 miles of track.

During the year the Wales Junction-Chestnut Hill abandonment has been written off and the depreciation reserve has been reimbursed for the amount written against it to the extent of $500,000 out of net income.

$1,205,104 Available in Los Angeles for Dividends and Surplus

The Los Angeles Railway, Los Angeles, Cal., reports to the Railroad Commission its 1927 operating revenue at $13,287,600, compared with $13,021,482 for 1926. Operating expenses, excluding taxes for 1927, are $11,062,012 and $10,930,998 for 1926, leaving a net operating revenue of $2,225,587 for 1927, and $2,090,483 for 1926. During 1927 taxes charged to operation amounted to $814,347 and for 1926 to $807,925. Deducting the taxes leaves operating income of $1,411,240 and $1,282,558 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income of $1,205,104 for 1927, and $1,080,895 for the year previous.

Stone Mountain Hearing Postponed

Hearing before the Georgia Public Service Commission on the petition of the Georgia Power Company to discontinue service on the Stone Mountain line between Atlanta and Decatur has been postponed from July 24 to July 31. If the request of the company is granted, passengers on the Stone Mountain interurban will transfer in Decatur to cars going into Atlanta, and that part of the line which is now operated between Decatur and Atlanta will be discontinued. Lack of traffic on the division lying between Atlanta and Decatur is given by the company as the reason for requesting the change.

$82,811 Earned by Boston "L"

Public trustees report for year ended June 30, 1928. Commonwealth to receive $895,518 on account of deficit of $3,980,151

THE board of public trustees of the Boston Elevated Railway, Boston, Mass., is about to repay to the commonwealth $895,518 on account of the deficit of $3,980,151 incurred in the first year of public operation. The balance still due to the cities and towns which were assessed to meet this deficit in 1919 is $1,349,333.

The greater part of this payment of $895,518 comes from earnings of earlier years, the actual surplus of receipts over cost of service for the current year ending June 30, 1928, being $82,811.

The amount now available for repayment from earnings of previous years includes among other items approximately $250,000 reserved for taxes, which is no longer required; $400,000 dividend received from the Transit Mutual Insurance Company as well as $146,000 arising out of the adjustment of depreciation because of the change in the estimated service life of buses.

In 1921 the Transit Mutual Insurance Company was organized to carry the Workmen's Compensation Insurance of the railway. The operation of this insurance company has produced substantial savings, and it was felt that in order to provide adequate protection for injured employees and their families no

RECEIPTS AND COST OF SERVICE OF THE BOSTON ELEVATED RAILWAY FOR TWELVE MONTHS ENDED JUNE 30

	1928	1927
Receipts

Average cost of coal consumed, per ton	$4.91	$4.95

Digitized by Google

dividends should be declared until the company had been in business for a sufficient period of time to obtain real experience with reference to the ratio of losses to premiums.

The depreciation upon buses had been computed since the beginning of this type of operation on the basis of an estimated service life of five years. The first buses purchased have already reached that age and are still in service, consequently for the purpose of providing for depreciation the estimated life has been increased to six years with reference to buses purchased prior to Jan. 1, 1928, and has been fixed at seven years upon the later and improved type of buses purchased since Jan. 1, 1928, and the depreciation charge upon all buses owned readjusted accordingly.

This repayment of $895,518 will be distributed by the commonwealth to the municipalities substantially as follows: Boston, $648,446; Cambridge, $87,514; Somerville, $37,843; Brookline, $23,015; Medford, $18,447; Malden, $17,238; Everett, $16,924; Watertown, $12,719; Arlington, $10,026; Chelsea, $9,155; Newton, $8,398; Belmont, $5,787.

For the twelve months ended June 30, 1928, the average receipts per revenue passenger on the Boston Elevated Railway were 9.629 cents. Cost of service was 9.606 cents per revenue passenger, divided as follows: labor, 4.628 cents; interest on bonds and notes, 0.702 cents; rent on subways and tunnels, 0.624 cents; rent of leased roads 0.866 cents; coal, 0.301 cents; depreciation, 0.774 cents; damages, 0.328 cents; material and other items, 0.890 cents; taxes 0.493 cents.

Indiana Deal Nearing Completion

Final steps under way by which Terre Haute, Indianapolis & Eastern and subsidiaries will be merged with Central Indiana Power as Central Indiana Power Corporation

STOCKHOLDERS of the Terre Haute, Indianapolis & Eastern Traction Company will meet at Indianapolis, Ind., on Aug. 1 to consider plans for the proposed merger of the company's properties with the Central Indiana Power Company, an Insull concern. This meeting served to focus attention again on a deal that has been pending for many months and attended with many vicissitudes for the interests which have been seeking to bring to a workable basis the divergent views of those that would be affected. Only a few weeks ago Halsey, Stuart & Company, New York, readjustment managers, filed an amended plan and agreement. The plan, in short, provides for the readjustment of securities, consolidating the Central Indiana Power Company and subsidiaries and the Terre Haute, Indianapolis & Eastern Traction Company and certain subsidiaries into the Indiana Electric Corporation. Here are the terms for the exchange of securities as modified:

(1) In lieu of Indiana Central Rapid Transit Company first mortgage 5 per cent bonds, the holders of Indianapolis & Northwestern Traction Company first mortgage 5 per cent bonds and the holders of Indianapolis & Martinsville Rapid Transit Company first mortgage 5 per cent bonds and the holders of Indianapolis Crawfordsville & Danville Electric Ry. first mortgage 5 per cent bonds are to be entitled to receive preferred stock, series A, of Indiana Electric Corporation, exchangeable on the basis of one share of stock for each $100 of bonds.

(2) In lieu of 5 per cent cumulative preferred stock of Indiana Central Rapid Transit Company, holders of Indianapolis & Northwestern Traction Company 5 per cent cumulative preferred stock and holders of Indianapolis Crawfordsville & Danville Electric Railway 5 per cent cumulative preferred stock are to be entitled to receive preferred stock, series B, of Indiana Electric Corporation, exchangeable par for par.

(3) In lieu of an equal par amount of Indiana Electric Corporation participating adjustment preferred stock, the holder of each share of Terre Haute, Indianapolis & Eastern Traction Company 5 per cent cumulative preferred stock shall be entitled to receive three-quarters of a share of Indiana Electric Corporation adjustment preferred stock.

(4) In lieu of one share of Indiana Electric Corporation participating adjustment preferred stock for each 10 shares of Terre Haute, Indianapolis & Eastern Traction Company common stock, holders of such common stock are to be entitled to receive Indiana Electric Corporation adjustment preferred stock exchangeable on a basis of three-quarters of a share of adjustment preferred stock for each 10 shares of common stock.

Here is the description of the new preferred stock of the Indiana Electric Corporation:

Series A.—This stock will have a par value of $100 per share. It will be entitled to receive after paying or setting aside for payment the dividends on all stock of senior rank, cumulative dividends, payable quarterly at the following rates, viz.:

For 1929 and 1930, 2 per cent per annum; for 1931 and 1932, 3 per cent per annum; for 1933 and 1934, 4 per cent per annum; for 1935 and thereafter, 5 per cent per annum. This dividend schedule is based upon completion of consolidation as of Dec. 31, 1928.

Series B.—This stock will have a par value of $100 per share. It will be entitled to receive after paying or setting aside for payment the dividends on all stock of senior rank, cumulative dividends, payable quarterly at the following rates, viz.: For 1929 and 1930, 1 per cent per annum; for 1931 and 1932, 2 per annum; for 1933 and 1934, 3 per cent per annum; for 1935 and 1936, 4 per cent per annum; for 1937 and thereafter, 5 per cent per annum. This dividend schedule is based upon completion of consolidation as of Dec. 31, 1928.

Series A and series B of the preferred stock is to have equal rank in all other respects and be preferred as to dividends and assets at par over the adjustment preferred stock and common stock of the Indiana Electric Corporation. It will not be entitled to participate in subscriptions for any additional shares of stock of whatever class thereafter issued, and will be subject to redemption at the option of the company at any time at $100 per share. In the event the quarterly dividend is not paid in full for four dividend periods, then the holders of stock on which dividends shall not have been paid together with the holders of other shares then voting, have full voting rights, each share thereof being entitled to one vote. Such voting rights of preferred stock and each series thereof shall continue until dividend payments have been resumed. Series A and series B of preferred stock will be subject in all respects to the preferences and priorities of such other classes of preferred stock, except the adjustment preferred stock, as may now or hereafter from time to time be authorized.

The adjustment preferred stock of the Indiana Electric Corporation has been described in part as follows:

This stock will have a par value of $100 per share. It will be entitled to receive in or for any year out of the company's net earnings during such year available for the payment of dividends after paying or setting aside for payment the preferred dividends on all stock of senior rank, noncumulative dividends, payable quarterly at the following rates, viz.: For 1930 and 1931, 1 per cent per annum; for 1932, 2 per cent per annum; for 1933, 3 per cent per annum; for 1934, 4 per cent per annum; for 1935, 5 per cent per annum; for 1936 and thereafter, 6 per cent per annum. No dividends are to be paid in or for the first full year of operation, which, for the purposes of the foregoing schedule is assumed to be the year 1929. No dividends are to be declared or paid in or for any year upon the common stock unless or until dividends at the foregoing rates shall have been declared and paid or set apart for payment upon the adjustment preferred stock. The adjustment preferred stock will be subject to redemption at the option of the company at any time at $100 per share. In the event that quarterly dividends in accordance with the schedule of rates above stated shall not be paid in full for four consecutive dividend periods, then the holders of the adjustment preferred stock shall, together with other shares then voting, have full voting rights, each share thereof being entitled to one vote. Such voting rights of the adjustment preferred stock shall continue until dividend payments have been resumed as required by the foregoing provisions.

The common stock of the Indianapolis & Northwestern Traction Company, Indianapolis & Martinsville Rapid Transit Company and the Indianapolis Crawfordsville & Danville Electric Railway are to be exchangeable under the provisions of the plan for the common stock of the Indiana Central Rapid Transit Company if and when such a corporation is formed. If it should be deemed desirable and advantageous by the manager to change this provision of the plan and not create the Indiana Central Rapid Transit Company, or to create it and not merge any of the three companies above named into it, then the common stocks of the three companies are to remain as now the property of the Terre Haute, Indianapolis & Eastern Traction Company and pass to the Indiana Electric Corporation upon merger.

The preferred stock, series A and B, is

Digitized by Google

a new provision of the plan not heretofore been set forth in the plan and agreement. The provisions as to the adjustment preferred stock are in lieu of all provisions relative to the stock described as participating adjustment preferred stock in the plan.

It is the judgment of the readjustment manager that the other securities of senior rank included in the plan and agreement, dated July 1, 1927, are not adversely affected by the amendment thereto hereby made.

Mississippi Interurban Would Abandon Service

Efforts by the Mississippi Power Company to discontinue interurban service between Laurel and Ellisville, Miss., have resulted in an order by the Ellisville Mayor and commissioners for a general election on Aug. 14, at which qualified voters will be asked to decide whether the company franchise will be cancelled. The line is 7 miles in length.

The two towns connected are about 30 miles north of Hattiesburg. If the Ellisville citizens agree to the abandonment the company expects to ask Laurel to hold a similar election. The company says the line is not self-supporting.

Another Move in Indianapolis & Cincinnati Reorganization

Hearings have been held by the Public Service Commission of Indiana on petitions for authority for the Southeastern Indiana Power Company and the Indianapolis & Southeastern Railroad to purchase the power property formerly owned by the Indianapolis & Cincinnati Traction Company, asking approval of the purchase by the Southeastern Indiana Power Company of the power property of the Indianapolis & Cincinnati Power & Light Company, and asking authority for the Southeastern Indiana Power Company to issue $600,000 in bonds, $400,000 in preferred stock and $200,000 in common stock to finance the transaction.

The applications are all made in connection with the plan to segregate the light and power business of the old Indianapolis & Cincinnati Traction Company from the railway and are in accordance with the plan of the new owners who bought in the system at foreclosure and have it in mind to conduct the railway under the corporate title of the Indianapolis & Southeastern Railroad and the power property under the corporate title of the Southeastern Indiana Power Company.

Olean Equipment for Sale

Equipment formerly owned by the Olean, Bradford & Salamanca Railway, Olean, N. Y., now being dismantled, is offered for sale. Inspection of material may be made on the ground at any time after July 24. Besides a number of cars and car equipment, material on hand includes substations, electrical and track equipment and miscellaneous pieces. M. B. Serfas of Olean and Hazleton, Pa., is dismantling the road.

Southern Pacific After Visalia

The Interstate Commerce Commission has been asked to authorize the Southern Pacific to acquire control by lease of the Visalia Electric Railroad, Robertson Boulevard, Chowchilla, to Dairyland Farms subdivision, a distance of 10.2 miles, and certain rights-of-way. The total mileage operated by the Visalia is 72.29 miles standard gage. The road does not parallel and is not competitive with the Southern Pacific.

The Visalia Electric Railroad, operating in Exeter, Visalia and vicinity, reports to the California Railroad Commission its 1927 operating revenue at $181,998 compared with $188,941 for 1926. Operating expenses, excluding taxes for 1927, are $108,323 and $95,386 for 1926, leaving a net operating revenue of $73,675 for 1927, and $93,554 for 1926. During 1927 taxes charged to operation amounted to $13,950 and for 1926 to $15,064. Deducting the taxes leaves operating income of $59,724 for 1927, and $78,490 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, (which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus), of $60,338 for 1927 compared with $79,487 in 1926.

Would Discontinue Illinois Line

The Illinois Power & Light Corporation has filed a petition seeking authority to discontinue interurban service between Ottawa and Streator, Ill. It is the claim of the petitioners that since the hard road was opened the interurban service is operated at a daily actual loss. The railway may continue the Streator branch as a freight line.

Maturity of Pittsfield Bonds Extended

Bonds of the Pittsfield Electric Street Railway, the payment of which were assumed by the Berkshire Street Railway in 1910 in connection with the purchase of the Pittsfield Company property, became due on July 1 of this year. They have a face value of $300,000. The maturity of these bonds has been extended for a period of ten years by an agreement which has just been approved by the Massachusetts Department of Public Utilities. The rate of interest is reduced from 7 to 6 per cent.

Municipal Road in Massachusetts to Quit

The municipally-owned Norton, Taunton, Attleboro & Mansfield Street Railway, operating in Massachusetts, is due to cease operation on July 22.

Directors of the controlling corporation, who are the Mayors of Taunton and Attleboro, and the chairmen of Selectmen of Norton and Mansfield, met on July 13 and took the formal steps to bring about the end of the road. Bus service has been arranged by all of the communities.

Attleboro will get service from the Interstate Street Railway by bus from Monument Square to the Attleboro-Norton line. There the passengers will have to change since Norton officials failed to give the Interstate Company the right to go into the town.

The Foxboro-Mansfield Bus Company has been authorized by Norton to go to the Attleboro line and also to come into the town from Mansfield. The Eastern Massachusetts Company of Taunton has the right to operate from that city to Norton.

The road was taken over about five years ago from the private owners by the municipalities served and has since been run under a pooling arrangement among the communities served.

Illinois Line to Be Sold

The Illinois Central Electric Railway, operating 26 miles of single track, will be sold at public auction at its headquarters in South Main Street, Canton, Ill., on July 25 by W. H. Fouts of Lewistown, Ill., master in chancery for the Fulton County Circuit Court. The First National Bank, Canton, Ill., as trustee under a bond issue, is foreclosing on the railway's property.

Des Moines Sale Declared Certain

Sale of the Des Moines City Railway, Des Moines, Ia., under receivership, became a certainty when the receivers failed to tender to the clerk of the United States District Court $1,800,000 to retire the outstanding indebtedness of the company, as required under a decree. The sale probably will not be made until Sept. 1, due to the fact that a notice must be published.

Eleven Mile Suspension in Pennsylvania

Permission to abandon service on 11 miles of line has been granted to the Northwestern Electric Service Company by the Pennsylvania Public Service Commission. The company operates an electric railway from Erie through Meadville and Harmonsburg to Exposition Park on Conneaut Lake. The portion of the line on which it is intended to suspend service is between Meadville and the park.

The Meadville-Exposition Park section was considered separately because the State Highway Department proposes to improve a portion of the line between those points. Relocation and reconstruction of the company's tracks would approximate $52,437. On the section to be abandoned total revenue in the year ending May 31, 1928, was $18,140 and expenses were $26,488.

Personal Items

H. H. Bailey's Duties in Tennessee Broadened

H. H. Bailey has recently been appointed superintendent of production of the Tennessee Electric Power Company, with headquarters in Chattanooga, Tenn. For the past several years Mr. Bailey has been superintendent of production of the Nashville Railway & Light Company, a subsidiary of the Tennessee Electric Power Company. In his new position he will still maintain supervision over the power plant of that company, which is operated as a part of the Tennessee Electric Power Company's system.

Mr. Bailey is a graduate of Ohio State University, and has had a number of years' experience in power plant designing, construction and operation. At the time of his transfer from Nashville, he was president of the Engineering Association of Nashville. He is a member of the Tennessee State Board of Architectural and Engineering Examiners, associate member of the American Society of Mechanical Engineers and of the American Institute of Electrical Engineers.

William Stewart Advanced at Omaha

William Stewart, private secretary to J. N. Shannahan, president of the Omaha & Council Bluffs Street Railway, Omaha, Neb., has been elected to the position of assistant secretary and assistant treasurer of the company. This promotion became effective on June 26, 1928. Mr. Stewart has been in the railway field since 1899 when he became identified with the New York Central & Hudson River Railroad at Albany, N. Y. Since that time, as told in ELECTRIC RAILWAY JOURNAL issue of Feb. 11, 1928, he has been associated with several railway companies, holding the positions of secretary, purchasing agent and treasurer.

F. D. Comerford Elected in Providence

Frank D. Comerford, Boston, president of the New England Power Association, was elected president of the Rhode Island Public Service Company on July 12 at Providence. The Service Company controls the United Electric Railways and the Narragansett Electric Company. As indicated in ELECTRIC RAILWAY JOURNAL issue of June 30 Mr. Comerford's election was expected. He succeeds Luke C. Bradley, who resigned recently to accept a position with the Electric Bond & Share Company of New York.

At a meeting of the directors of the United Electric Railways on July 12, Mr. Bradley handed in his resignation from the board. Louis C. Gerry was elected to the position. Mr. Bradley also resigned as vice-president of the company, but no one was elected to fill the vacancy.

A. S. McArthur Made General Superintendent at Toronto

No better criterion is afforded of the increased responsibilities of A. S. McArthur with the Toronto Transportation Commission than the accompanying revised organization chart showing how the duties are divided among the officials responsible for the conduct of the railway and the buses of the municipal enterprise at Toronto, Canada. Mr. McArthur is now functioning as general superintendent of the commission, reporting to D. W. Harvey, the general manager.

A. S. McArthur

To the post he now holds Mr. McArthur was appointed on June 15 last. For three years before that, 1925-1928, he was superintendent of the garage department of the commission. Prior to that he was for two years, 1924-1925, assistant superintendent of the bus department of the commission, responsible for co-ordinated service on a scale probably larger than that of any other comparable community.

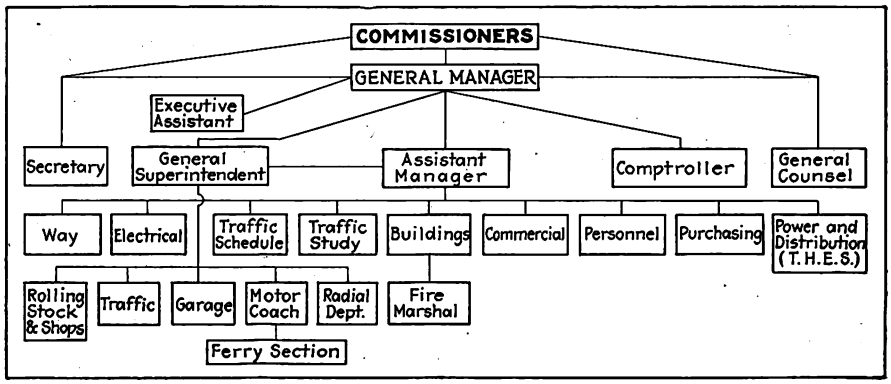
These, of course, are facts, but they shed very little light on the work of the man himself or his fitness for the post he now holds. It was his record in these posts, however, that led to his selection as general superintendent, for the titles he formerly held do not adequately indicate the extent of the work he did or contain a clue to the quality of the service he rendered in these positions. To his new position Mr. McArthur brings the technical qualifications of the engineer, reinforced by a wide experience in management. Part of this he obtained in directing, on his own account, following his service with the Canadian forces in the World War, a large farm to which he applied modern methods with men and machinery. Having done this, the urge to return to a field more nearly akin to his technical qualifications became irresistable. It was then he returned to the Toronto commission, the predecessor of which he had served from 1912 to 1914 as resident engineer of the Toronto Civic Railway, the lines of which were merged with those of the Toronto Railway when that private enterprise was taken over by the city.

Mr. McArthur was born on June 4, 1888, at Quebec. He attended Model School, Upper Canada College, and was graduated from the University of Toronto in 1911 with the degree of B.A.Sc. From the time of his graduation until 1913 he served as a dominion land surveyor.

S. Ray Shelby Renamed Commissioner

Sidney Ray Shelby has been reappointed a member of the Pennsylvania Public Service Commission by Governor Fisher. The term is for ten years from July 1, subject to confirmation by the state Senate next winter.

Mr. Shelby was first appointed a commissioner by former Governor Sproul on Feb. 11, 1919, to fill an unexpired term of ten years. He was ranking member of the commission and during the absence of Chairman William D. B. Ainey was acting chairman. With the exception of the period in 1925, when Governor Pinchot attempted to displace Mr. Shelby and James S. Benn, he has held office in the commission continuously since his orig-



New chart of organization of Toronto property

Digitized by Google

inal appointment. The re-appointee came into the limelight with Commissioner Benn in 1925 when Governor Pinchot centered on them the blame for a ruling to which he took exception. Messrs. Benn and Shelby refused to recognize the dismissal by the Governor and carried their case to the Supreme Court, which reseated them in a decision which held that the Senate was the sole appointing power.

Appointments Made to Harbor Belt Line Railroad

George F. Squires, formerly assistant freight traffic manager of the Pacific Electric Railway, was unanimously chosen general manager of the Harbor Belt Line Railroad, Los Angeles, Cal., by the board of control, and his appointment has been approved by the board of operation. Mr. Squires is 35 years of age and has been engaged in railroad work for the past twenty years, covering practically every department.

James W. Mee, formerly general agent for the Pacific Electric Railway at Los Angeles harbor, was appointed joint terminal agent and assistant to general manager.

C. B. Nelson, formerly special accountant for the Southern Pacific Company at San Francisco, was appointed auditor.

G. C. Beaumont, formerly assistant chief engineer of the Los Angeles & Salt Lake Railroad of the Union Pacific system, has been selected as terminal engineer.

B. M. Billhardt, formerly with the auditing department of the Pacific Electric Railway, was appointed treasurer.

On May 1, Mr. Squires began the preliminary work in the formation of an organization which will unify into one consolidated operating agency the railroad facilities of the city of Los Angeles, Southern Pacific Company, Los Angeles & Salt Lake Railroad and the Pacific Electric Railway at Los Angeles Harbor, Cal. Control of this road is vested in a board of control and a board of operation composed of representatives of the aforementioned organizations.

Obituary

E. B. Katté

Edwin Britton Katté, chief engineer of electric traction for the New York Central, prominently identified with the development of electricity in heavy railroad work in the United States, died on July 19 after an illness of more than a year. He was in his 58th year.

Mr. Katté had been in active charge of electrification at the New York terminal since that work was begun and so had a great deal to do with the design of the equipment. As an expert on the electrification of terminals he was called into consultation for the Detroit Tunnel and for terminals at Cleveland and Chicago. For several years he was consulting electrical engineer of the Cleveland Union Terminals Company.

Detroit Track Improvements May Reach $1,500,000

Detroit Department of Street Railways, Detroit, Mich., has under way an improvement program estimated to cost between $900,000 and $1,000,000, all of which will have to be paid for by the department out of earnings, since the proposal that the D.S.R. be relieved of the expense of paving between tracks was voted down by the electors of the city. This total estimated amount may be augmented by a loan of $500,000 from the city of Detroit if a plan providing for the loan, which has been under discussion, is approved by the City Council and the Street Railway Commission. In event the plan is approved, it is proposed to use the additional money to finance laying new tracks on Grand River Avenue between Meyers Road and Redford Street, and for paving between tracks.

The existing tracks on Grand River Avenue between Meyers Road and Redford Street are owned by the Detroit United Railway and are now being rented by the city at an annual cost of $76,000. There is no pavement between tracks or on either immediate side, which results in a loss of approximately 30 per cent of the road width, and this fact, together with the condition of the tracks, are cited as making the improvement necessary. The present tracks will revert to the city with the expiration of the D.U.R. franchise next month.

It is proposed, should the Council loan the D.S.R. the half million dollars, to get the work under way without delay on the 10 miles of new tracks and the paving between rails. The $76,000 now being paid to the D.U.R as rental would be applied to repaying the city and it is estimated that the D.S.R. would benefit by reduced operating costs and savings to the rolling stock equipment.

General Electric Bookings Larger

Operations of General Electric Company in the second quarter of this year ran slightly ahead of those in the previous three months and in the corresponding period of 1927. Earnings, in consequence, for the first half of the year probably will show a small improvement over the first six months of last year when net income of $23,830,162 after all charges, including depreciation and federal taxes, was equivalent to $3.12 a share on 7,211,481 no-par common shares outstanding, after allowance for dividends on special stock.

First quarter bookings totaled $79,925,840, an increase of 3 per cent over the corresponding period in 1927, and 4 per cent over the quarter ended Dec. 31, 1927, when bookings amounted to $76,708,532. Billings were about 1 per cent smaller than in the three months ended March 31, 1927, and totaled $71,640,790, while net income of $11,905,487 to March 31, after charges, this year showed a small gain.

The enhancement in net income, in the face of smaller billings in the first quarter this year against the corresponding three months of 1927, resulted principally from greater "other income" rather than from further economies in operations.

$900,000 Dallas Improvement Plan Adopted by City

A program of extensions, improvements and betterments to cost approximately $900,000 during the next three years has been proposed to the Dallas Railway & Terminal Company by the Mayor and Board of Commissioners. John W. Everman, supervisor of public utilities, prepared the report which was adopted by the city officials. The items in the Everman plan No. 4 heretofore agreed upon and not completed are:

Extend Junius Heights line, Ridgeway to Llano	$56,093
Rebuild Collett Avenue, Columbia to Gaston	25,405
Install negative return feeder to serve North Dallas substation	895
Reconstruct and repave Commerce Street, H. & T. C. to Exposition	16,095
Install underground cables on Willow Street, East Dallas substation to Pacific Avenue	6,145
Purchase one new bus, two new chassis and rebuild two bus bodies	4,560
Track rearrangement at Fair Park, removing Parry Avenue tracks and replacing same to Fair Ground property	25,860
Total	$135,045

New work to be included in Everman plan No. 5 is given in the following:

Purchase seventeen new Peter Witt cars	$245,480
Rebuild and convert fourteen cars to one-man operation	21,000
Cole Avenue, double track and pave	109,795
Vickery line—purchase same, double track and pave McMillan	66,065
Peak, Ross to Munger, pave	12,000
South Lamar Street, rebuild and pave	51,585
Cockrell Avenue, Burnett to Alma, repave	7,035
Fairview, Grand to Culver, pave	5,725
Capital, Haskell to Kirby, pave	6,670
Capital, Fitzhugh to Henderson, pave	5,495
Seventh Street and company right of way, rebuild and pave	6,025
Edgefield, north of Davis, build passing track	5,000
Total	$541,875

SUMMED UP IN THE FOLLOWING:

Unfinished Everman Plan No. 4	$135,045
Everman plan No. 5	541,875
Add replacement job orders covering maintenance over and above franchise 18 per cent R., M. and D.	216,000
Grand total	$892,920

It is understood that the seventeen new Peter Witt cars will be ordered immediately, so as to get them ready in time for the Fair, that all unfinished

items on Everman plan No. 4, amounting to approximately $135,000, shall be completed in due time, that fourteen cars shall be rebuilt and converted to one-man operation, and that a bus line on Ewing Avenue, between Jefferson Avenue and Montana Street, shall shortly be placed in operation. Westinghouse and General Electric 140-hp. motors and type M multiple unit controls are used.

Pacific Electric Rebuilds Cars

Five electric-motor passenger coaches, eight electric operating trailer passenger coaches and five electric-motor combination passenger and baggage coaches were recently purchased by the Pacific Electric Railway, Los Angeles, Cal., from the Southern Pacific Railroad. The cars will be remodeled into eleven passenger coaches, six parlor car type passenger coaches and one business car, all to be electric-motor driven.

The cars are all of the same type, being 46 ft. 10 in. long and 9 ft. 5 15/16 in. wide and will weigh, when complete with motors, approximately 104,000 lb. The miscellaneous furnishings and articles to be purchased include illuminated destination signs, flush type toilets, Ohmer fare registers, parlor car type seats and dome type ceiling lights.

Track Extension Considered in Seattle

Officials of the Seattle Municipal Street Railway, Seattle, Wash., are giving close scrutiny to the available resources of the department to determine if there is any way to provide an extension of the car line serving Beacon Hill. Residents of that district have petitioned the city to extend the line a half mile from Beacon Avenue and Spokane Street to Columbian Way, and the South Beacon Hill Improvement Club offered its resources in helping to finance the extension. Other residents of the district have asked that the line be extended 1 mile. The whole matter has been referred to the Street Railway Department for recommendation.

Obsolete Industrial Equipment to Be Studied

The Department of Commerce is about to undertake a requested study of industrial equipment. One objective of this study, which will be conducted by the Domestic Commerce Division, under immediate direction of H. C. Dunn, is to determine the amount of obsolete equipment and its importance as a factor in the inability of firms manufacturing similar products to compete on an equally profitable basis. The replacement of machinery which in point of service may have many years of useful-

Specifications on 50 Cleveland Cars

Fifty one-man, two-man passenger cars for city service are being built for the Cleveland Railway, Cleveland, Ohio, by the G. C. Kuhlman Car Company, Cleveland. The cars are single-end, double truck, motor, of the Peter Witt type.

Each car is 53 ft. 6½ in. long, 8 ft. 6 in. wide, weighs 44,800 lb. and seats 55 passengers. The body is of semi-steel construction with arch roof and doors in both center and end. The finish is in enamel, orange exterior with interior trim in mahogany.

ness but which in point of satisfying the latest fancies of the consumer market is obsolete, is an important matter for the manufacturers. A sample survey will first be made to develop the plan of procedure and to learn what obstacles must be overcome.

Lamont Chairman of International C. of C.

Thomas W. Lamont, a member of the firm of J. P. Morgan & Company, has been appointed chairman of the American Committee of the International Chamber of Commerce, succeeding Owen D. Young, who had served as chairman for the last three years. Silas H. Strawn, of Montgomery Ward & Company, Chicago, was appointed a member of the Council with Robert E. Olds, former Undersecretary of State, as alternate. Charles F. Weed, vice-president of the First National Bank of Boston, has also been named a member of the American Committee.

Lift Truck Simplification Approved

A general conference of manufacturers and users of skid platforms and lift trucks, hand and power, held recently at the Department of Commerce, under the auspices of the Division of Simplified Practice, approved a proposed simplified practice recommendation for the dimensions of lift trucks and skid platforms.

The conference passed resolutions that two standard dimensions, 8 in. and 12 in., be adopted for under-clearance of skid platforms; and that "the minimum clearance between runners or supports of skids be not less than 29 in." In addition the conference went on record as favoring the establishment of standard dimensions for over-all length and width of skid platforms, with the proviso that there be two standards, one to be such that this size of skid can be placed three abreast in a freight car, and the other the same length as the first skid, but twice the width.

TRACK AND LINE

PORTLAND ELECTRIC POWER COMPANY, Portland, Ore., is asking that the city share in the expense of reconstructing railway tracks made necessary by the widening and improvement of certain points of Larrabee Street by the city. The company points out that the present trackage was laid in 1918 at a cost of approximately $20,000 and that the proposed new work would cost an additional amount, reaching probably $19,000.

CALGARY MUNICIPAL RAILWAY, Calgary, Alberta, will lay a double-track line on Center Street from Seventh Avenue to Sixteenth Avenue, with the installation of a double-Y loop at the intersection of Center Street.

NOVA SCOTIA LIGHT & POWER COMPANY, Halifax, Nova Scotia, has signed an agreement with the City Council permitting the company to run its railway through Point Pleasant Park to Murtello Tower.

CORTLAND COUNTY TRACTION COMPANY, Cortland, N. Y., will make extensions in its transmission system.

TACOMA MUNICIPAL BELT LINE, Tacoma, Wash., has been authorized by the City Council to construct a single-track extension in Taylor Way, south 3,500 ft. from Lincoln Avenue, to furnish service to the Tacoma Electro-Chemical Company. The line will cost $12,000.

WORCESTER CONSOLIDATED STREET RAILWAY, Worcester, Mass., has started reconstruction of 550 ft. of double track on Salisbury Street. This job is estimated to cost $6,100 and will require a special curve, 25 tons of 7-in. 103-lb. girder rail, 600 ties, 8 kegs of spikes, 800 Lundie plates 30 thermit joints and 200 flat "T" rods.

SHOPS AND BUILDINGS

NEW YORK CENTRAL RAILROAD, New York, N. Y., has awarded contracts to Merritt, Chapman & Scott, Inc., New York, for the construction of an additional intake at Glenwood power station, Yonkers, N. Y., and to Miller-Blyth, Inc., New York, for the construction of a substation at Philipse Manor, N. Y.

MISSISSIPPI POWER COMPANY, Gulfport, Miss., plans to build a substation.

KANSAS CITY PUBLIC SERVICE COMPANY, Kansas City, Mo., has completed plans and specifications for the construction and installation of an elevator and conveyor to be used in transferring coal from a dump pit to the boiler room at the Tenth and Lister Street shops. The approximate cost will be about $2,000, and authority for its installation will be requested. Plans have also been completed for the construction of an incinerator, to be used for burning refuse from shop and cafeteria.

ALABAMA POWER COMPANY, Birmingham, Ala., plans an automatic substation at Holt, Ala.

TRADE NOTES

AMERICAN BRAKE SHOE & FOUNDRY COMPANY, New York, has announced the appointment of Maurice N. Trainer and Edward Barrett Smith as assistant vice-presidents, reporting to William S. McGowan, vice-president in charge of the eastern and southern sales department.

ELECTRIC SERVICE SUPPLIES COMPANY, Philadelphia, Pa., recently accepted the exclusive selling rights to passenger transportation companies of Rayflectors manufactured by the Atlas Manufacturing Company.

YELLOW TRUCK & COACH MANUFACTURING COMPANY, Pontiac, Mich., has increased its board of directors to fifteen members. Additional directors elected are G. A. Green, P. H. Geyser, L. Ruthenberg and H. J. Warner, all officials of the company.

W. J. STANTON, formerly with the Ohio Brass Company, was elected vice-president and treasurer of the Cuban-American Manganese Corporation with offices at 120 Broadway, New York.

Boston Has Reason to Be Proud!

NEWS of progress in the operation of the Boston Elevated Railway under public control is always interesting. So, when the board of trustees, on July 17, repaid $895,518 to the Commonwealth on account of the deficit of $3,980,151 incurred in the first years of public operation completed just ten years ago, Boston has cause to stop, look and listen. The balance still due from the road to the cities and towns served which were assessed in 1919 to meet this deficit is $1,349,333.

General Manager Edward Dana naturally is enthusiastic over the condition of the road under the management of the public trustees, particularly since the greater part of this payment of nearly $1,000,000 comes from the earnings of previous years, and the actual surplus receipts over the cost of service for the current year ended June 30, 1928, were $82,811.

And Mr. Dana has real reason to be proud. When the public control act was passed, the trustees, in taking over the management of the road, incurred an actual deficit of nearly $5,000,000 the first year, since the $1,000,000 reserve fund was depleted that year. Not since then has there been a deficit. In the ten years just concluded the trustees have restored the $1,000,000 reserve fund and have made total repayment of $2,630,818 in liquidation of assessments of $3,980,151 against cities and towns served by the road.

With the exception of the repayment in July, 1923, the payment just made is the largest. In that year it was $1,114,557. Since 1923 only $103,000 has been repaid. The amount made available for repayment this year includes, among other items, approximately $250,000 reserved for taxes which are no longer required; $400,000 of dividends received from the Transport Mutual Insurance Company, as well as the adjustment of depreciation because of the change in the estimated service life of buses.

Incidentally the company's handling of the technical question of bus depreciation is of much interest. The depreciation of buses, it was explained by Mr. Dana, has been computed on an estimated service life of five years. This plan has been changed, as many of the buses have seen more than five years of service and consequently the adjustment has been made on the estimated life of six years. This is important since there has been so much discussion of the question of whether there was a disposition among railway men to penalize the bus by writing off the vehicle too quickly. All new buses purchased by the company have been rated with a service life of seven years and the depreciation charges of all buses owned by the company have been readjusted accordingly.

In the report on the receipts and cost of service for the twelve months ended June 30 a decrease over 1927 was noted in the receipts from fares. In the last twelve months total receipts were $35,009,933, about $600,000 less than the year before. On the other hand, the total cost of service was $34,927,121, leaving a favorable surplus of $82,811 in excess of receipts over cost of service, while in 1927, despite the greater fare revenue, the excess cost of service over receipts was $76,599. The summary of the operations of the company for the year ended recently, published in the JOURNAL for last week, makes plain the reason for the pardonable pride which Mr. Dana takes in the showing. As matters now stand the trustees have rounded out their ten years of service, the full period of the original lease, and have been able to meet expenses and to turn back a large part of the money which was borrowed from the municipalities early in the period.

A Determined Chief Executive

MEANWHILE Governor Fuller has doggedly stuck to his determination that the Legislature do something about the Boston Elevated Railway. When the attempt to extend the period of public control failed at the regular session he convened the legislators in a special session and admonished them that they might be kept in session all summer. But the public appears to have become exhausted over the matter. Either that or its representatives felt they had their say during the regular session. At any rate the public was conspicuous by its absence at the recent public hearing. Since there was not much else left for them to do under the circumstances, the legislators retired with all the evidence and documents garnered previously, and the special committee appointed in response to the Governor's special message has now reappeared with a series of three measures which it has reported in the Senate.

The committee would appear to have proceeded along lines that lead to the ends which the Governor has sought—the continuation of the period of public control with a reduction in dividends on the common stock, the appointment of a committee to study the question of further rapid transit extensions and a plan to construct an extension of the Boylston Street subway. The measures to this end were passed by the Senate on July 10. What will happen now is, of course, a matter of conjecture. The real fight is expected in the House.

At the regular legislative session the matter was bedeviled by differences of opinion among four factions. One, momentarily the strongest, was for complete public ownership; a second and generally strong faction was for public control; a smaller faction was for return of the road to private control; the fourth included the legislators who were "on the fence" and who came, in large part, from districts far from Boston and took no particular interest in Elevated legislation. If the attitude of the trustees of the Elevated is properly understood their position on the question of rapid transit extension

Digitized by Google

is that the cost should be borne, to a major extent, by the taxpayers or persons whose real estate holdings are benefited, and to a minor extent by the car riders.

Even making allowance for the terror of his utterance, there is much justification for the Governor's unmistakable show of impatience. It was his idea that to waste time talking about private ownership was to do nothing and that it was futile to talk about public ownership, since that is impossible at present. As he sees it, a continuation of public control leaves the way open in either direction, but furnishes means for providing facilities and improvements needed now. If this be true, then the Governor's strictures are justified. In this connection the comment of the Boston *Transcript* seems to be sound that if there had existed in the general court a strong, united desire to start, and to start now, a program of rapid transit improvements for metropolitan Boston, members of the House and Senate could have smoothed out the disagreements which divided them into hostile and opposing factions, each urging different financial plans.

New Need for Skip Stops Results from Changed Conditions

WHEN the so-called "skip-stop" system was first introduced on the electric railways of this country during the war, the underlying idea was to reduce energy consumption and thus save coal. With the ending of the war the need passed and the old stops have since been restored by many companies. In some instances this has been done by driblets and in other instances by a general return to the old plan. Probably about two-thirds of the stops once eliminated have been restored. Now, however, comes a new urge for skip stops. Traffic congestion in cities large and small is having a serious effect on the speed of operation. At the same time people have become accustomed to riding in automobiles and demand rapid service in public transportation vehicles. One of the best ways to accomplish this appears to be by a reduction in the number of stops.

Usually it is in a city's intermediate belt, partly residential and partly commercial, that the greatest opportunity lies for the elimination of stops. In the center of the city, stops are to be found at almost every street intersection, but the number of people using each stop is so great that any considerable reduction in their number would cause serious inconvenience. In the outlying regions stops usually are spaced fairly far apart. Moreover, the need for making stops here arises less frequently than in congested districts. But in the intermediate zone there is a stop at practically every corner, and nearly all of these stops have to be made on every trip. A reduction in the number of stops in this area undoubtedly would make possible a substantial increase in the speed of railway operation.

Elimination of stops is not now primarily a matter of saving money for the railway, but rather of giving more attractive service. It means depriving a limited number of people of a minor accommodation for the benefit of the majority of the traveling public. Those who may have to walk short distances probably will not like it. Some merchants will protest. The railway manager, however, cannot let the objections of a few individuals stand in the way of a service improvement for a far larger number. The problem is one of education and of reconciling public opinion to sacrifice by the few for the benefit of the many. It may not be easy to do this, but the watchword of the day is "speed" in transportation, and skip stops are one way to accomplish this end.

More Than the Poppy Comes Out of China

OUT of the East comes another of those ideas in the management of local railways hardly applicable to roads in the Occident, but no less interesting on that account. A while back the Turk ruled against the onion eater on the trams in Constantinople; now from China comes the news that the Peking tramway, having begun to pay a small profit for the first time in its three-year history, will be called upon by the government to contribute to the upkeep of 30 primary schools. Thus is the governmental snooper, about whom no end of jibes has been made, ever on the alert, even in the Orient.

As he reads the sayings of Confucius in the classroom in Peking, the future member of the On Leongs of New York or San Francisco probably will not cogitate upon the source from which his textbook is supplied, but the accountant of the railway, particularly if he is a native, will probably be very cautious about the financial statement of his company, conscious of the code of China which puts a price on the head of the next of kin where the culprit flees after a crime is committed and discovered. Meanwhile those of us in the Occident who had thought that the very limit had been reached in the ability of governments to devise new avenues of taxation will ponder the ingenuity of the silk-robed, leisurely Chinese official with his ways of approach less agile than his Western counterpart but no less efficacious. Others will cogitate on the story of Charles Lamb on the origin of roast pig.

Anyway, the news from China comes as a corrective to the notion, so frequently conveyed by the daily press, that the length of the imagination of the Chinese is confined to revolutions incited by the Bolshevik influence and to emigrating to America and running a laundry, selling chow mein or trafficking in the pollen of the insidious poppy. There have been pipe dreams before in newspaper offices in the United States in which narcotics have not played a part. Perhaps this new tax plan story is one of them. Anyway, it is to be hoped so. With all due respect to the Chinese, the tax gatherers in the United States need no help from them. Already they are too alert for comfort.

Instilling a Desire for Self-improvement

SELF-IMPROVEMENT is what has differentiated man from animal. The transportation worker is no different in this respect from anyone else. Given the opportunity to improve, the great majority will grasp it. The man who has the desire to develop is trying to make himself a better workman on today's job as well as planning for the job ahead. Not only is that the best way to obtain recognition and the opportunity for promotion but it gives the individual a sense of satisfaction that comes only from work well done.

As a rule the employee has few opportunities for learning how to do his own work better, save by his own efforts in performing it. The rudiments of any partic-

Digitized by Google

ular task are usually taught by someone slightly more familiar with it than the beginner, but there the matter ends. On a few large properties, notably the Boston Elevated Railway, the Milwaukee Electric Railway & Light Company and the Philadelphia Rapid Transit Company, the opportunity has been presented to employees in all departments for learning the underlying reasons for the work they are doing and also the relation of their own work to that of others.

In particular in some of the courses of study offered by the Philadelphia Rapid Transit Company, outlined in an article in the JOURNAL for July 14, will it be seen that these courses are general in character and yet they bring a much fuller appreciation not only of the transportation business as a whole, but that part of it with which those taking them are directly concerned. That there was a real desire for the various courses on the part of the men is evidenced by the enrollment of some 4,000 during the first year they were offered.

Practical educational programs are received enthusiastically wherever they are offered. They assist the men to attain the highest standard of performance on their own jobs and to visualize where their work fits into the complete industrial program. They do more than this—they instill a greater desire in the employees for self-improvement.

Shifting the Burden of Proof

WERE proof needed that elimination of parking reduces vehicle congestion and increases street capacity, plenty is available in the comparative figures obtained in Chicago before and after the no-parking ordinance went into effect last January. Recent checks compared with those made a year ago on typical week days show an increase in vehicles entering and leaving the Loop in a twelve-hour period from 241,820 to 275,977. This is an increase of 34,157 vehicles or 14.1 per cent. In the same period there was an increase of only 10.6 per cent in the number of automobiles registered in the city, and when the count was taken this year business was quiet as compared with last year. Moreover, the traffic observed in the 1928 count was not up to the limit of capacity of the streets.

Even more surprising was the effect on street car schedules. The time needed to traverse the Loop was decreased 15 to 25 per cent and the movement of individual cars was much more uniform on account of the absence of delays. Cars can keep more closely to schedule, so that the spacing is better both inside and outside the central business district. Thus the effect of elimination of parking in a very restricted area is felt more or less throughout the entire city.

As to the effect on the merchants, according to their own reports many more people are coming to two of the largest stores by automobile than before the change. This should dispel the fear so often expressed that the merchants will be ruined by elimination of the parking privilege. Of course, a little arithmetic should show that it is possible to provide parking space on the streets to care for more than a small fraction of the persons who enter the stores, but to a skeptic nothing is so convincing as the facts developed from actual experience.

The results in Chicago should have a great significance all over the country. If parking can be eliminated in the Loop with such excellent effects there seems to be no reason why adoption of a similar restriction should not work equally well everywhere. The tests should be studied by traffic men generally all over the country. Now that the plan has been proved feasible, the burden of the proof should be on those who are opposed to elimination of the familiar rows of automobiles cluttering up the main thoroughfares, rather than on those who would free the streets of them.

Obtaining Maximum Benefit from Traffic Reports

NO USE is made of many of the city improvement plans prepared at considerable effort and expense. What is true of general city improvement programs has been true also of many of the city traffic surveys made recently. Occasionally the cost of the proposed improvements is too great; less often are the plans impracticable. Programs that are really worth while are, however, abandoned in deference to private, selfish interests. It is unfortunate for the general good of any city when those in authority have to protect either their own interests or those of others. While many public-spirited officials desire to consider the citizens first, the organized interests are able to press their claims much more loudly and effectively than the unorganized general public. As a result, many city improvements and traffic relief measures, elaborately planned and much needed, have failed of accomplishment.

The recommendations made on the basis of actual data obtained in the course of the survey and worked out after mature deliberation are the most valuable part of such a report. They are the remedies prescribed for specific ills and as such should receive the greatest consideration. Although at times fanciful and impracticable proposals have been made, most of the recommendations in reports of this character have been suitable and have been worthy of adoption. However, a check-up would reveal that comparatively few of the proposals have been put into effect without serious modification. In view of the need for traffic relief and the necessity for effective city planning which prompt such surveys, it is almost unbelievable that so many of the reports are filed away and forgotten so quickly without having received proper consideration.

Conflicts of public and private interests, such as those of an official who drives his automobile to work and parks it on the street all day, or the one who owns a business on a street a block away from the one for which relief is being planned, must be considered. The official who has pet schemes of his own and wants to adopt them in preference to those of the report must be shown that it is to his advantage to go along with the general plan. As long as the decisions are left to a few they will be made to please a few. It is only by intensive selling of the ideas embodied in the report to the public that a general insistence upon the passage of the neecssary ordinances will result. In other words, unless a popular demand for the adoption of the recommendations can be made they are likely to fail. Often what is needed is merely greater knowledge of the recommendations by the general public, and the development among the people of champions who will fight for the recommendations until they are adopted. In the instances where this has been done the maximum benefit has resulted.

New Traffic Code Recommended for Boston

Erskine Bureau after extended survey urges reduction in street parking, improved signs and signals, establishment of street traffic engineering division and more stringent penalties for traffic violations. Means for facilitating traffic movement at street intersections are analyzed

FOLLOWING more than a year of investigation and study of the Boston Street traffic situation, the Albert Russel Erskine Bureau of Street Traffic Research of Harvard University has presented an extended report. The report was prepared under the direction of a special board of public officials and representatives of business organizations appointed by the Mayor to consider the problem. This board invited the Erskine Bureau, of which Dr. Miller McClintock is director, to conduct the survey, and the city made an appropriation to meet the expense of the work.

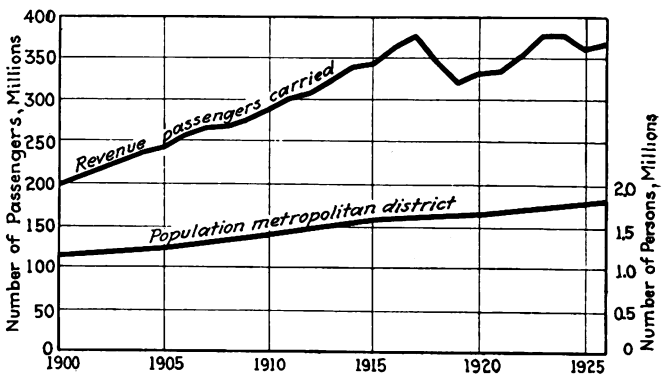
Briefly, Dr. McClintock's recommendations may be divided into three parts: The first relates to keeping the streets more clear. This can be done, he says, by a reduction in the time occupied by pavement repairs, the space taken by street openings and the storage of building materials; by the relocation or elimination of electric railway service on short sections of a few narrow streets downtown, by a better location of taxicab stands, and by a reduction in the amount of automobile parking. The second recommendation related to better control of existing traffic, both vehicle and pedestrian, and included the introduction of better route signs and traffic signals and the establishment of a new traffic code. The third recommendation covered the subject of future administration. It proposed increased authority to the Board of Street Commissioners over traffic and the establishment by them of a division of street traffic engineering; the organization of a Metropolitan Boston Traffic and Safety Conference, representing all of the towns concerned; the establishment by the police of an automobile traffic division, an increase in authority in traffic matters of the Police Department, and more stringent penalties for traffic violations.

Some Features of the New Code

In the proposed traffic code, red, green and amber signal lights are recommended. When both amber and red show, the crossing is for the exclusive use of pedestrians. At intersections where there is no police officer or traffic signal, a pedestrian within a clearly marked cross-walk has the right of way, provided he indicates his intention to cross by holding up his hand, the palm toward approaching traffic.

In connection with street cars, the code provides that operators of other vehicles shall not drive through a safety zone. If upon street car tracks elsewhere, they must leave as soon as practicable after a signal from the street car operator. They shall not stop, stand, or park a vehicle (except when necessary to avoid conflict with other traffic, or in compliance with the direction of a police officer or traffic sign or signal) between a safety zone and the adjacent curb, or within 20 ft. of a point on the curb immediately opposite the end of a safety zone.

The code lists a large number of streets and parts of streets where parking is prohibited except for three minutes to load and unload passengers or materials. Another clause designed to prevent night storage prohibits parking on any street for more than two hours between the hours of 1 a.m. and 7 a.m. On some streets time parking is permitted. In another list are the streets



Total revenue passengers carried by Boston Elevated Railway and population of Boston Metropolitan District

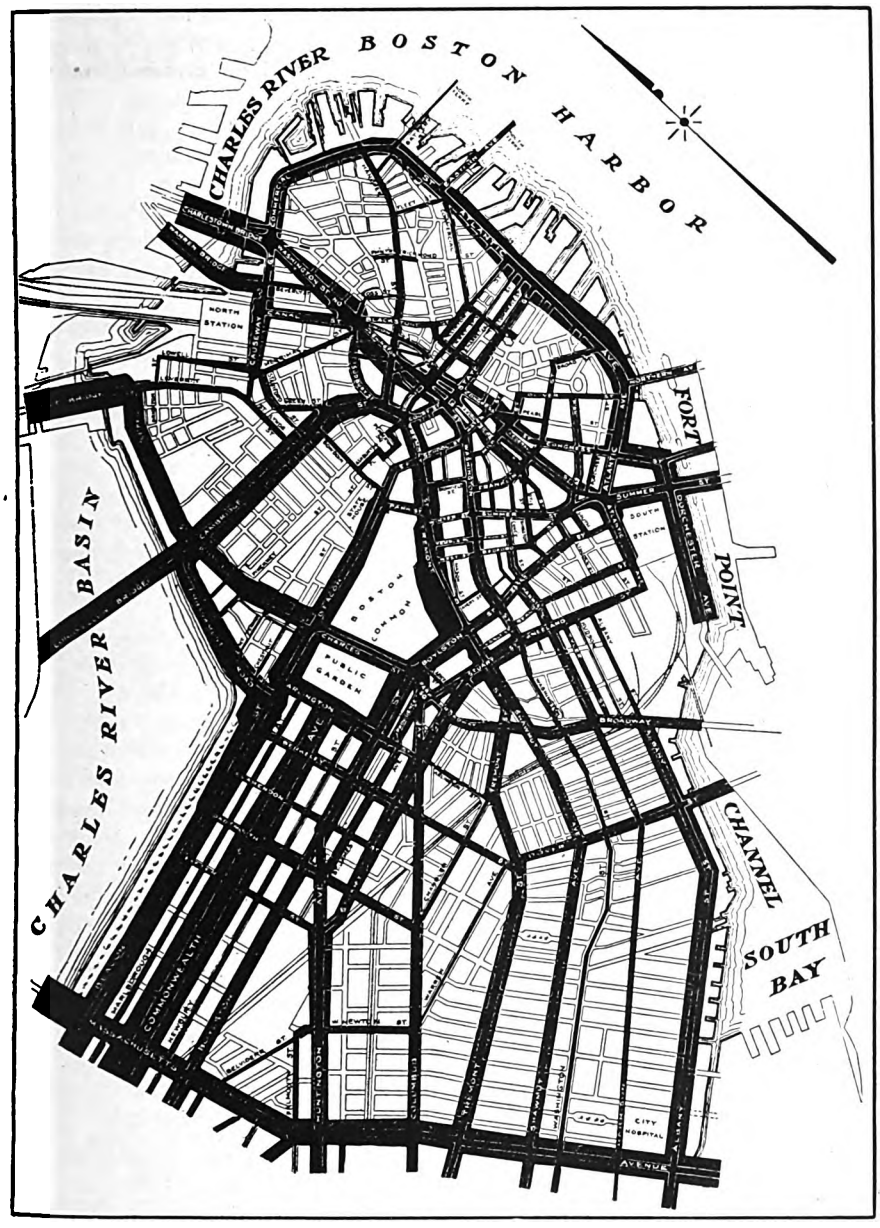
where there is to be no delivery of material or collection of refuse between 8:30 a.m. and 5:30 p.m. No vehicle designed or used primarily for advertising may be operated upon any through street nor in any business district.

For ordinary violations of the parking laws the report recommends a modified "tag" system. Under the present plan of tags and complaint cards issued by officers, a large number of offenders escape for one or another reason. Under the suggested plan, a separation would be made between serious traffic offenses and those resulting from ignorance or carelessness of a non-criminal character. The latter would be dealt with through a special bureau and not through a court, or if undertaken by the latter, full court procedure would not follow except with frequent offenders.

Organization and Methods of the Survey

While the survey was undertaken primarily to consider the problems of the city of Boston, it was considered necessary to devote some study to the metropolitan region, though no recommendations were made regarding traffic control outside of the city. The metropolitan region thus considered, including the city, has a population of 1,808,845, within which are registered 307,127 automobiles.

Digitized by Google



Vehicular flow in downtown Boston, 1927

The problems within the city are complicated somewhat by the winding, disconnected and narrow streets in the downtown section, though the fact that the streets are natural arteries gives some advantages not possessed by cities laid out on a rectangular plan. The city is fairly low in proportionate area devoted to roadways in the central business district, as shown by the accompanying table:

PROPORTIONATE AREA OF CENTRAL DISTRICT DEVOTED TO ROADWAYS

	Per Cent		Per Cent
Washington, D. C.	44	Minneapolis	30.5
San Diego, Cal.	41	Detroit	29.5
Cleveland	39.5	Chicago	29
Seattle	37.5	Denver	27.5
St. Louis	37	Salt Lake City	25.5
San Francisco	34.5	Boston	25
Portland	34.5	Toledo	25
Pittsburgh	34	Los Angeles	21.5

The growth of population in Boston and in its metropolitan region has not been so rapid as in some American cities but shows a definite upward trend. The center of business and commercial activity tends to remain fixed, as in other American cities, whereas the workers and purchasers tend to become more widely distributed. This means increased traffic and transportation requirements, as shown by the chart giving the rise in population and revenue passengers carried on the Boston Elevated Railway since 1900. The vehicular flow in downtown Boston is illustrated in the accompanying map.

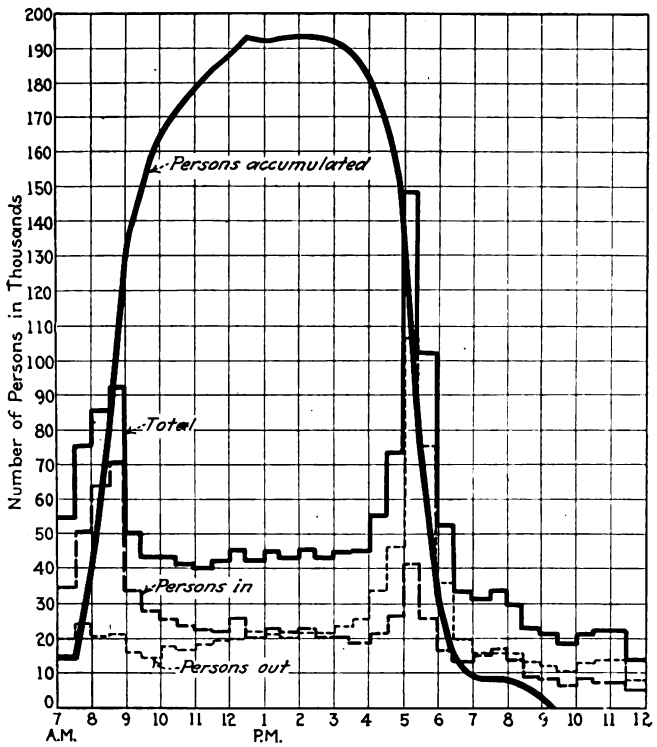
Boston's business district is near the center of the original community development, but because of its zoning law the city has very few tall buildings. With certain exceptions there are no structures of more than approximately thirteen stories. This height limit has undoubtedly tended to spread business activity and to a degree has aggravated, rather than relieved, street congestion by adding to the requirements for street use in inter-communication between various establishments. This should not be taken, however, as an argument for the relaxation of the existing limit. Boston is far from having attained a general approach to the height limit permitted. When an average height of thirteen stories is approached, the central district will have a capacity and transportation problem many times beyond that which now exists.

Three accompanying charts show the fluctuation in traffic in Boston's downtown district on a typical week day (June 28, 1927). The first shows half-hourly fluctuation and accumulation of persons entering and leaving the inner cordon of downtown Boston by all modes of transportation from 7 a.m. to 12 p.m. The second chart shows half-hourly fluctuation of passenger automobiles, trucks and teams entering and leaving the same district, and the third the persons entering and leaving by mass transportation on the street. The peak loads, especially in the third chart, are very noticeable. The report declares that before long serious consideration must be given, both in Boston and in other large cities, to a suitable staggering of the work hours in office buildings, theaters and commercial establishments.

Control of Special Street Uses and Obstructions

One of the recommendations, as already explained, is a reduction of street openings, due to pavement repairs, as they are considered a serious obstruction to travel. The report recommends that where parking is prohibited on either one or both sides of the street, no permit shall be issued for street openings for repair to sub-surface utilities between 7 a.m. and 6 p.m. on any day except Sundays and legal holidays, though for emergencies a permit may be granted, provided the force works continuously until the repair has been completed. Where parking is limited to one hour or less, the appli-

Digitized by Google



Half-hourly fluctuations and accumulation of persons entering and leaving the inner cordon of downtown Boston by all modes of transportation, 7 a.m. to 12 p.m., June 28, 1927

cant for the permit should maintain at least two shifts of eight hours during each 24 hours.

Much can be done in the way of limiting the time that stores materials and merchandise may be left on the roadway and sidewalk.

The survey showed that approximately 55 per cent of the taxicabs on the street are empty, due largely to cruising. While the more frequent abuses of cruising are subject to control, entire elimination of cruising would defeat one of the primary purposes of the cab, which is to make transportation quickly available. Much can be done to better location of taxi stands and in other ways. Transfer of the time assigned for the receipt and delivery of much of the merchandise to between 6 p.m. and 6 a.m. was urged. The tracks used by the Boston & Worcester electric freight cars could well be transferred to less congested streets.

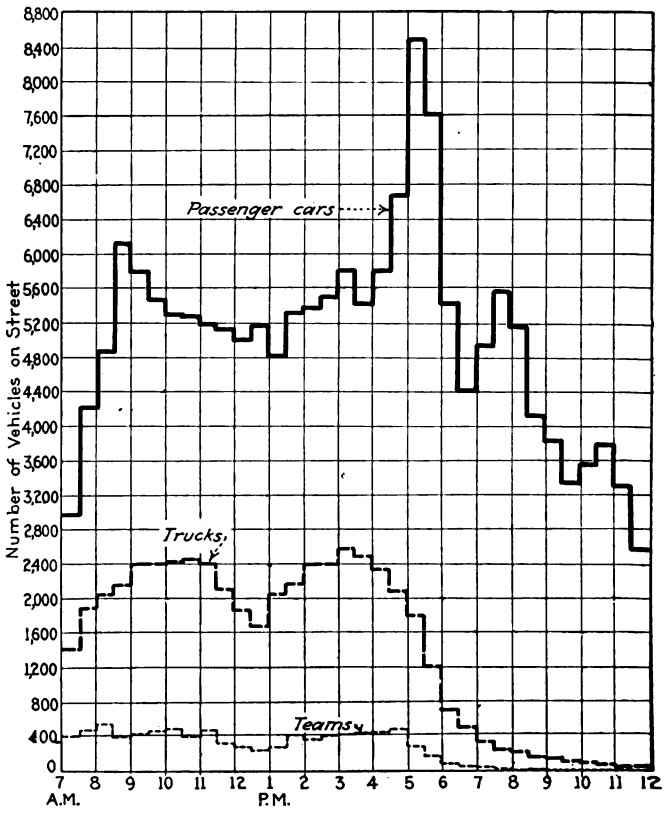
The Parking Problem

Many violations of parking regulations were studied in the central business district. Of the 20,600 parked vehicles recorded 5,964 were on streets where parking is prohibited. The average time requirement for parking in the central business district was revealed to be 41 minutes for all types of cars, including both those occupying prohibited spaces and those occupying spaces where parking is permitted for one hour only. In addition to time limits and prohibitions, present regulations specify certain restrictions in parking. The study reveals that Boston operators are careless in their observation of these regulations also. Of 30,925 vehicles checked in all districts, 9,698, or approximately one-third, were found to be improperly parked. Parking at an improper angle was the most frequent offence. The next most frequent type of violation was leaving the car too far from the curb. Cars parked nearer than 20 ft. from the street corner made up the next violation in order of number. It was found that 571 cars were violating the regulation prohibiting parking within 10 ft. of a hydrant, and 1,116 violated the regulation in regard to double-line parking.

Parkers may be divided into three classes: long-time parkers, short-time parkers, and live parkers. The survey showed that those who parked for four hours or longer constituted 0.9 per cent in the central retail district, 2.8 per cent in the wholesale district, 1.3 per cent in the office district, and 2 per cent in the Park Square and Boylston Street district. The survey does not look with sympathy upon long-time parking, as it limits the parking space available to the short-time parker and live parker. These classes have a more legitimate connection with business activity. The short-time parker is represented by salesmen, callers upon banking establishments or offices or wholesale houses, and the patrons of retail establishments. They frequently have to make calls at various points within a limited district and would find greater difficulty in utilizing a garage for each call than would the all-day parker in storing his car once for an entire business day. A one-hour limit is recommended as the maximum for parking where parking space is limited.

The live parking group is composed primarily of the drivers of private vehicles who are waiting for a passenger of the car to transact business and return. From the standpoint of safety and convenience, such a car with a competent operator is much less objectionable than any unattended car as it can easily be moved in an emergency. Live parking can be permitted at points where any other kind of parking should be prohibited.

A survey of the means used by patrons to reach ten large retail stores in Boston was made for the entire day of Nov. 4, 1927. Each patron received a ballot; 220,000 ballots were distributed and 56,681 were returned in such form as to be suitable for classification. The records in per cent in Boston as compared to Chicago and San Francisco, are given in an accompany-



Half-hourly fluctuations of passenger automobiles, trucks and teams, inner cordon of downtown Boston, 7 a.m. to 12 p.m., June 28, 1927

Digitized by Google

ing table. The percentage using automobiles, 14.3, is large for a city with a rapid transit system, according to Dr. McClintock.

RETAIL PATRONS' MODES OF TRANSPORTATION COMPARED, PER CENT

City	Public Carriers	Walked*	Automobile Garage	Automobile Curb
Chicago	72.5	19.5	6.4	1.6
San Francisco	60.2	21.8	6.9	11.6
Boston	62.0	23.7	6.6	7.7

* Includes those walking from suburban trains.

As the present curb capacity is practically reached, the Retail Trade Board of the Boston Chamber of Commerce has undertaken to encourage parking in downtown garages by providing bus transportation between these garages and the principal shopping district. The bus line thus put into operation has carried nearly 25,000 shoppers within two months and the service is increasing constantly in popularity.

Pedestrian Protection by Raised Car Platforms and in Other Ways

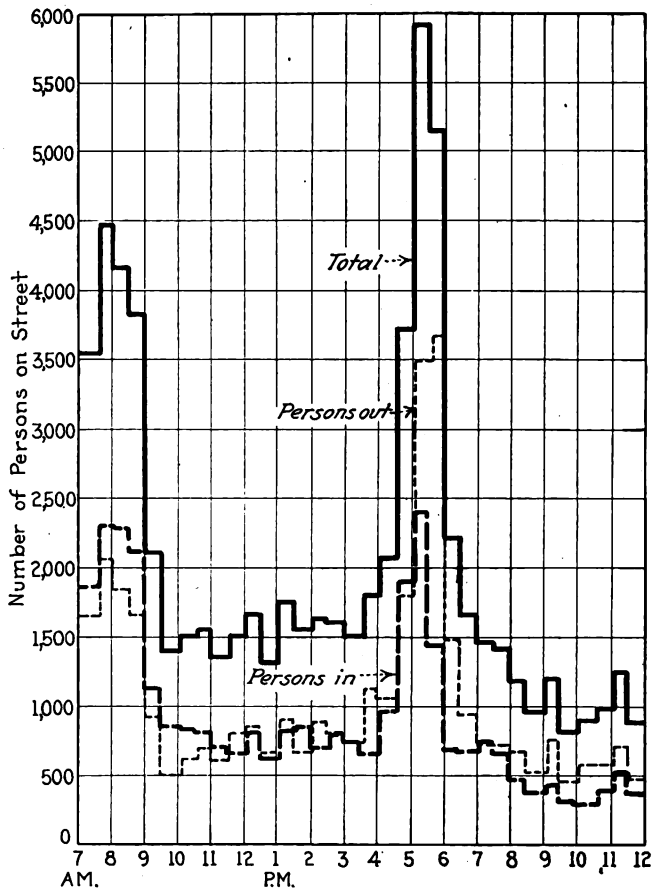
The primary traffic problem in the principal retail streets, the report says, is pedestrian protection and convenience. For this reason special attention was given to these problems.

Unfortunately, Boston not only has very narrow roadways but also unusually narrow sidewalks. At some points, for extended periods, from one-quarter to one-half of the total pedestrian movement is forced to use the roadway, to the discomfort and danger of those who do so.

Sidewalk congestion has been increased in the past because of the subordination of pedestrian requirements to the vehicular traffic at street intersection traffic control. The normal tendency of intersection officers is to favor the vehicular requirements, inasmuch as blocks of this class of traffic are more apparent than delays to pedestrians. The effect is a series of unreasonably long waiting periods at intersections during the time vehicular traffic is flowing. It is believed that the great majority of conflict between pedestrian and motor vehicles results from a confusion which is inevitable under present operating conditions. So long as motor cars are run over unprotected thoroughfares, the heaviest legal responsibility upon drivers will never be adequate to avoid frequent accidents, unless reasonable standards of self-protection are established for pedestrians.

As a suitable protection for pedestrians in the outlying districts, there is need for a fuller use of pedestrian safety zones at car stops along heavily-traveled ways. Preferably such zones should be of a raised platform type with a bulkhead of sufficient size on the traffic end to give actual and complete protection to pedestrians who may use it. It is unnecessary to say that such a zone should be properly illuminated so that it may not become a hazard to vehicular traffic. Where such physical protection at car stops cannot be given, due to the character of the location or the expense involved, protection should be sought by the establishment of safety zones marked by paint lines and illuminated signs, or through the use of traffic buttons with suitable reflecting devices. Such protective zones offer a desirable protection in wide streets or in the center of squares.

As a first step in the creation of a balanced system of rights and responsibilities between pedestrians and drivers, the survey recommends the adoption of a regulation giving pedestrians an unqualified right of movement across normal street intersections. The form of such right of way is indicated in the early part of this article.



Half-hourly fluctuations of persons entering and leaving inner cordon of downtown Boston by mass transportation, 7 a.m. to 12 p.m., June 28, 1927

The report does not recommend prohibiting pedestrians from crossing between street intersections. Under normal conditions such a prohibition is desirable, but it is thought hardly practicable in Boston because of the narrowness of the sidewalks. So the recommendation is made that between street intersections the vehicle has the right of way, though this does not relieve the driver from the exercise of due care for the safety of pedestrians.

The Position of the Street Car

In discussing the relation between street cars and motor vehicles, the report says that street cars suffer from automobile obstruction, because running upon fixed routes they cannot be maneuvered to avoid vehicles in their paths. On the other hand, drivers of motor vehicles are handicapped by street car movement, since these latter units must stop periodically for the purpose of picking up and discharging passengers.

The overtaking of street cars by automobiles presents two requirements. In the first place, the movement should be under such conditions as to give full safety protection to passengers boarding or leaving such cars. In the second place, where possible, a maximum freedom of movement to pass standing cars should be permitted to vehicle drivers to relieve the obstruction to traffic which this operation otherwise necessitates.

The state law which requires that drivers passing stopped street cars shall not come within 8 ft. of the running board or lowest step of the car, except at the

Digitized by Google

express direction of a traffic officer or at points where passengers are protected by a safety zone, hardly gives sufficient protection for passengers boarding and alighting. A better provision would be that approved by the National Conference of Uniform Traffic Ordinances and Regulations. It is expressed as follows:

The operator of a vehicle overtaking any street car stopped or about to stop for the purpose of receiving or discharging any passengers, shall bring such vehicle to a stop, to the rear of the nearest running board or door of such street car and remain stationary until any such passenger has boarded such car or reached a place of safety, excepting that where a safety zone has been established, a vehicle need not be brought to a full stop before passing any such street car, but may proceed past such car at a speed not greater than is reasonable or proper, and with due caution for the safety of pedestrians.

Another regulation necessary because of the impossibility of street cars changing their course of travel to avoid traffic obstruction on their track is:

It shall be unlawful for the operator of any vehicle proceeding upon any street car tracks in front of a street car upon a public street to fail to remove such vehicle from the tracks as soon as practicable after signal from the operator of said street car.

To avoid accidents at intersections, the survey recommends the following provision:

When a street car has started to cross an intersection no operator of a vehicle shall proceed on the car track in front of the street car.

The overtaking of street cars to the left is filled with such hazard as to make the following section desirable:

The operator of a vehicle shall not overtake and pass on the left any street car proceeding in the same direction, whether actually in motion or temporarily at rest, when a travelable portion of the roadway exists to the right of said street car. The above provision shall not apply to one-way streets.

The desirability of safety zones has already been mentioned. As they are at those points where drivers may normally expect to find pedestrians standing in the roadway, there should be a definite community habit that motor vehicles should never be operated in such reserved spaces. To make this practice a part of the regulations, the following provision should be included:

It shall be unlawful for the operator of a vehicle at any time to drive the same over or through a safety zone as defined in these regulations.

Street cars as well as motor vehicles should cause as little obstruction as possible to travel. The officials of the Boston Elevated Railway should consider the elimination at route ends, of all layovers which necessitate the standing of street cars in important traffic ways for any period of time beyond that reasonably necessary to load and unload. This point can be covered by the following provision:

No directing officer or operator of any steam or street railway train or car shall operate or cause the same to be operated in such a manner as to prevent the use of any street for purposes of travel for a period of time longer than five minutes, except that this provision shall not apply to trains or cars in continuous motion.

Turning Movements

The principal intersection confusion at the present time results from turning movements. The left turn is the more complicated of the two. The right turn, though less confusing, offers interference to following traffic and necessitates the crossing of a pedestrian lane under conditions where the pedestrian is presumed to have a clear opportunity to cross. At controlled intersections, right turns should be made only on a positive signal to proceed, given either by the police officer or by the signal device. Normally, right turns should be made on a "go" indication, releasing all traffic in that general direction of movement. If, at special intersections, it becomes desirable to hold general through traffic movement during intervals when right turns should be made, a green arrow pointing in the direction of the right turn should be part of the traffic signal equipment. The right turn always should be made entirely subject to the rights of pedestrians who may be crossing on a "go" signal. The same general provisions for the safety of pedestrians should apply to the left turn as to the right. Left turns should be made at controlled intersections only on specific direction to proceed and subject to the rights of pedestrians moving with the least traffic.

Type of Signal Recommended

The type of signal best suited for general control purposes has three colored lenses, red meaning "stop," green meaning "go" and amber meaning "wait." Some cities have thought it desirable to eliminate the amber signal, but it has a utility in advising drivers moving toward a street intersection that makes it possible to stop before entering. It advises drivers waiting for release at an intersection that they are about to receive a "go" signal, and it has a special utility in warning pedestrians. A further argument for the retention of the amber light is to be found in the necessity of many of the more crowded intersections to provide special pedestrian intervals. In the past, this has been accomplished successfully by the showing of a combined amber and red light. The survey recommends a continuation of this practice.

In signals to be installed, those of the progressive coordinative type are recommended.

"No Parking" Works Well in Chicago

Checks show marked increase in total number of vehicles entering Loop district. Surface Lines saves 25 per cent in running time

EXPERIENCE with the no-parking restriction which went into effect on Jan. 10 in the Loop district of Chicago, points clearly to the success of the experiment. Two of the largest retail stores state that without question they have many more people coming to their stores by private automobile today than before the restriction. Checks made during May of this year to compare with previous counts, show a marked increase in the number of automobiles entering the Loop district; the increase being 14.1 per cent while the increase in automobile registration was 10.6 per cent. This is in spite of a general reduction in business activity. A cordon count shows a slight increase in the number of people coming into the central district as compared with the previous count. Practically all of the increase came from the private automobiles, as the number of public

COMPARISON OF COUNT OF VEHICLES ENTERING AND LEAVING THE CENTRAL BUSINESS DISTRICT OF CHICAGO TYPICAL WEEKDAY, MAY, 1926, AND MAY, 1928, 7 A.M. TO 7 P.M.

	Passenger Autos		Trucks		Horse-Drawn		Total		
	Inbound	Outbound	Inbound	Outbound	Inbound	Outbound	Inbound	Outbound	Grand Total
May, 1926	92,425	88,421	24,399	24,710	5,825	6,040	122,649	119,171	241,820

transportation vehicles remained about the same as before.

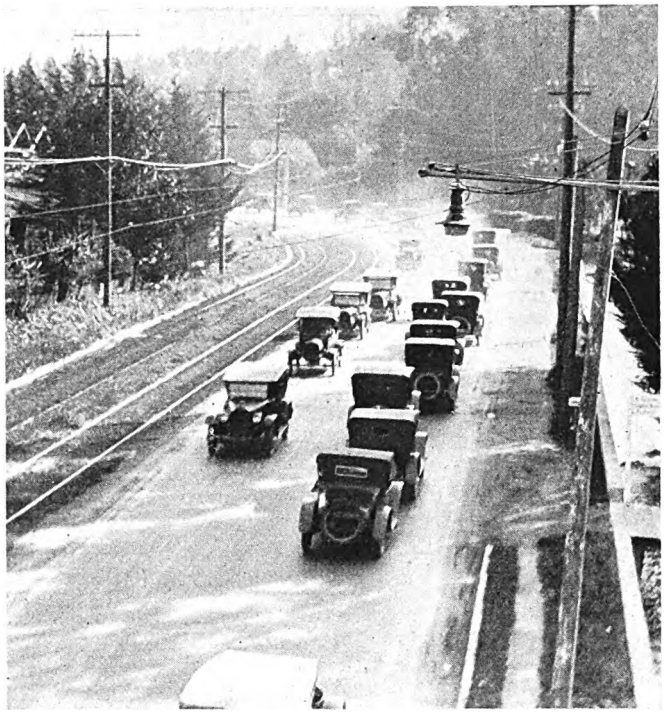
The Surface Lines has noted decidedly advantageous results from the changed street conditions in the Loop district after the no-parking regulation. The change resulted in a decrease of running time necessary within the Loop that amounted to from 15 per cent to 25 per cent for the various lines. Formerly, there were often delays resulting from second lane parking or from maneuvering to get into or out of parking space. These being eliminated the cars now make much more uniform speed. This produces a marked improvement in the regularity of the car spacing throughout the entire length of all lines leading from the Loop and so benefits all users of these lines even though they do not come into the central district. The reduction in running time can be expressed also as having been sufficient to release for improvement service about fifteen cars. This is the number formerly wasted by the delay beyond what now exists.

Colma "Bottleneck" in San Francisco Is Widened

Tracks of Market Street Railway occupy a 28-ft. strip in center of roadway, which now is 124 ft. in width

WIDENING Mission Road near Colma, south of San Francisco, for a distance of 1.6 miles and locating the double track of the Market Street Railway on a private right-of-way in the center of the highway, has relieved the congestion at this important point. The roadway before it was widened was only 24 ft. in width and consequently formed a regular "bottleneck." The highway is one of the busiest in the state, 19,000 cars being counted during a certain sixteen-hour period, so that the widening is of great importance.

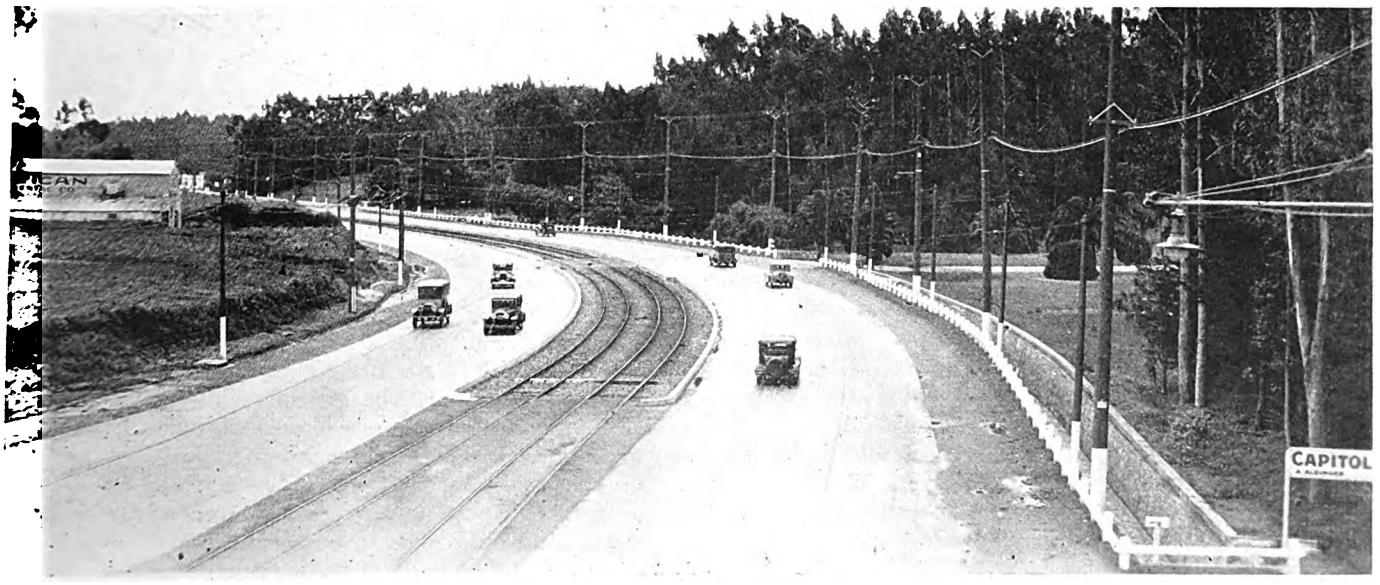
The completed artery has two concrete paved roadways 40 ft. in width for vehicular travel, a 28-ft. private right-of-way between the two paved sections for the double track of the electric railway, and strips approximately 10 ft. wide on the outside of the pavement. The railway's right-of-way is inclosed by a curb 1 ft. high, and at crossings where there is danger of automobiles driving into the open track construction red reflectors are mounted.



View of the "bottleneck" before the widening. Much congestion resulted at this point because of the narrow roadway

Approximately $600,000 was spent in widening the highway, the share being borne by the railway in centering its tracks being $55,000.

Red reflectors placed between the tracks give a warning to motorists where track and highway separate



View of the same section of Mission Road after it had been widened and the Market Street Railway tracks centered

Increasing Rail and Tire Life

It should be possible to get greater wear by suiting the rail and the wheel surfaces to each other

By James Silberstein
Metallurgical Engineer, Chicago, Ill.

SINCE railways began to grow and develop the rail problem and, perhaps in a slightly lesser degree the tire problem, have always been with us. Today they are of greater importance than ever, not only because heavier loads and higher speeds impose more strenuous conditions on both wheels and rails, but also economic conditions make the profitable working of the railways an increasingly difficult problem. The life of rails and tires in relation to their cost is an important factor in railway economics, and is thus of interest not only to those concerned with the railways themselves, but to all those affected by the satisfactory and economical working of the railways.

It is obvious that the use of heavier axle loads and of higher speeds demands the use of harder materials, if only from the viewpoint of actual surface indentation. That actual indentation under wheel loads must be amply avoided is clearly necessary, since otherwise rapid destruction of the surface layers must follow. Actually, while perceptible permanent indentation under the wheel loads probably never occurs in normal service there are occasions when special conditions lead to very severe local loading of both rail and tire, as, for instance, by the sudden application of brakes, leading to skidding of the wheels. The effects of such loading, especially in connection with the formation of transverse fissures, has been studied, and it has been found that such loading is far more destructive than ordinary wear.

The natural tendency toward the use of harder steels has been followed extensively in practice. Some twenty years ago a steel rail with a carbon content of 0.25 per cent was regarded as normal, and fears were expressed that the use of higher carbon steel, although furnishing a harder steel rail and one likely to be more durable, might prove dangerous on account of the much reduced ductility. The experience of recent years has failed to confirm entirely either the favorable or the unfavorable anticipations in regard to rails made of harder steel. They have not proved unduly brittle or dangerous on account of their lower ductility, but, on the other hand, their greater hardness has not resulted in a corresponding diminution of the rate of wear. This latter fact has led to extensive investigations on methods of testing the abrasion resistance of steel. Finality in method of testing for this purpose has not yet been attained, and different types of abrasion test still yield results which are not fully comparable. All agree in showing, however, that hardness as measured by indentation tests, and therefore tensile strength, is not a measure of wear-resisting quality. As yet it is not possible to state to what other physical properties of steel this power of resisting abrasion is related, and we have either to be content with empirical test data for comparison or have to resort to the slower method of testing various types of steel in service in order to arrive at a basis of selection.

Meanwhile, metallurgists have not been idle, and much has been done towards the improvement of the wear-resisting quality of rail steel by heat treatment. This has been developed according to several somewhat different methods, which all aim at giving the rail a hardened wearing surface without converting the entire section into hardened and relatively brittle material. However, it must be admitted that here also finality has not yet been reached. Progress is rendered difficult, from the metallurgical point of view, by the strict limitation of cost for a material which has to be employed in such large quantities as rail steel. The use of alloy steels is for that reason almost ruled out, unless they could be shown to have more than a proportionately longer life.

Even in simple carbon steels the question of cost as affecting quality is important. Sound steel, free from both pipes and blowholes and of good chemical composition, undeniably costs more than a blown steel of lower purity. If, however, special heat treatment is at all worth while, attention to the quality of the steel to be treated is fully as important. To heat-treat a poor quality rail is simply waste of time and money and leads only to the discrediting of the heat-treatment method. It is true that the soundest steel neither is proof against rapid wear under adverse conditions nor apparently exempt from transverse fissuring, but its resistance can be materially increased by heat treatment. The same treatment applied to unsound steel can never overcome the inherent defects of the material, and by the formation of cracks even may intensify them.

Tires Are a Less Difficult Problem

The tire problem, although intimately bound up with that of the rail, is not quite so difficult. The tonnage of steel concerned is not nearly so great and the question of cost of the steel not so prohibitive. Even in tires, however, alloy steels are not, as yet, very widely used, and reliance is placed on high-carbon steel. Here, however, attention is seriously given to the quality of the steel as regards soundness, chemical composition and segregation. The modern method of rolling tires from cheese-like sections of ingots or billets, instead of from the old beehive ingots, has eliminated some serious risks of unsuspected unsoundness. On the other hand, cracking still occurs sometimes as result of the stress produced when the tire is shrunk on to the wheel. The stress which is imposed upon the tire as the result of shrinking on, although it may lead to fracture, presumably does not affect the wear resistance of the tire. The latter may perhaps be regarded as reasonably satisfactory at the present time, but if the wear resistance of the rail is increased it must imply increased wear on the tires, unless the quality of these is proportionately improved.

At present the tire is much harder than the rail, and the rail is worn away. If the conditions of hardness are reversed, then it is the tire that would take the wear. Here the use of special heat-treated alloy steel may prove to be necessary, but again the question of abrasion testing arises. It is, indeed, only when we can readily determine the wear-resisting properties of our materials that we shall be in a position to discover, without the need of long and costly service trials, better materials for these special purposes. This is surely a matter of primary importance to the railways. The user of materials generally expects the manufacturer to carry out research and initiate progress. In the present instance, however, the gain from progress will be entirely with the user, the railway. Increased resistance to wear, provided without any great additional cost, will entail no increase of output for the steel-maker, while to the railways it will be a matter of great financial advantage and even of economic necessity. It would seem to be a case where at least a great part of the onus of providing for progress should fall directly upon the user.

Buses on eight city routes of the company circle the "loop" district of downtown Tulsa

Short Interurban Is Backbone of Extensive Bus System

By R. V. Miller
General Manager Oklahoma Union Railway, Tulsa, Okla.

Twelve city bus routes reaching all sections of Tulsa, Okla., and three intercity bus lines extending approximately 116 route-miles operated by Oklahoma Union Railway

CONDITIONS usually existing where combined bus and car services are found are somewhat reversed in Tulsa, Okla., where the Oklahoma Union Railway has built up a city-wide bus system in connection with its interurban railway. Only one city car line is operated by this company, over its interurban tracks within the city limits. Yet twelve city bus lines, extending 56.8 route-miles and handling 20,000 passengers per day, are operated by the Union Transportation Company, the bus operating subsidiary of the Oklahoma Union Railway. In addition to the city route, the company has three interurban bus lines with a total mileage of approximately 116 route-miles.

The railway interurban line is 24 miles long and joins Tulsa and Mounds, passing through Sapulpa. No passenger service is given between Mounds and Sapulpa, this portion of the railway being used for freight only. Between Sapulpa and Tulsa hourly passenger service is given and a great many passengers are carried. Sapulpa is the termini of several bus routes and many passengers transfer at this city to the interurban railway to continue to Tulsa. The railway enters Tulsa from the southwest,

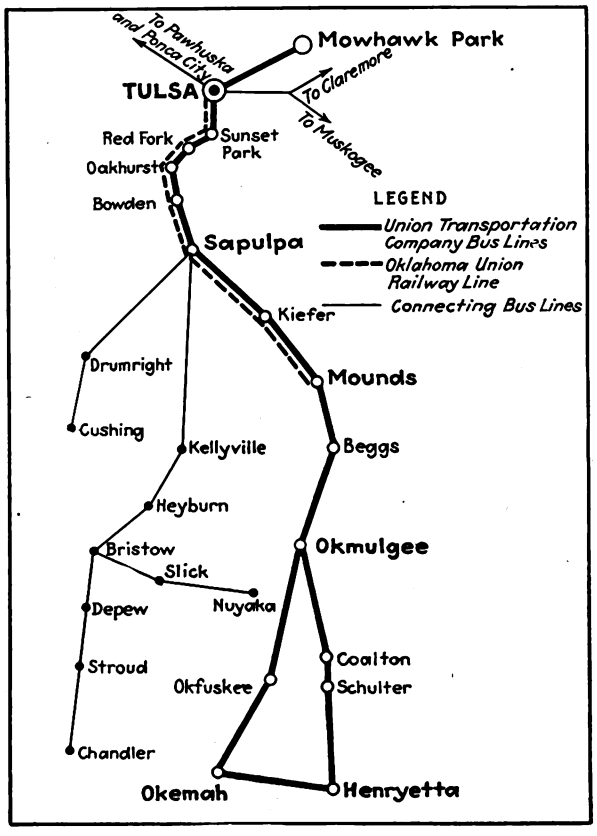
Bus routes of the Union Transportation Company reach all sections of Tulsa. The interurban line of the Oklahoma Union Railway, the parent company, also handles part of the city traffic

passes through the main business section and terminates at the Tulsa Live Stock and Industrial Exposition grounds in the southeast part of the city. The track leading to the Exposition grounds is used during fairs, when carload freight, as well as passengers, is handled.



Map showing the intercity bus lines of the Union Transportation Company and the interurban line of the Oklahoma Union Railway. Connecting bus routes, also shown, bring much business to the company

Buses Followed the Jitneys

Early motorized transportation service in Tulsa was by jitneys. Through organized association the individual jitney operation became a disorganized system, all of which was purchased by the railway. With the intention of forming a city-wide bus system, the company extended its lines to all sections of the city. The same procedure was followed in establishing intercity bus service. The extensions were made to the interurban and competition prevented along the main line. Through co-operation with independent intercity bus operators radiating out of Sapulpa, these lines terminate there and the traffic is transferred to the electric cars for the run into Tulsa.

City street car service is given by another company in Tulsa. Transfers, however, are exchanged between cars and buses of the two systems. Transfers also are issued and accepted between cars and buses of the Oklahoma Union Railway. The fare on the buses and on the street cars of the Union Transportation Company is 10 cents cash, with three tokens for 25 cents.

City bus service is given from the business district to outlying sections, all main lines radiating from the so-called "loop," a rectangular route four blocks one way and two blocks the other way. All buses move in a clockwise direction in circling this loop. Four short lines are operated as branches to the eight main routes. Four of the main lines are consolidated for through route service from one side of the city to another, passing through the business district en route.

Service on the twelve routes varies from a frequency of five minutes to thirty minutes during the day. The frequency is increased during the peak hours. Detail operating data on the service given by the city system are given in Table I. The route numbers are keyed to the accompanying map of Tulsa.

Sections of the city unserved by car lines, as well as districts served by the local railway, are included in the scope of the system. The ability of the bus to enter restricted residential areas has enabled the company to develop a new business. New subdivisions are entered with the branch lines. One bus over a short route with frequent service is used to determine whether or not a main line is needed for that particular district.

Several Cities Reached By Interurban Buses

The main intercity bus line of the company extends from Tulsa to Okemah, passing through Sapulpa, Mounds, Okmulgee and Henryetta. It is 77.1 miles long and serves, in addition to the cities named, several smaller towns. Five buses are operated daily in each direction over the route, and in addition one bus per day in each direction is scheduled between Okmulgee and Okemah.

The other two intercity lines are much shorter. One of these, joining Okmulgee and Okemah by way of

Anticipating Economic Changes

By Charles W. Chase
President Gary Railways, Gary, Ind.

Many things can be done by the electric railway to anticipate losses in revenue and provide additional sources from which the gross business may be recruited

This article, based on a paper presented by the author at the summer meeting of the Central Electric Railway Association, shows that there is no need for pessimism regarding the industry so long as there are many ways of strengthening its financial position.—EDITOR.

NO BUSINESS or industry has an assured future, but we find that a courageous, intensive and intelligent effort on the part of those burdened with the responsibility has safely adjusted each industry to changed conditions and enabled it to go on to ever-increasing usefulness and efficiency. This experience of the past and a survey of the present should teach us that though our way may be long and arduous, yet by patience, determination, endurance and the application of every ounce of energy, vision and intelligence we may possess, we can readjust our industry to the shifting current of economic life and competitive business.

It is quite apparent that geographical location has little to do with the answering of this question as to the future of street and interurban electric railways. Given a certain minimum population per mile and communities of a normal character to be served, there would be no question as to the future of the industry in general if motor transportation did not have to be reckoned with. Increasing costs of labor and material involved in rendering transportation can be met, either by reasonable increases in our service charges or through increased mechanical and operating efficiency.

It is certain we do not wish to combat the continued construction of adequate and convenient streets and highways. Sooner or later motor coach competition must be placed upon a fair economic basis, and the users of the public highway as a place of business have to pay an increasing rental in taxes and charges. When paying for its privileges on the public highways, on a fair basis for what is furnished, motor competition will come to an end. On the other hand, enough has been accomplished by individual electric street and interurban railways in meeting this particular menace of motor transport competition to justify belief that the future of any particular property in our industry is going to be pretty much what the owners and management of that property make it, what they do or do not do to affect it, and what measure of ingenuity, courage, perseverance and ability they demonstrate in meeting the common enemy.

Taking stock of our situation, what encouragement do we find? Of one thing we can be assured: The electric railway still stands supreme in the matter of economical, safe and comfortable mass transportation. A cursory study of the traffic reports of our companies and a glance at our streets and highways and the reports of sales and production of motor vehicles furnishes a quick answer to the question: why does the electric railway traffic tend to stagnate or decrease except in the largest cities or in territories where some special circumstances intervene? The conclusion is forced that for an indefinite period we must in general look for little increase in revenues, and that our principal hope of betterment lies in devising ways and means whereby expenditures of operation may be reduced without impairment of necessary or justifiable service.

If we pause for a moment and view the trend of economic affairs since the upheaval of the World War, it is significant that our country's domination of the world's markets is still marked. The foresight and enterprise of our industries in lowering price levels and the mechanization of industry have made this possible. Man power has been supplanted by mechanical power and that labor released for service in other channels. Mechanization of plant has saved many a thriving business from decay or destruction.

GREATER MECHANIZATION OF RAILWAYS POSSIBLE

Everywhere we see the same fierce race to substitute mechanical for man power. This suggests the question as to whether we have been as vigilant and as enterprising in securing to our industry the rewards of all possible mechanization as we could. Much has been accomplished in a sporadic or partial way, but have we adopted this means as a cardinal factor in our equipment to meet the economic pressure now on our industry? What proportion of our properties have adopted the use of one-man cars to such an extent as to increase the car-miles operated 30.2 per cent and reduce the number of operators employed 34.4 per cent and the payroll 4.6 per cent? It will be said that dense traffic conditions will not permit such dependence on one-man operation, yet it has been accomplished during peak-load operation with a headway of as low as a car every 30 seconds, handled by single and double-truck one-man cars and trail trains indiscriminately intermingled. Pneumatically-operated doors with automatic rear exits treadles, electric switches, and block signals have turned the trick, and quick accelerating motors, built and geared for high speed, give more time on the schedules than the two-man car crew had before. A scrapping of old, obsolete two-man equipment for modern high-speed luxurious one-man 52-passenger cars has produced a saving of 26 per cent in the cost per car-mile of operation of the schedules.

Automatic substations with mercury arc rectifiers suggest other objectives, whether fully automatic paying a handsome return in the case of central and main sub-

Digitized by Google

stations, or semi-automatic requiring no attendants, and an investment expenditure of hardly more than $1,000 per station.

An unnecessary loss is frequently incurred in layover time on schedules. Great savings can be accomplished by cutting layovers at ends of runs to a minimum. One property has achieved an efficiency of 95.63 per cent in its schedules by eliminating all unnecessary layover time.

Go through your shops and barns, look into the splendid mechanical exhibits at our A.E.R.A. convention at Cleveland and discover how many hands and backs can be relieved by the various labor-saving devices offered and the abundant return you can get on the comparatively small investments required in paint-spraying machines, banding machines, cranes, track and line machines. Encourage your shop employees themselves to devise labor-saving devices and reward the enterprise and initiative of the employee who by his ingenuity effects permanent savings in your operation costs. All of these moves may tend to make the shops look lonesome but they will get the work done and enable us to hold on to some of the dollars we get our hands upon.

Let a skilled business organizer study your accounting and treasury structure, and suggest machines for doing various phases of your accounting work, which will eliminate waste and duplicate effort, man or women power, or stop its increase. One recent merger of the accounting departments of transportation utilities improved the work with a decrease of 20 per cent in employees and 16 per cent in combined payrolls and rentals. Supervisory forces and even officials should not be overlooked. These always tend to become overloaded with positions which, once created, cannot be abolished without drastic action.

In the ways and structures department large results can be obtained by improvements tending to cut down the frequency of recurrent maintenance expenditures. Welding of track enables us not only to reduce greatly wear and tear of equipment, but also to obviate with the aid of light-weight cars a large portion of the necessary number of ties. Thermit welding of track on light interurban and suburban lines with slip joints every 1,000 ft. for expansion has eliminated one-third of the ordinary number of ties on one railway in mind. Steel ties with solid concrete construction (base and pavement) has reduced maintenance labor and costs tremendously on another Middle Western line. Mechanical tampers, the use of long-lived special work and materials, steel wheels with mileage reaching up to 176,000, all offer possibilities of reducing human labor and making savings in maintenance far overreaching the original investment. Other phases of our expenditures offer great opportunities for improving our financial position. Equipment trust notes with comparatively low interest enable many an impoverished property to secure modern cars capable of saving their cost within a comparatively short time by the economy of their operation.

Credit a Prime Requisite

The first requisite for the procuring of the varied economies possible from the use of modern labor-saving appliances and equipment is credit. Without this, progress must be slow in meeting the tide of diminishing return. Credit of the electric railways, as of the steam railroads, depends largely on the balancing of our capital structure. Too many of us are staggering under the load of interest-bearing obligations out of all proportion to the value of our properties, the aftermath of the promotional era. Today, if we expect to survive the wearing struggle, we must put our financial as well as our physical house in order. Owners of securities of properties whose earnings do not justify the load had better face the facts, give up their strangle hold on the credit and opportunities for improvement of such properties and accept adjustment securities, which will balance the financial structure and permit the issue of new securities upon which interest can be earned with reasonable certainty and leave a large margin of safety in excess value of property represented by capital stock fairly divided between preferred and common. Without a restoration of credit we cannot win this struggle; to attempt to stagger along under a load of ill-assorted obligations and securities is suicide for the property and security owners. A resolute facing of the situation and trimming of ballast to meet the storm is only common sense. Failure to adopt such measures will merit the punishment which will surely follow.

Subsidizing of Service Probable

It is more than probable that in the coming years we shall see a certain amount of financial aid given to the electric street railways in the form of indirect subsidy. It should be possible to finance necessary extensions of street railways to outlying suburban territory, or whereever their extensions are desired, by the method of special assessments just as other public improvements are paid for. Legislation should be enacted permitting districts to construct and pay for street railway extensions by special assessments of the property benefited, with appropriate leases of the extension to the operating company. The tremendous increase in property values accompanying a permanent form of transportation is abundant justification for property owners and real estate developers desiring such legislation. Safeguarding our revenue from piratical forays of mushroom motor coach and truck lines must engage our most anxious consideration. Experience shows that motor coaches can succeed financially only by the comparatively cost-free use of highways built at the expense of property owners and the general public. Only on especially favored routes of traffic density can such operation economically survive. The experience, however, is gained at tremendous cost to the electric railway as well as the motor transport competitor. While the acquisition of competing motor coach lines by the electric railways has generally only piled one loss upon another, yet it seems better to establish a skeleton coach service, reducing the loss to a minimum, than to permit the leech-like competition upon our best routes. On the other hand, motor coach service co-ordinated with the electric railway, has been successfully effected in many instances, saving the electric line large investments in doubtful extensions and taking care at a minimum of capital and operating cost of the demands of sparsely-settled suburbs and territory for transportation service.

There will undoubtedly be a considerable development and increase of revenue for many interurbans from the transportation of freight whether through interchange with steam and electric carriers or as complete transportation lines with freight terminal facilities in outlying portions of the cities served, where pickup and delivery can be accomplished by the use of motor trucks operated by local truckers or the electric railway itself, or by truck and carrier containers such as are being experimented with at present.

That traffic now using automobiles and motor trans-

Digitized by Google

portation can be induced to return again to the electric railway has been abundantly and lately proved by the successfully rejuvenation of some of our electric railway lines in the Middle West. On one road there has been a complete rehabilitation of ways and structures together with a complete reorganization of physical, financial and operating structure which in two years has resulted in an increase in passenger revenue of more than 150 per cent and in freight revenue of more than 200 per cent. This transformation has been worked out alongside of parallel hard roads carrying an intensive motor coach and automobile traffic and also in the face of formidable steam railroad and motor truck competition. It has demonstrated that speed, comfort and frequent service with an aggressive campaign for traffic can induce people to put aside their automobiles, forego motor coaches and steam railroads and travel the electric way.

The Future Is What We Make It

We have a concrete illustration of two electric street railways in adjoining cities of the Middle West of about equal size. In ten years on one line no single change has been made in method of operation with the result that today its public relations are ruined, its employee morale shattered, and its lines paralleled with a competing motor coach service far more extensive than the electric railway service. Its earnings have for years been decreasing and its property going into physical and financial decay with a general loss of credit. The other railway has extended its rail lines to meet justifiable traffic needs, protecting its property by supplementing and co-ordinating its rail service with motor coaches, and has either controlled or driven off motor coach competition by supplying the service itself. This railway, during the same period, has completely rehabilitated its property, operates speedy, light-weight, one-man cars with comfortable upholstered seats, on both city and interurban lines, has installed mercury arc rectifier and automatic substations, has completely reorganized and balanced its financial structure, pays about the highest rate of wages in the country, and as a result of all this since 1924 has increased its gross earnings 23.3 per cent, its net operating revenue 30.6 per cent and has paid dividends of 7.2 per cent on its preferred stock for the past three years. Its employees are all stockholders, as are hundreds of its patrons, and the property stands in the front rank of all movements for the welfare of the communities it serves. These opposite results have been accomplished under identical conditions and with similar opportunities. They are illustrative of the thought that the future of our industry is what the individual property makes it.

Other present-day experiences suggest means of bettering our condition. Merchants, when trade languishes, do not hesitate to adopt drastic remedies to attract business; low prices bring the shoppers to the counters in the poorest times. Why not try some of this in our industry? May not business and living conditions in this country have reached that point where it may be better for us to attempt to meet such conditions and fill our empty seats by establishing attractive prices for our wares than by further choking off traffic by continued increase of rates? Illustrations of the wisdom of this are not wanting. In two Texas cities of more than 150,000 people each, the weekly identification pass card at 40 cents with a 5-cent fare on each ride, with three tickets for a quarter, has produced an increase of 15 per cent in revenue. This same plan has been successfully used in several other cities and seems to satisfy all classes of traffic. Other properties have adopted the Sunday pass, good over all their lines, at the absurdly low rate of 25 cents, for which riding up to $2.65 worth is permitted, with the result that a net additional revenue of $10,000 per annum is already being earned, and Sunday riding restored to its former popularity. Another electric railway in the Middle West, by a reduction of 50 per cent in rates on one motor coach route 22 miles in length has trebled its traffic, reduced its expense per mile and made the route profitable.

There may be many properties, and we observe some from day to day, whose operating situation, traffic possibilities, competitive conditions and the limited population served may not warrant the continuance of the struggle with motor competition and whose wisest course may be to discontinue rail operation and avail themselves of the public's offer of cost-free highways to substitute motor service for their rail service, increasing at the same time the rates of fare and securing all available traffic between terminals. With limited traffic there is little use in trying to furnish the public with two classes of service between the same points. However, in territories of rapid growth or large population, it seems certain that if the electric railway service can be nursed through a period of years time will erect a protecting shield about it, traffic congestion and road taxes will strangle or retard motor competition and the electric railway again strike its normal rate of growth proportionate to that of the community served.

Electrification of Southern Railway in England

SPEAKING recently before the Institute of Transport, London, E. C. Cox, chief operating superintendent, Southern Railway of England, explained that the work of conversion of the single-phase system used on that line to third-rail direct current would be completed early next year. The company's single-phase system was installed about twenty years ago. Since then, some 49 route-miles of suburban line on what is now a part of the Southern Railway System was equipped with direct current and third rail. The desire to have a uniform system led to the conversion now taking place. When completed, the total route-miles of the Southern Railway electrified sections will be 255¾, embodying 875 track-miles. The total cost of electrification is set at £11,500,000.

Department Store Refunds Fares During Sale

CO-OPERATION between the Gary Railways, Gary, Ind., and a large department store of that city during a two-day sale of the store brought many customers. The store refunded the round-trip street car or bus fare of each customer who purchased $5 worth of goods or more, and the railway, for its part, provided additional service.

Conductors on five street car lines and on all the buses of the company gave slips to the riders as they boarded the vehicles. Refunds were secured by presenting these slips at the store with sales slips showing the required amount. No mail, telephone or C.O.D. orders were accepted and the sale was extensively advertised, so that a great many people availed themselves of the transportation facilities.

Maintenance Methods and Devices

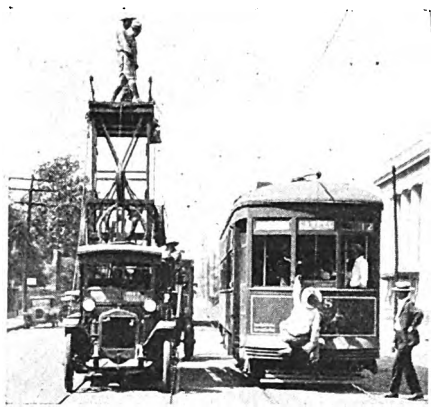
Economical Method for Renewing Trolley Wire*

By M. M. Watkins
General Foreman Railway Distribution New Orleans Public Service, Inc., New Orleans, La.

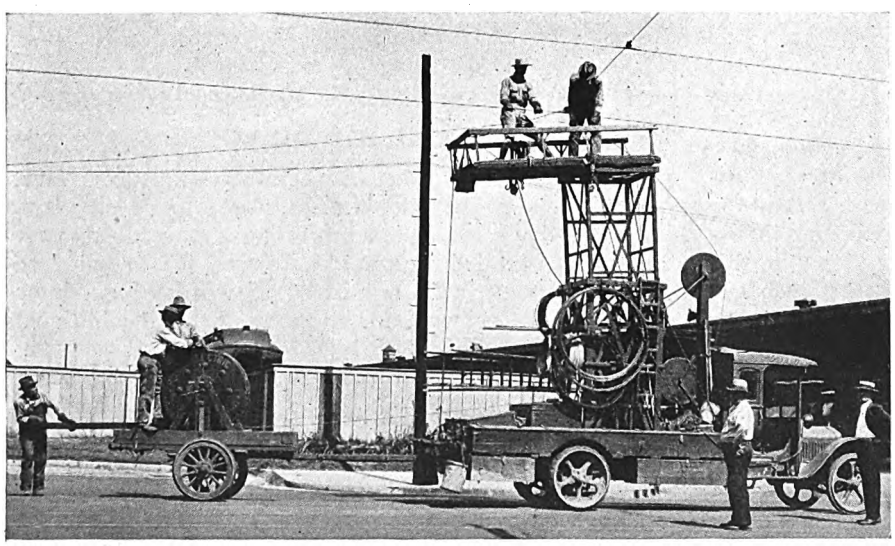
RENEWAL of trolley wire on the lines of the New Orleans Public Service, Inc., is done by a convenient and economical method. The regular tower trucks, which are in daily use on maintenance and construction work, have the tower set back to the rear of the truck a distance sufficient to allow the placing of an upright with two wooden pulley guide wheels between the cab and the tower.

When trolley wire is to be renewed a reel with a mile of trolley wire is placed on a two-wheeled gig which is hauled by the truck. The trolley wire is then threaded under the lower guide wheel, and up and over the upper guide wheel, back over to the tower and then is connected to the live trolley wire. As the truck moves along the street the trolley wire is tied up at each span in the regular manner. When a car approaches the truck simply pulls to the side of the track. After the car has passed, it again swings back to the track and work is resumed.

By this method a crew of seven men renew trolley wire at an average cost of $0.008 per foot. This is accomplished with cars operating over the line during the daytime without interrupting their schedules. This method has the additional advantage of eliminating a heavy and unnecessary investment in automotive equipment.



Service is not interrupted in the stringing of trolley wire as the truck pulls to one side to allow cars to pass



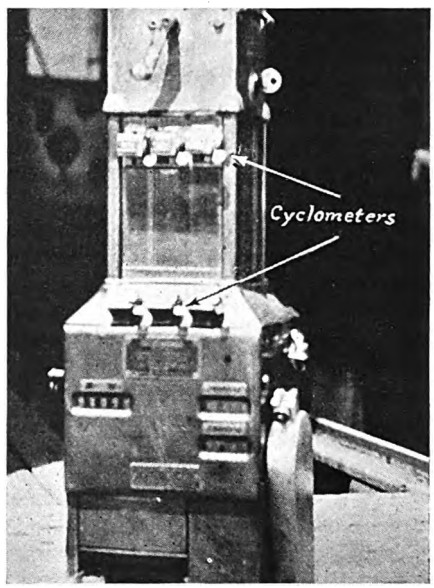
Method of renewing single trolley wire used by the New Orleans Public Service, Inc.

Cyclometers Used on Fare Boxes*

By Charles Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

MANY different forms of fares are collected on cars operated by the San Diego Electric Railway. These include, among others, a weekly pass, school pass, transfer and 5-cent fare. The counters are not used to check fares, as the fare box takes care of cash collected, but counters are used as a means of checking daily passengers so as to register the number of each class hauled. They replace the overhead registers, which were unsightly because of the cords and hangers dangling in the car.

Cyclometers are easily attached to the fare boxes and are considered quite essential for one-man cars where silent registration is desired, and where several types of fares must be collected. The cyclometers are fastened to the fare boxes by drilling holes through the housing and fastening them by means of No. 6 round head machine screws ⅜ in. long. The nut and washer are on the inside of the fare box.



Fare box with six cyclometers installed on it for checking passengers

In the accompanying illustration the fare box is shown equipped with six cyclometers. The three at the top of the glass inspection chamber are fastened by cutting out the glass to the necessary width for mounting. A piece of sheet metal is inserted in its place and the cyclometers are fastened to it. A metal plate wide enough to allow ½ in. over the cyclometer is used on which is stencilled, with ⅛ in. letters, the purpose for which each counter is to be used. Words are abbreviated, as weekly pass, W. Pass; School Pass, S. Pass, etc. The plate for the three lower cyclometers is made of No. 22 gage brass, inserted

**Submitted in* Electric Railway Journal *Prize Contest.*

Digitized by Google

inside the inspection chamber between the glass and the corner post.

Each counter has a small key, on the right-hand side, similar to a typewriter key. The counter has a stop so that only one number registers at a time when the key is struck. Counters are very compact and reliable, and little trouble has been experienced with them.

When the operator takes out a car in the morning he records the reading of all counters as well as the fare boxes. When he is relieved he takes another reading and so does the relief man. This is repeated every time crews are changed.

Combination Air Compressor and Street Crane*

By F. J. Martin
Superintendent of Maintenance
Pittsburgh Railways, Pittsburgh, Pa.

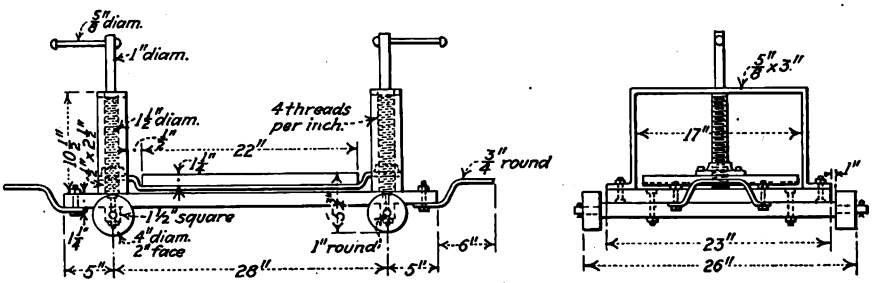
By THE combination of several standard units, purchased from manufacturers, the Pittsburgh Railways has assembled a machine to reduce track maintenance labor. This has resulted in faster and more economical work and quicker transportation of equipment to the various jobs. Track gangs are able to move to various locations, start and complete two or more minor repair jobs in a nine-hour day with less men than were used formerly. The use of this equipment has also resulted in another element of safety, in that it removes the hazardous work for track men by being equipped to lift from or into the track area all rail and special work, regardless of type, which formerly was done by hand labor in small jobs or required the use of a road crane in jobs of larger magnitude.

The machine consists of a runabout type of air compressor mounted on rubber-tired wheels. It is capable of traveling 20 m.p.h. The compressor has a capacity of 110 cu.ft. Two of the latest type of concrete breakers can be run satisfactorily. They are used for removing concrete from around the rail when it is replaced. The equipment has a 7-ft. crane with a pneumatic hoist, instead of other mechanical lifting devices. The crane is able to lift 2½ tons.

Submitted in Electric Railway Journal Prize Contest.

Truck for Handling Air Compressors

REMOVING or installing air compressors on cars without proper accommodations was always slow and tedious in the 96th Street shop of the New York & Harlem Railroad, New York, N. Y., until a special truck was designed. Often all of the pit space was occupied and compressors had to be removed and reinstalled quickly to avoid holding a car out of service for any great time. The truck designed for this work is shown in the sketch reproduced.

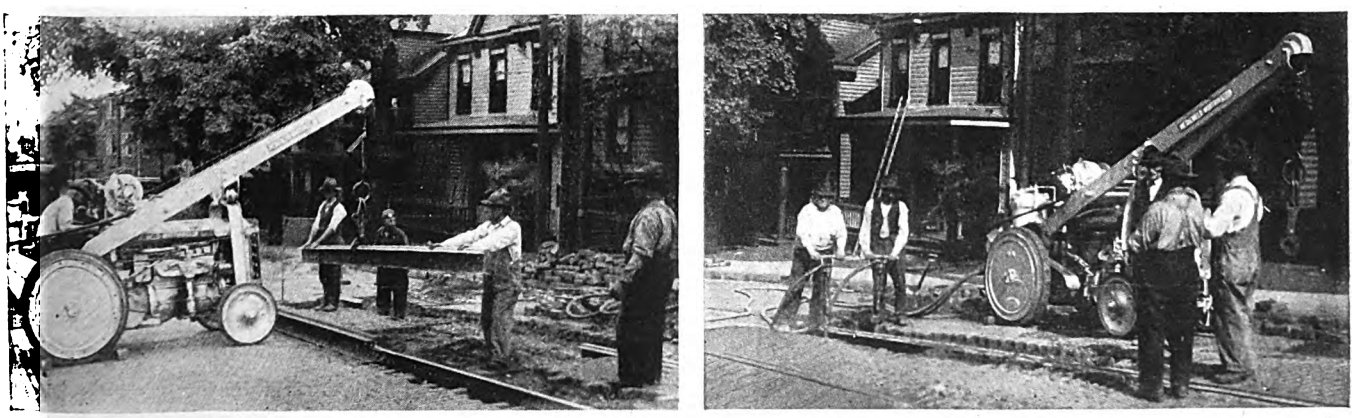


Handy truck for removing and installing compressors under cars

An oak platform 38 in. long by 23 in. wide of 1¼-in. lumber is bolted to two square axles spaced at 28 in. centers. These axles are mounted on solid iron wheels. Two U-brackets are bolted to either end of the platform over the axles. These brackets are 10½ in. long by 17 in. wide, and are made of ⅝x3-in. stock. The top of each is drilled for the centering and guiding of the top of an adjusting screw. The bottom of the adjusting screw is fitted into a threaded casting riveted to a ½-in. plate extending across the entire width of the bracket. A similar plate bolted to the platform acts as a lower guide and bearing for the adjusting screw. A movable oak platform 28x16 in. in size is mounted on two ½x3-in. bars, the ends of which rest upon the cross plates fastened to the end of the adjusting screws. Turning the adjusting screws to the right or left raises or lowers this platform. There is a guiding handle on either end of the stationary platform. It will be noticed that the movable platform is only 5¾ in. above the floor level, so that the truck can be placed under a compressor cradle when the car is not over a pit. When the truck is in position the platform is raised by operating the adjusting screws until the cradle is lifted enough to allow for the removal of its supports. Then the platform is lowered.

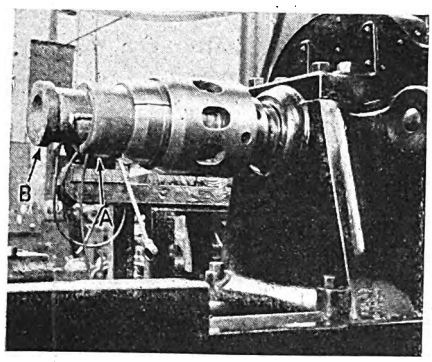
A Chuck for Different Sized Bearings

BORING of bearings has been simplified greatly in the Tompkinsville shop of the Richmond Railways, Inc., Staten Island, N. Y., through the use of a special lathe chuck. Previously a separate chuck was used for each size of bearing. It was



At left—Crane lifting rail into position. At Right—Air compressors supplying air for the operation of two concrete breakers

Digitized by Google



Bearing and adapters partially entered in chuck

found that these chucks had served their usefulness. After careful consideration it was determined that it would be more economical to scrap the old chucks and procure one chuck suitable for all sizes of bearings. A chuck designed to take the largest bearing which would have to be rebored was procured. Sets of cast-iron adapters were made up of the proper thickness to be used between the chuck and the smaller diameter bearings. These adapters were made up in pairs and numbered to correspond to the particular type of bearing with which they should be used. The accompanying illustration shows the chuck in position on a lathe, together with a pair of adapters, *A*, and a small diameter bearing, *B*, partially entered in the chuck.

This arrangement has simplified the boring process, increased production and eliminated the necessity of having more than one chuck for the boring of all bearings.

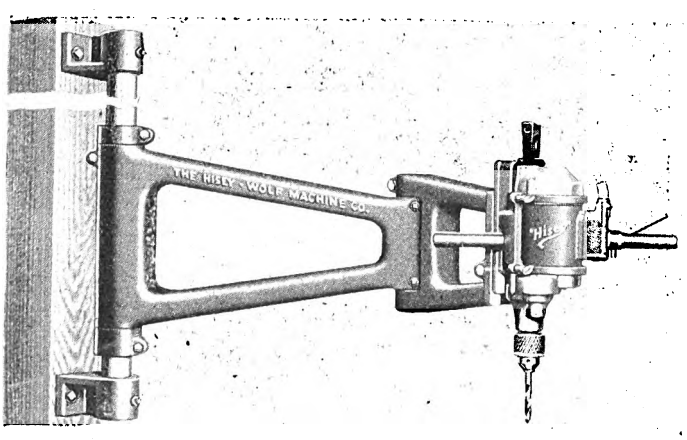
New Equipment Available

Radial Arm for Portable Drill

MEANS of supporting portable electric drills by a radial arm mounted on ball thrust bearings is announced by the Hisey Wolf Machine Company, Cincinnati, Ohio. This mounting will support all Hisey drills up to and including the $\frac{7}{8}$-in. capacity.

The lever feed is through a rack and pinion the same as a drill press, thereby permitting a positive and sensitive control without fatigue to the operator. The motor holding brackets are designed so that the portable drill can be attached without removing any parts of the machine.

It is stated that this feature is a great time saver and a protection against loss of parts. By means of the individual swivel clamps either the long or short arms can be locked independently, whereas, if the work requires, both arms can be locked in any fixed angular position.

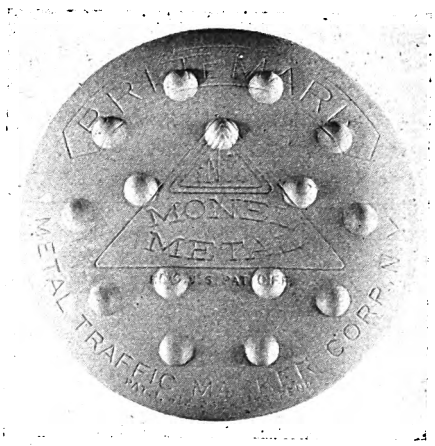


Double radial arm for mounting portable electric drills

Monel Metal Traffic Marker

FOR the marking of safety zones, of turns to show clearance lines for car swing end over traffic lanes, station platform guard lines, storeroom floor subdivisions, shop traffic lanes and every other floor or road marking requirement of the electric railway, the Britemark Monel metal traffic markers have been developed by the Metal Traffic Marker Corporation, New York, N. Y.

They are made with a soft heat-treated malleable iron base, which includes a stem with prongs which on installation spread out, giving a permanent anchorage. This base is sheathed in a top made of heavy gage Monel metal, rolled over the edge of the iron base so that it will not become detached. It is stated that the markers may be installed easily and cheaply in asphalt, concrete, brick, granite block, wood, creosote block or any other kind of pavement at any time of the year, either while the pavement is being laid or after.



Top view of one of the metal markers

They are slightly dome-shaped, which enables them to reflect light in all directions and to be visible easily. When installed the crown projects approximately $\frac{1}{2}$ in. above the paving so that it will not interfere with traffic.

The Britemark marker is made in $1\frac{1}{2}$ in., $2\frac{1}{2}$ in. and $3\frac{1}{2}$ in. diameters.

Improved Portable Electric Blower

FOR WORK where compressed air is not readily available, but where electrical connections can be made, an improved construction for the Ideal portable electric combination blower and suction device is announced by the Ideal Commutator Dresser Company, Sycamore, Ill. The motor is a unit with this equipment and the opening and closing of the circuit is done at the handle grip. Recent improvements in the combination have made possible the addition of suction attachments.

Association Activities

Progress the Theme of Southern Maintenance Men

Electric Railway Association of Equipment Men, Southern Properties, has enthusiastic meeting at Cincinnati. Need for improvement in maintenance thinking brought out

NINE papers, whose subjects included the whole field of railway and bus equipment maintenance, made up a full program for the first day of the meeting of the Electric Railway Association of Equipment Men, Southern Properties, held in Cincinnati, July 25-27. This was the fourteenth semi-annual gathering of the association, which in the seven years of its existence has grown from four to nearly thirty properties. It was also the first meeting to be held in the Central states. Some 200 attended the sessions, including representatives from Baltimore, Kansas City, Pittsburgh and other properties beyond the original boundaries of the association. By vote of the executive committee, announced Wednesday, the association's membership, with the exception of those properties from other sections already affiliated, must be confined hereafter to the original territorial limits.

President Robert M. O'Brien, who presided at the meetings, in his address opening the program Wednesday morning, emphasized the need for applying engineering methods to the solution of modern transportation conditions. He prefaced Wednesday afternoon's program by calling on C. L. Van Auken, managing editor *Electric Traction;* Leonard Church, assistant editor ELECTRIC RAILWAY JOURNAL, Chicago, and F. J. Foote, president Central Electric Railway Master Mechanics Association, all of whom took the opportunity to express themselves on the work of the Southern Association.

MASTER MECHANICS SHOULD PROGRESS

While electric railways have improved their public relation functions greatly, have created and are developing the new art of merchandising transportation, and have reduced the operation of their services to almost an exact science, they have not, according to Myles B. Lambert, transportation sales manager Westinghouse Electric & Manufacturing Company, fully recognized and appreciated the importance of the master mechanic. Perhaps the reason why more rapid progress has not been made in evolving the kind of street car that the railway industry needs to place it on a more profitable and satisfactory basis, said Mr. Lambert, is because the master mechanic has not stepped along with the times, and has not occupied the place in the councils of the industry that he justly deserves. There are those who believe that many of the recent troubles of the street railways would have been avoided had the managements of fifteen years ago recognized that the master mechanic held the most important and responsible position of any department head in the system. If he had received this recognition; if his job had been made more attractive; if he had been properly supported and assisted; if, in a word, he had been a real power in the industry, the speaker held that he would have responded more readily to the change in transportation demands brought about by the automobile and would not have allowed the development of the street car to stand still while business rolled by it on rubber tires.

Fortunately, comments Mr. Lambert, the master mechanic's job is rapidly evolving into its rightful proportions. Fully developed talent is, of course, scarce because of past practices, and another ten years may be needed to train a sufficient number of skilled engineering and executive master mechanics or superintendents of equipment adequately to serve the industry. Only by continuing to develop a broader concept of their job and by the exercise of aggressiveness may they secure for themselves the necessary facilities for handling the work, or persuade their managements to do what is essential to enable them to function efficiently. However, the master mechanic must acquire a wider vision of his vocation. If he is really the "master" of mechanical car service for his community's railway system he must realize that the great majority of all people in that community are looking to him personally for their major transportation service, and that the entire business and social structure of the community are vitally affected by the type of cars and service he provides.

Mr. Lambert urged the association to embrace a definite program toward evolving the kind of street car the industry needs. As a first step in this direction he suggested the appointment of a committee of the association to review all cars exhibited at the coming convention in Cleveland and report on the best all-around designs, or combination of designs, displayed. Another step suggested was to have a committee prepare a word picture of what would constitute the ideal modern car, covering such items as acceleration rates, braking rates, seating arrangements, weight of car, wheel size, axle size, etc., keeping in mind that the differences in opinion on car design on the part of master mechanics has presented one of the most difficult and expensive problems that car builders and equipment manufacturers have had to contend with. Do not forget, said Mr. Lambert, that we shall not cure our present traffic ills entirely through regulation, restrictive parking laws, street widening, rerouting, etc., but by providing a mass transportation superior to any other form of transportation. Special attention was called by him to the address by E. J. McIlraith, staff engineer Chicago Surface Lines, before the Canadian Electric Railway Association and published in ELECTRIC RAILWAY JOURNAL for June 23.

EMERGENCY SERVICE CENTRALIZED IN CINCINNATI

The Cincinnati Street Railway, in an effort to improve the regularity and dependability of operation, has centralized the control of emergency service in a dispatcher's office manned by three dispatchers, each on an eight-hour shift, covering the full 24 hours, according to Joseph Ong, transportation engineer. The service on the street is in charge of a uniformed force of supervisors who are stationed at specific points where they can watch the movements of the cars on several lines. Each has a looseleaf book which is distinctive because: (1) It shows the exact time of all cars due at the point for which the book is prepared, permitting quick check-up of "on-time" operation; (2) it shows the relative position of all cars using common track, permitting a quick check-up on the movements of cars with reference to each other; (3) the form is condensed so that one double page covers an hourly period; (4) in looseleaf form page replacements can be made readily; (5) corrections for schedule changes on any line are easily made without disturbing the record of cars on other lines. Mr. Ong described in some detail the new arrangement of the company's telephone system, which centers in a private branch exchange with trunk lines to the Bell Telephone system.

There are nine operating divisions on the Cincinnati street railway system with a carhouse located in each division. At five of these, motor trucks are kept for emergency service. At a sixth location just outside the congested downtown area is located an additional emergency truck. In handling this emergency service with automobile

Digitized by Google

trucks instead of wrecking cars Mr. Ong said it was found the trucks could more quickly reach the scene of the trouble, resulting in much time saving. In addition to the emergency service trucks three regular line trouble trucks are located advantageously about the city. All line trouble trucks are manned by linemen, and only those located at headquarters can be used for other work between calls. This elaborate system of trouble and emergency service is under the control of the dispatcher's office, which serves as a clearing house for information for all of the officials of the company, as well as centers authority for action in emergencies.

In discussing the place of the bus in urban transportation V. W. Berry, assistant general manager Virginia Electric & Power Company, traced the development of this type of transportation from its advent on the west coast in the latter part of 1914. While the bus has a place it has its limitations and will not supplant the electric railway as a principal transportation agency in urban communities. On the other hand, if the electric railways are to continue successfully as the principal transportation agency they must recognize the field for buses and supply that service. Otherwise, it will be furnished by independent operators, much to the disadvantage of and at a serious loss to the electric railway. The principal condition affecting the success of urban transportation systems today is, according to Mr. Berry, the competition offered by the extensive use of the private automobile. The use of buses in urban centers during the past few years has proved that they are generally subjected to the same competition as the street car. With the ever-extending use of the private automobile, public transportation has become a highly competitive business, requiring the same degree of skill in salesmanship as any other business having competition to meet.

Meeting Competition

In his paper, "What Are You Doing to Meet Competition?" E. P. Waller, manager railway department General Electric Company, likened the electric railway, steam railway and bus operating companies to manufacturing companies producing transportation as a product and selling it to the public at a fixed price. Figures from a survey made by Electric Railway Journal some two years ago of the age of street cars in service in the United States were cited to show that upward of 40,000 street cars in daily service are now obsolete; are, in fact, so inefficient and so expensive to maintain that it is little short of a crime to run them. Modern equipment will, according to Mr. Waller, do more than affect the operating cost, for quieter cars, better looking cars, more comfortable cars and faster schedules appeal to the public and unquestionably bring more riders. Assuming that the substitution of new cars will bring in only 5 per cent increase in gross, this will, in many cases, result in a net profit instead of a loss. Modern equipment permits the fastest schedules with new light-weight cars even when run with one man, and the later designs readily lend themselves to the use of one man instead of two in all classes of service, city, suburban and interurban. To the direct economies of one-man cars, there should be added the savings due to running a small number of cars for any given headway, and the increased riding that usually follows improved schedules.

Oct. 8-12—**American Welding Society, fall meeting, Philadelphia, Pa.**

Nov. 14-15—**Public Utilities Association of Virginia, Roanoke, Va.**

Carbon Brush Development

While the carbon brush may be given credit for the success of electric railway service, a large share of credit for progress in the development of carbon brushes must in turn be given to the experience gained in electric traction, declared W. C. Kalb, National Carbon Company, Inc. In the order of their relative importance, the requirements placed upon a brush for railway service are: (1) maintenance of commutator surface at minimum cost; (2) keeping within normal temperature limits; (3) brush life. While commutator maintenance per car-mile is small today, still it is an item of major importance and is influenced to a large extent by the characteristics of the carbon brushes. Abrasiveness must be avoided but the brush must be sufficiently hard to polish the commutator surface and sufficiently strong to withstand the mechanical stresses. Low friction is important, not only to maintain temperature within the desired limits, but also to prevent chattering of the brushes with resultant breakage. Long brush life is a result rather than a characteristic. Good commutation and freedom from chattering are important factors in obtaining long brush life, while hardness and mechanical strength have a secondary influence.

Side wear in certain types of motors becomes a limiting factor in brush life. This problem is so serious on some installations that it has lead to a great deal of investigation. Side wear results from three distinct causes: vibration of the brush, abrasion from dirt drawn into the motor, or burning due to arcing between the brush and the side of the brush-holder box. While the present trend in railway motor design is toward small-diameter motors of high angular velocity with compound or worm gearing, Mr. Kalb concluded that no need has yet appeared for a radical change in the types of brush.

Comfort Is Required To-Day

R. L. Wommack, superintendent railway department Southern Public Utilities Company, Charlotte, N. C., in discussing modernizing street railway equipment, recalled the earlier days of mass transportation when a ride on any kind of an electric car was considered almost an excursion and was sought and enjoyed by the entire family. The advent of the automobile with its easy riding springs, its deep cushions and luxuriously upholstered seats has had the very natural effect of making the public dissatisfied with the kind of accommodation formerly furnished by the street railway. Speaking from experience derived on his own property he said that it had been giving an alternate five-minute service on one line with a small safety car and a 40-passenger double-truck car. Patrons purposely allow the small car to pass and wait for the larger and more comfortable one. In the opinion of Mr. Wommack, money spent in rebuilding old equipment in an effort to modernize it is, with few exceptions, just that much money and time unwisely spent and a valuable opportunity sacrificed to create good will on the part of the patrons for the service.

A paper presented by A. T. Clark, superintendent rolling stock and shops, United Railways & Electric Company, Baltimore, Maryland, detailed the development of the articulated car on the Baltimore property. References were made to detailed drawings of the different types of cars studied prior to the development of a sample car in Baltimore. The use of 34 articulated cars in Baltimore has made it possible to save the wages of two men per unit, totaling approximately $3,000 per car per year. With high power and use of pay-pass fare collection, it has been possible to increase the schedule speed about 25 per cent. The motorman likes its quick front-end loading, enabling him to move with the traffic signals. The conductor favors the car because the passengers pay as they pass through the steel drum connecting the bodies. The passengers favor it because it gets under way quickly, is speedy and can be boarded

Digitized by Google

rapidly in inclement weather. With only four motors as compared to eight, one air compressor as against two, and with other duplication eliminated, the maintenance cost is reduced about 30 per cent below that of two standard cars. It is true, admitted Mr. Clark, that these cars represent older cars reconstructed. Every advantage and more, can be obtained from new cars built from new material. The 34 cars in Baltimore have run a grand total of more than 3,000,000 miles, so that the car is no longer considered experimental.

More Than Half the Railways Now Run Buses

Recent reports indicate that more than 50 per cent of the street railways in the country are now operating some bus service, according to L. McInerny, master mechanic San Antonio Public Service Company, in his paper on bus maintenance. The continued purchase of buses by the street railways insures that bus maintenance is, or soon will be, a problem for the majority of electric railway maintenance men.

Effective bus maintenance appears to Mr. McInerny to be based on these five requisites: capable mechanics, an accessible supply of standard repair parts, modern and ample shop facilities, a definite and predetermined inspection, lubrication and overhaul schedule, and finally, an effective supervision through accurate and graphic records. This paper will be abstracted in an early issue of the JOURNAL.

Interesting Shop Men in Their Work

In discussing the co-ordinating of shop equipment and man power, E. J. Jonas, superintendent of equipment Cincinnati Street Railway, believes all will agree that the average workman is willing not only to give an honest day's work, but also to feel that he is a part of the organization that is successfully executing the functions for which it is set up. With this thought in mind the Cincinnati Street Railway has endeavored to lay out a repair shop in which the men could work to best advantage and under conditions that are healthful and pleasant. The next step has been to co-ordinate the efforts of the workmen to reduce waste of material and loss of man-hours to a minimum.

"We believe," continued Mr. Jonas, "this can be accomplished only by interesting the men in their work and educating them in the particular tasks they have to perform. All carhouse and shop foremen are urged to look upon their work as resembling that of manufacturers' salesmen selling car equipment to the transportation department of a street railway. Foreman conferences are held once a month with an average attendance of 30. These meetings have been found so satisfactory that weekly conferences of smaller groups have been established." The procedure followed at one of these group conferences was outlined in the April 14 issue of the JOURNAL. Mr. Jonas outlined briefly the time study and cost record system established at the new Winton Shops of the company and discussed some of the improved car handling methods which have been inaugurated recently.

Pittsburgh Car Tests Described

Comparative tests recently made on street cars in Pittsburgh formed the basis for the paper by W. A. Keller, supervisor of methods Pittsburgh Railways. The thing which was as important as any in bringing about the tests was the desire to speed up the service. The tests included braking with varying loads, air pressures, and speeds; dynamic braking and combinations of air and dynamic braking for several types of trucks; acceleration tests with varying loads, notching rates, and grades; determination of balancing or free running speed; drift runs to determine the coasting and train resistance values of various equipments; special tests on oiled rail to investigate the efficacy of sanding rails; checks of schedule speed over actual routes for different types of cars, number of stops and loads; determination in service of motor temperatures, and service data under severe peak load conditions; and adjustment of experimental equipment on special cars.

The Thursday program provided ample opportunity for animated discussions, since it was devoted specifically to a consideration of questions submitted to the meeting. A banquet Thursday evening gave the social touch to the convention, while inspection of the new shops of the Cincinnati Street Railway, Cincinnati Car Company and works of Tool Steel Gear & Pinion Company occupied the major portion of Friday morning's closing session.

The Compilation of Car Schedules*

The various factors, such as time checking, speeds, running times, layovers, car loading and staggered hours are considered, with examples from European practice

By M. De Barquin
Staff Engineer Brussels Tramways, Brussels, Belgium

RUNNING cars on schedule necessitates a time standard. Some companies have electrically regulated clocks at their carhouses and at other important points. Other companies regulate their own clocks. In Brussels the practice is for an inspector, between 6 and 6:30 a.m. and between 3 and 3:30 p.m. each day, to set his watch in the city by a standard clock, which is regulated from the National Observatory. He then telephones the official time to all carhouses, substations, shops and route terminals so that the clocks there have the exact time. The inspectors, conductors and motormen take their time from these individual clocks.

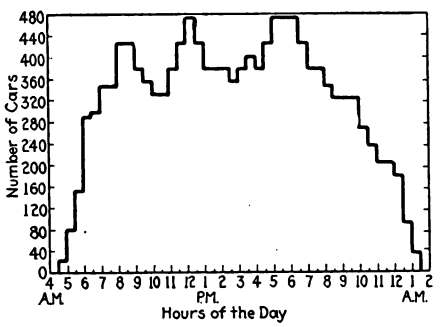

Chart of cars in service on a typical week day indicating the distinct noon peak, Brussels

Most companies base their car schedules on the same running time per trip throughout the day, though a few allow different running times for rush hours and slack hours, but with all, the running time per route differs with the conditions. In Paris the practice is to determine first the normal running speed for each line, independent of the extent of street traffic. This is done by running a car over the route in the middle of the night, when congestion is least. A plot is then made of the route to scale, with the location of all switches and crossings, curves and their radii, stopping points, etc. Each run is then divided into a number of sections, some short and others long, in which the schedule speed is affected by some permanent factor. To each of these sections the schedule maker then applies the normal maximum speed possible as determined by the trial run, but modified by the various factors shown on the chart for each section. The result is the minimum time necessary to make the trip, and the maximum speed possible in each section. This gives what is known as the "standard run." The time thus obtained is checked by a trial run in the presence of a transportation engineer of the company.

In Brussels three running times are used. The fastest is before 7:15 a. m. and after 8:30 p.m. The slowest is between 7:15 and 9:30 a. m. and between 11:30 a. m. and 7:30 p. m. The medium speed rate is between 9:30 and 11:30 a. m. and between 7:30 and 8:30 p. m. There is a distinct noon traffic peak in Brussels, as will be mentioned later. On Sundays and holidays, the fastest running time is continued up to 9:30 a. m. and the medium running time is used after 9:30 a. m., except on a few crowded streets where the slow running time goes into effect at 9:30 a. m.

Typical graphical time tables in Brussels, showing possibility of getting even headway on a trunk line served by several individual routes

In the Department of the Seine, in which Paris is located, the following are some of the controlling factors, with the maximum speeds used in these calculations:

Straight track at intersections, 12½ m.p.h.; between intersections, 18¾ m.p.h. (In the suburbs on reservations, speeds up to 28 m.p.h. are permitted.)

On curves with a radius of 82 ft. and less, 5 m.p.h.; with a radius from 98 ft. to 164 ft., 9⅜ m.ph.; with a greater radius, 10 m.p.h.

On ascending grades of more than 3 per cent, 10 m.p.h.; on less than 3 per cent, the same speed as on the level.

On descending grades from 2 to 3 per cent, 10 m.p.h.; from 3 to 4 per cent, 7½ m.p.h.; of 4 per cent and over, 5 m.p.h.

Slow downs: Passing over special work when not exceeding 12½ m.p.h., four seconds; exceeding 12½ m.p.h., nine seconds; passing over switches with movable tongues, five seconds; under bridges, five seconds.

Stops: Over special work, one second; at the city limits, inbound, for police inspection, 30 seconds; passing from overhead to underground conduit or vice versa, 30 seconds.

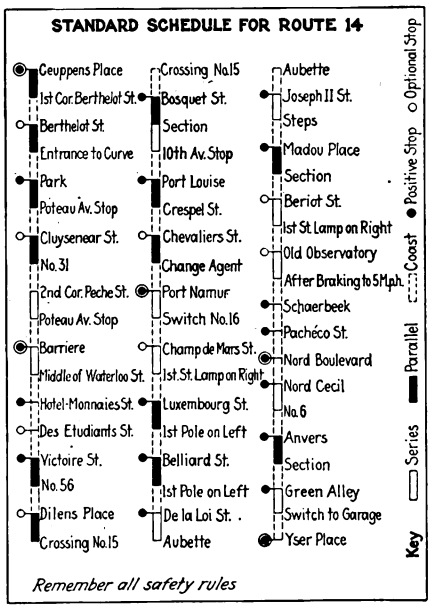
In a number of cities, maximum speeds permitted are covered by ordinances.

Keeping Cars on Time

Some companies issue time tables to their employees; others simply post them in the depots. The practice at Brussels is to give each platform man a time table of his run printed on a card which is varnished to keep it clean. Another card also given to each motorman shows the proper position of his controller between different time points. One of these cards is reproduced. The instructions for the run in one direction are printed on one side of the card, and for the other direction on the other side of the card. Other companies using control guide cards of this kind are Breslau, Budapest, Frankfurt and Amsterdam, and they are being tried in Paris and Copenhagen. The primary purpose of these cards is to reduce energy consumption.

The responsibility for keeping the car on time is placed by some properties on the motorman. By other properties it is placed on the conductor, and by some the responsibility is divided. Preferably, the responsibility for leaving on time should be on the conductor, and of maintaining the proper speed during the run on the motorman.

Apparatus for recording stops and the time taken between stops has recently been put on the market. It consists of a clock movement which draws a piece of paper divided into minutes under a marker, thus giving a graphical record of the movement of the car during each trip. While suitable for some conditions, it does not seem to be very applicable to large city systems where the necessities of the transportation department require the frequent shift of cars from one route to another. For such situations, definite time standards and time tables, with time checking, particularly at the ends of the lines, form the best system of follow up.



Guide for manipulation of controller on route 14, Brussels

The length of layovers varies greatly. Some companies, especially on belt lines, keep the equipment moving constantly but obtain layovers for the crews at intervals by providing an extra crew. This crew takes the car when it passes a certain point, and the disembarking crew takes a succeeding car after its layover.

While irregularity of headway is unavoidable in congested traffic, much can be done to reduce it by rigorous observance of leaving times from the termini and the employment of enough traffic supervisors along the line to check running time, to assist the crews in case of traffic delays, and to notify division headquarters of any delay that is unusual. It is quite common to vary the number of traffic inspectors on the street according to the number of cars in service. This is done in Brussels.

Automatic Time Clocks Used

Time clocks, at which the crew can get the time stamped when passing certain points, are used on a number of properties. When so employed they should not be at the terminal but a short distance from it, and the cards should be stamped both inbound and outbound. Otherwise they might be stamped at any time during the layover. Copenhagen and some other companies have automatic recording registers for cars arriving at the termini and for passing other points along the line. They are operated by an attachment on the trolley wire.

In a few instances bonuses are given to car crews for the maintainance of good schedules.

An essential aid to regularity of schedules is necessarily a well-equipped emergency force with necessary equipment for removing obstructions on the track, for repairing breaks, etc., and

Digitized by Google

a system of telephonic communication by which this emergency equipment can be notified of trouble.

PREPARATION of SCHEDULES

Schedules should be checked frequently by the records of passengers carried on the different routes. These records should show the number of passengers carried by half hours at points of maximum traffic demand and at certain other points along the route. With the zone system, the traffic demand in the various sections of the route can be determined approximately from a check of the receipts. With the flat fare, passengers have to be counted. The time distribution of traffic demand varies greatly with the city. A chart of cars operated on a typical week-day in Brussels is published. As will be seen, it has a distinct mid-day peak.

Regulations on car loading vary widely. Several cities permit higher car loading during rush hours than at other times, believing that it is in the interest of the public. Some cars are arranged so that space taken by seats in slack hours is turned into standing area during the rush hours.

Headways should be determined for different days of the week and different conditions, and should be flexible so that they can be changed promptly, if necessary. In many cities, the maximum time for headways on different routes is specified by the authorities. The ingenuity of the schedule maker is most severely taxed, perhaps, when he attempts to secure even headways on a trunk line used by a number of routes. Here, where a choice has to be made between regular headways on the individual routes and on the trunk line, the former should be given preference by the schedule maker. But much can be done by judicious planning, as shown by the combination of routes 1, 2, 3 and 4 between Bois and Place Stephanie in Brussels, of routes 6, 8, 11 and 12, between Ucele and Place Stephanie, and the combination of all of these routes and route 94½ between Eglise Ste. Marie, and Statue Belliard, as illustrated in the first, second and fourth graphical time tables, reproduced herewith.

STAGGERED HOURS

One question asked of the railway properties in the questionnaire was the extent to which it had been possible to obtain the adoption of staggered hours by large undertakings in their districts. Several reported success.

Antwerp got into action so far as it related to school hours and the hours followed in offices and shops. Nantes secured a spread of fifteen minutes in the discharge of employees from two large neighboring establishments. In Turin, where half of the 15,000 workmen in the Fiat Automobile Works use the street railways, the employees have been divided into three groups whose entrance to and exit from the factory have been spread over an hour, while the hours of the office workers are at still different times.

Building Public Confidence Adds Riders

OBTAINING increased patronage on street railway systems has occupied the attention of railway managements for many years, but since the advent of the motor vehicle the problem has become acute. Of all factors that affect riding, public relations is most important, and the application of good business methods to railway management the most effective in establishing good public relations. These opinions were voiced by J. P. Potter, vice-president Key System Transit Company, Oakland, Cal., at the last meeting of the California Electric Railway Association.

Undoubtedly public good will affects riding, perhaps to a greater extent than is realized, according to Mr. Potter. When buses and private cars offered practically no competition, little did many managers care whether the trainmen were ride salesmen! And to spend money for comfort for the passenger—unheard of! Worst of all, no effort was made to hide this feeling. And from that the idea was born that the trolley company cares only for itself and nothing at all for its customers.

Today much of the pioneering work in establishing satisfactory public relations has already been accomplished. But there is still much to be done. And if increased riding depends on the good will of the public, that much had best be done quickly.

If the conductor of a car is ill-mannered and abrupt with a rider, it does not necessarily follow that that customer must ride the trolley anyway. In that instance, perhaps he must. But tomorrow he takes his car and invites his neighbors to keep him company. Or he takes a bus, possibly with more comfort. All of which means competition. And in business, each must protect its trade by keeping in pace with the demands of its prospective customers. To quote Mr. Potter: "Good business men find it necessary to advertise freely and expend large sums of money to interest the public in their products, and above all to maintain confidence of patrons.

American Association News

Coffin Briefs Received

SIX contestants have presented their briefs in the contest for the 1928 Charles A. Coffin Award. They are as follows:

Shreveport Railways, Shreveport, La.

Northern Texas Traction Company, Fort Worth, Tex.

Virginia Electric & Power Company, Richmond, Va.

Gary Railways, Gary, Ind.

El Paso Electric Company, El Paso, Tex.

San Antonio Public Service Company, San Antonio, Tex.

Plans for Educational Luncheon Conference

SUCH was the interest shown at the educational luncheon conference held at Cleveland during the 1927 A.E.R.A. Convention, that it was decided to include a luncheon conference in its program for this year.

It is expected that the educational luncheon conference to be held on Sept. 25 this year will be one of unusual significance, according to members of the committee. A review of the many accomplishments and sales activities among transportation employees indicates that the years of work of the educational and other committees of the association have been fruitful. The association has felt that these various committees have been carrying on a research for the purpose of finding what instruction could be given transportation employees whereby their behavior on the cars would result in increased sales.

This year the committee on education has adopted a program which is worthy of advance study. For busy executives the educational luncheon conference held on Tuesday, Sept. 25, will afford an excellent opportunity to learn how transportation employees are receiving specific instruction for their jobs.

The open discussion will afford an opportunity for executives to state whether or not they are impressed with the policy that increased rides, other things being equal, is in some ratio to sales instruction.

"Lots of Fun" Planned for Metropolitan Outing

EXTENSIVE plans have been made for the entertainment of the members of the Metropolitan Section, American Electric Railway Association, at its fourth annual outing to be held at Luna Park, Coney Island, N. Y., on Aug. 16.

The day's program will begin at 9 a.m., with an 18-hole golf contest which must be terminated at 2 p.m. This will be followed by various games, including 100-yard dash for thin men, fat men's race, potato race, sack race, pie-eating contest, water-melon eating contest, quoits pitching, baseball, and bathing. At the dinner, which will be served at 5:30 p.m., prizes will be awarded to the various winners.

Wives and sweethearts of the members are invited by Barron G. Collier, as his personal guests, to partake in the evening's entertainment, which will begin at 7:45 p.m., with a parade forming at the gate of Luna Park. Everyone is expected to enjoy the circus as well.

Chicago Carries On

City goes ahead with plans for traction settlement and construction of high-speed rapid transit line

AS A result of the two recent decisions of the Illinois Supreme Court which held that under the act creating the Illinois Commerce Commission the city has no power to compel electric railways and bus lines to obtain local franchises for the use of its streets, negotiations for the settlement of the Chicago railway problem again are virtually at a standstill.

Asserting that the Supreme Court's decisions render the city helpless to deal with the companies, the local transportation committee of the City Council, in a statement issued on July 17, called upon the companies and railway bankers to agree to a home rule program and to take the stand that no railway ordinance shall become effective until home rule is restored to Chicago. Leonard A. Busby, president of the Chicago City Railway, who was present at the meeting of the sub-committee, replied that his company would willingly co-operate with the Aldermen on that basis.

The appropriation by the City Council of $649,928 from the city traction fund to finance subway building plans was held to be illegal in an opinion rendered on July 13 by City Comptroller Charles C. Fitzmorris. Mr. Fitzmorris announced that he would not honor the vouchers drawn on the fund by M. J. Faherty, president of the board of local improvements, until such an appropriation was sanctioned by the voters at a referendum. He declared that a specific provision of the annual budget prohibited the withdrawing of money from the $55,000,000 traction fund, without holding a popular referendum for that purpose, and that the Council, therefore, had acted without authority.

Mr. Faherty had asked the Council to appropriate the money for the purpose of defraying the salaries of real estate experts, draftsman and engineers and other expenses in the preparation of a downtown subway construction plan. The procedure he advocated was to draw all specifications for a tube on State Street, spread the assessments, and then go into court where the validity of building subways as a local improvement would be tested. While the comptroller's decision brought a temporary halt to the city's subway plans, Alderman J. B. McDonough, chairman of the local transportation committee, said that the committee would probably begin soon drafting an ordinance authorizing the expenditure for submission to the voters at the November election.

The active assistance of prominent architects and engineers of Chicago, composing the recently designated Citizens' Advisory Board, was pledged on July 23 to Mr. Faherty, in planning the general architectural layout for a comprehensive downtown subway system. A committee of three architects and four engineers was appointed to work out the general scheme for the tubes. It will review all subway plans and will select the one which seems best suited to the requirements of the local situation. Other committees will then be named to go into the details of the architectural and engineering features.

The advisory board was created at a meeting on July 19 between James Simpson, chairman of the Chicago Plan Commission, and Mr. Faherty, who had appealed to the Plan Commission for assistance as a result of the refusal of City Controller Charles S. Fitzmorris to recognize a $647,928 appropriation by the City Council to pay for the work of engineering surveys and plans. Following the completion of engineering plans, Mr. Faherty intends to make special assessments and take a test case into court so as to build the subways as a local improvement.

While the citizens' committee will not be asked to pass on the legal and financial arrangements, Mr. Faherty explained to its members that he proposes to pay for the first unit of the new subway by issuing special assessment paper and depositing it with the City comptroller. Money from the $55,000,000 traction fund would then be loaned to the board at 5 per cent interest on the basis of the security offered. When assessments are paid by property owners, the money would be credited to the traction fund, to keep it intact.

Baltimore Case Remanded

Court of Appeals holds commission was in error on several points in recent ruling. Rate-fixing commission function. Commission erred in taking orginal cost instead of reproduction figure

THE Baltimore car fare case is to be taken into the United States Supreme Court for final settlement. This decision was reached by the officials of the United Railways & Electric Company after the Maryland Court of appeals had handed down a decision partially reversing that of the Circuit Court of Baltimore.

When the United appealed for a 10-cent fare the Maryland Public Service Commission refused the plea, but granted an increase to 9 cents for cash fares or three tokens for 25 cents. The company took the case into the Circuit Court with the result that a decision was rendered against the Public Service Commission which opened the way for an increase on the part of the company. The commission then took the case to the Court of Appeals.

Commission's Depreciation Allowance Criticised

It was held by the Court of Appeals that the commission's method of fixing an annual depreciation reserve on "cost" instead of "value" was wrong and the case was remanded to the commission for further procedure. It is held that this ruling would result in a slight increase over the present fare. But the United has determined to take the case to the Supreme Court.

It was said by the company that the effect of the latest ruling is a rate of return so low that it amounts to confiscation and puts the company in a credit position where it cannot raise the necessary millions of dollars with which to maintain car service in Baltimore and provide for the future needs in financing and development.

The decision of the Court of Appeals of Maryland was written by Judge Offutt. Chief Judge Bond and Judge Parke dissented in part. The opinion goes into the case in great detail. The syllabus of the decision says:

Application was made by a street railway to the Public Service Commission for permission to increase its base fare to 10 cents, alleging an apprehended financial crisis and urging that it be allowed the increase immediately as an emergency measure. After testimony, the commission denied the application but permitted the company to collect a base rate fare of 8½ cents when fare checks are purchased, or 9 cents cash for each passenger more than twelve years of age. The company being dissatisfied, filed a bill asking that the order be nullified in so far as it prevented a charge of a flat 10-cent fare, and asked that the commission be enjoined from enforcing its order or any prior order limiting the company's rates. A decree was passed vacating the order in so far as the same purported to limit the rates to the company, and enjoining the commission from enforcing that or any other orders in so far as they limit or purport to limit the rates of fare to be charged by the company, and ruling was based upon the commission's "election" not to have the case remanded to them.

Held: That a court has no right to fix rates, as its function is judicial and confined to determining whether an order of the commission is valid or invalid, and if the order is unlawful or confiscatory then the case should be remanded to the commission for further proceedings in accordance with such guides, rules and standards as the court might by appropriate decree direct.

Digitized by Google

That under the statute, the power to fix rates is in the commission alone.

That a schedule of rates which permits the company to earn 6.26 per cent on the fair value of its property cannot be said to be confiscatory.

That the company is entitled to such an allowance as will not only adequately provide for current repairs, but for depreciation due to necessary retirements, obsolescence, and diminishing utility of property which cannot be arrested by repairs.

That the commission in fixing the fare schedule allowed 5 per cent on the gross revenue for depreciation, and it considered the cost and not the present value of the company's depreciable property, and in so doing it did not adopt the proper method, and the case should be remanded to the commission in order that it may determine the proper allowance for depreciation, and if necessary readjust the rate schedule to cover any changes it may make in that allowance.

In conclusion the court said:

For reasons already stated it follows that so much of the decree from which this appeal was taken as vacates that part of the order of the commission which fixes the schedule of fares to be charged by the company, and so much of said decree as enjoins the enforcement of that part of said order was erroneous, but because that schedule was in part based upon an allowance for annual depreciation arrived at by unlawful and unreasonable methods and by the use of an unlawful and unreasonable basis, that part of the decree will neither be affirmed nor reversed, but the case will be remanded in order that the commission may further consider the question of depreciation and make any changes in the rate schedule which may be necessary and requisite to yield to the company a fair and reasonable return upon the fair value of its property. So much of the decree as affirms that part of the order which extends the first fare zone of the Halethorpe line to the terminus thereof will be affirmed.

Decree affirmed in part and reversed in part and case remanded for further proceedings in accordance with the views expressed in this opinion, each party to pay one-half the costs.

The Public Service Commission has denied the request of the company that hearings be held on the depreciation issue in the fare case, pending action by the Supreme Court on the appeal taken by the United from the decision of the Maryland Court of Appeals. At the same time the commission has decided to ask the United States Supreme Court to review the action of the Court of Appeals on the depreciation issue and also on the question of how far the commission is required to go in granting fare increases to make up for losses caused by automobile competition. This, it is held, takes the entire case into the Supreme Court.

From Two-Man to One-Man in Indiana

The Indiana Service Corporation has been authorized by the Indiana Public Service Commission to change from two-man to one-man operation between Fort Wayne and Garrett and between Garrett and Kendallville, and Garrett and Waterloo.

Children Favored in Springfield

Under special permission of the Department of Public Utilities the Springfield Street Railway placed in effect in Springfield, Mass., on July 1 one-half rate children's tickets, selling in strips of five coupons for 25 cents. These tickets are to be used by children between the ages of five and fourteen and will be good until Sept. 3, 1928. This innovation will be to the advantage of children attending summer school sessions. They can purchase these tickets in preference to the pupil's 4½-cent tickets as the pupil's tickets are restricted to use only to and from school on days when school is in session, whereas the 5-cent tickets may be used any time and any where on the property.

Free Ride in South Bend

Through a special arrangement between the Chicago, South Bend & Northern Indiana Railway and leading downtown merchants, South Bend, Ind., shoppers were carried free of charge to and from the business district on city street cars on Tuesday morning, July 17. The "free ride day" is a repetition of the arrangement started last year by the railway. It resulted in a large increase in trade at local stores. Special bargains were advertised again this year and large throngs were reported at shopping centers.

Massachusetts Electrification to Be Finished by October

The Boston, Revere Beach & Lynn Railroad will be completely electrified by about Oct. 1, according to an announcement by the management. At that time more frequent service will be given between Boston and Lynn, Mass., and intermediate stations, including the beach stations. The road will have prepayment areas at the various stations, like the Boston Elevated.

100 per Cent One-Man Operation in Kansas City

THE last of the lines of the Kansas City Public Service Company, Kansas City, Mo., operated with two men to a car, namely, the line to Independence, Mo., was changed over on Sunday, July 15, to one-man operation, thus completing the program started on July 4, 1927, when the Country Club line was changed from two to one-man operation.

Prior to that time about 37 per cent of the company's car-hours and car-miles was one-man operated. Since July 4, 1927, the change-over has been made on an average of one line a month, and as now indicated the job is completed. Kansas City Public Service is now 100 per cent one-man operated, with more than 70,000 car-miles run a day. Moreover, the change to one man operation has been accomplished without laying off or dismissing any of the trainmen.

Counsel for Cincinnati Commission Under Fire

Edward D. Schorr, counsel for the Rapid Transit Commission of Cincinnati, Ohio, and chairman of the Republican Campaign Committee of that city, is to be tried on Aug. 7 by the Civil Service Commission of Cincinnati, a non-partisan body, to determine whether or not he has violated, an article of the city charter that forbids anyone in the city administrative service to have anything to do with political contributions or assessments. Mayor Seasongood, recently charged that Mr. Schorr must have violated this provision in the charter because as campaign manager he must have been concerned with political funds. Mr. Schorr refused to make a statement on July 19, but he has repeatedly said that, if it were not for the embarrassment it might cause his political party if he were to resign under fire, he would gladly give up the job.

Group Insurance in Memphis

The management of the Memphis Street Railway, Memphis, Tenn., recently entered into an agreement with the Metropolitan Life Insurance Company whereby its employees will benefit by insurance protection under the group plan. Without the necessity of a physical examination each employee is insured without cost to himself to the amount of $500, with the privilege of increasing the coverage up to a maximum amount of $2,500 graded according to length of service at a nominal cost payable monthly. Under the plan the named beneficiary receives the insurance, regardless of the nature of the death, and upon proof of total and permanent disability before the age of 60 years, the insurance will be payable in installments. In case of death before the insurance is fully paid the beneficiary receives the balance. In case of recovery the policy will be reduced by amount of the installments paid and continued in force in its reduced amount.

Hearing on Piedmont & Northern Case in Fall

The suit of the Piedmont & Northern Railway to set aside the recent refusal of the Interstate Commerce Commission to allow the electric railway to extend its lines from Spartanburg, S. C., to Gastonia and from Charlotte, N. C., to Winston-Salem, will be heard in Asheville beginning Oct. 2 before Circuit Judges Edmund Waddill, Jr., and Elliott Northcott and District Judge Morris A. Soper, Baltimore. Judge Soper made the announcement at Greenville, S. C., where the suit was originally filed. Charles Evans Hughes is chief counsel for the Piedmont & Northern.

What Could Hamilton, Ohio, Expect?

City which countenanced jitney and kept fares at 5 cents now seeks unification of services

City Councilmen and Russell P. Price, City Manager at Hamilton, Ohio, have agreed that a unified system is the only solution to the transportation problem in Hamilton. To bring about a unified system, Council has authorized the City Manager to receive proposals from bus companies and railways interested in handling transportation in the city as a single unit. Action to this end was taken after a detailed report had been submitted by the City Manager delineating the present situation and recommending improvements.

As an example it is cited that a solution would be brought about if the railway lines would take over all buses and issue transfers from bus routes to car routes. It also is cited that a unified system would be created if a merger between car lines and bus companies were formed. Mr. Price said in substance:

Eighty-two per cent of the riding public uses street cars. Car service alone is inadequate. Car lines cannot be extended, it is estimated, unless an increased car fare is granted. City officials, in all probability, would not permit an increase in car fares.

Eleven buses carry about 18 per cent of the riding public.

Buses are dilapidated, uninviting, unsanitary and unsafe.

A unified system would mean safe, sanitary, reliable and convenient transportation for the entire riding public of Hamilton.

Later, City Manager Price declared proposals received will be transmitted to the City Council for examination and approval. The report says:

The year 1921 saw the advent of the bus. Since this time Hamilton has grown steadily but its transportation facilities have not kept pace. True, new and better railway equipment has been added, but save in one instance, the lines have not been extended to meet the growing needs of the city.

The riding public of Hamilton is served through two channels of transportation:

1. The city street car lines operated by the Cincinnati, Hamilton & Dayton Railway, along regularly established routes.

2. Buses operated throughout the city by private individuals and under no definite plan or established routes.

Summarizing the present situation, we find a city that has grown in territory and population within the last seven years and a transportation system not commensurate with its growth; we find a railway system which has made practically no extensions to its lines within a period of five years; we find independent buses cruising, for the most part, on routes of their own choice; we find railway equipment in good shape but the service in itself inadequate unless certain extensions are made; we find buses transporting thousands of men, women, and children weekly, on which the owners, for the most part, carry insufficient liability insurance in the event of a serious or fatal collision.

Since its reorganization the railway has expended $250,000 in the reconstruction of tracks, the supplanting of the old dilapidated cars with new and modern one-man cars and in providing for a modern source of power supply. Service today, in so far as it extends, is on a par with similar service in other municipalities of the size of Hamilton, but nevertheless is inadequate to meet the needs of a city that is still growing.

Today about 82 per cent of the Hamilton riding public depends upon the street cars for transportation.

The question naturally arises: Why then does not the railway endeavor to secure a full 100 per cent of customers by extending its lines and expanding to meet growing needs?

I am not in position to answer for the officials of the railway, but our survey has included estimates from other cities, showing the probable cost of extending car lines to meet the present needs and those of the future. As a result I do not hesitate to estimate that a railway extension program such as would be needed here would involve a total expenditure of close to $500,000. If we city officials were private officials of a railway would we authorize the expenditure of $500,000 under a 5-cent fare? The answer goes without saying.

City Manager Price, and J. H. McClure, general manager of the Cincinnati, Hamilton & Dayton Railway, are in accord on the proposed unification of transportation in this city, for since Mr. Price recently outlined results of a survey Mr. McClure has agreed that extension of tracks would mean an increase in fare. In a statement being studied by officials, Mr. McClure said that the problem to be solved "is the provision at reasonable cost of satisfactory auxiliary service to C. H. & D. local railway lines." The statement is regarded as a bid for renewal of the franchise which expires on June 10, 1930, with a promise to establish bus lines as feeders to street cars.

Trial Operation in Philadelphia

New Broad Street subway to go into service Sept. 2 under temporary arrangement with the Philadelphia Rapid Transit

MAYOR MACKEY'S proposal that the Philadelphia Rapid Transit Company operate the city-built Broad Street subway, Philadelphia, Pa., for a 90-day trial period, beginning about Sept. 1, at the 8-cent, two for 15, fare, with transfer and exchange privileges, was accepted by the company on July 24. The Mayor's action as advanced in his proposal in a letter to Ralph T. Senter, president of the company, came as a surprise in City Hall, inasmuch as the Public Service Commission and the engineering firm of Ford, Bacon & Davis, New York, engaged by the city administration, had started a survey of the subway's earning power presumably as a basis for an operating agreement. The Mayor said immediate action was necessary.

In its answer the company objected to the imposition of $1,200,000 in carrying charges during the experimental period as asked by the Mayor unless a higher rate of fare were provided. It said that the potential earnings would not enable it to meet these charges, but suggested a figure of $600,000. In addition, Mr. Senter sought the option of cancelling the operating lease upon 24 hours' notice after the completion of the three months' period of trial operation. He said there would be no objection to the 24-hour recapture clause in the city's favor.

On July 25 the transportation committee of the Council passed a resolution urging Mayor Mackey to accept the company's offer of $600,000 for operating privileges during the three months' trial period. At this meeting the Mayor announced that he would be bound by the members' recommendation and would withdraw his proposal that the company meet the entire $1,200,000 carrying charges on the $87,656,000 construction cost of the tube during the initial operation. According to the Mayor the plan calls for free rides for the public in the subway on Sept. 1 and the actual opening on Sunday, Sept. 2.

The initial three months' lease will be substantially along the line recommended by J. Rowland Bibbins, utilities expert of Washington, D. C., who made a survey of the potential earning capacity of the subway at the request of the Kendrick Administration and is now employed by the Northeast Chamber of Commerce. Present transfer and exchange privileges will be maintained and the distribution of revenue between the tube and feeder lines will follow the practice in use throughout the country.

It was said that Ford, Bacon & Davis, engaged as consultants by the Mackey Administration, would audit the company accounts daily for the Department of City Transit during the trial period. The only point at issue on July 25 was the designation of Director Myers, of the Department of City Transit, as the auditing agent for the city during the trial operation. Mayor Mackey, in a prepared statement, said that Controller Hadley and the Philadelphia Rapid Transit Company at present were engaged in a controversy over the auditing of the P.R.T. books and the submission of annual reports, and that he had named Mr. Myers for the Broad Street subway check-up because he did not wish to take any position in the Hadley-P.R.T. discussion.

In a resolution offered by Edwin R. Cox, president of the City Council, it was suggested that the Mayor and City Solicitor Ashton meet P.R.T. officials at once to negotiate the experimental contract. When that document is drafted, Mr. Cox said, the Council will meet in special session to pass the necessary legislation. It is the consensus of opinion that the Public Service Commission will immediately approve the contract after the ordinance is passed by the Council and signed by the Mayor. The commission had already recommended that the city and the P.R.T. sign a short-term lease of this character.

Jitneys Must Leave Columbia Streets

Another snarl in the transportation tangle in Columbia, S. C., was unravelled recently when the State Supreme Court handed down an opinion refusing to enjoin the city of Columbia from enforcing an ordinance, recently passed, which "routes" the 10-cent jitneys. Jitney drivers had brought action against the city of Columbia in an effort to get an injunction against driving the jitney from the streets. By the terms of the ordinance, the City Council outlined certain routes which were to be assigned to jitneys as they applied for licenses to operate in Columbia. It was conceded that the strength of the jitney's popularity rested in its flexibility —it had no definite route, went anywhere and carried its passengers direct to their doors. The jitneys were usually operated by their owners, though a few men operated a fleet of three or four. They were required to stay on the streets for no stipulated time and went off according to the driver's will.

The chief justice of the Supreme Court, in dismissing the petition for an injunction against the enforcement of the measure, said:

> We think the ordinance in question should be sustained. It is essential and necessary for the welfare of the city of Columbia that it have regulated public transportation, operated upon regular routes and schedules.
>
> The city has the right to enact and enforce the ordinance in question. No one has the inherent right to carry on his private business along the public streets. Such rights can be exercised only under such terms and conditions as are imposed by the city authorities.

There are a few jitneys still in operation, but they run on definite routes. The city of Columbia is in a rather peculiar condition as to its streets, as the title to them is vested in the state of South Carolina and not in the city itself. The city was laid out for the capital of the state and the ownership of the streets left with the state, and this fact has been the cause of much litigation.

Street cars, unable to meet jitney competition, stopped operations in Columbia in March, 1927. Since that time buses and jitneys have fought for patronage. With the jitney disposed of, the buses, it is thought, will be able to expand their service. There is considerable complaint at the present time because of inadequate service.

No decision has yet been rendered in the matter of restoration of street car service. Some weeks ago a hearing was completed which had as its object the ordering of the Columbia Railway, Gas & Electric Company to resume street car service.

Graduates Awarded in Milwaukee

Exercises were held at 9:30 a. m. on June 25 at which certificates were awarded to men in the transportation department of The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., who took optional courses on their own time. Among those who received certificates were trainmen, supervisors, instructors and the assistant superintendent. The meetings for the awarding of certificates throughout the company were held by departments. This was the first year that courses were offered in the transportation department.

The program consisted of a light luncheon in the dining room and a meeting in the Lodge room adjacent. At the meeting there were talks by George Kuemmerlein, superintendent of transportation; Dr. Rowland, educational director, and two of the men receiving certificates, Messrs. Lamster, and Hackborth, division superintendent and chief instructor respectively. After the addresses the certificates were awarded individually by the superintendent of transportation. It was not possible for some of the men to attend because of working conditions.

Optional courses in the transportation department for 1927-28 included trainmen's English, trainmen's mathematics, a course on air brakes for the safety car, a course in electrical equipment on the safety car and one in electrical equipment on the interurban car and a course in motor bus problems. The total enrollment numbered 277 employees.

Those in attendance at graduation exercises in Milwaukee

Cars Chartered for Anniversary Sale in Nashville

A gratis trolley ride was afforded patrons of the Nashville Railway & Light Company, Nashville, Tenn., on May 7, the opening day of the 54th anniversary sale at Lebeck's store. The sale lasted through May 19. A schedule specifying times of departure of all cars from every section of the city on the trip to downtown Nashville was published in the *Tennessean* of May 6.

Twenty-seven Years Without a Fatality in Boston

Two persons were killed and 23 others were hurt on July 22 when a four-car train of the Boston Elevated Railway, Boston, Mass., running from Dudley Street to South Station left the rail at the curve entering the Beach Street unused station. The first car drove against the elevated structure of the southbound rail in an upright position. The second car swung across both northbound and southbound tracks practically upright, and the third and fourth cars remained approximately in position. There were 34 passengers on the train. Of the 23 persons taken to the hospitals all but two returned to their homes at once. The accident was the first instance of a passenger in an elevated train of the company being killed since the main line was opened on June 10, 1901.

The accident happened at approximately 7 p.m. in a heavy rain. The inspection, made at once, showed no evidence of a mechanical defect in car or track. The control handle was found in the "power on" position. All four cars were steel (there being no wooden elevated cars in service), the first car having been in service since 1922 and the second car since 1927. The first car was inspected on July 19 and the second car on July 21. The motorman has been in elevated train service for ten years and qualified as a motorman in 1927.

Community Service in Minneapolis Car Ad

An advertising card in Minneapolis, Minn., street cars entitled, "A Grudge Is Too Much of a Load for Any Man to Carry," was the subject of comment and praise by W. A. Evans, who runs a "How to Keep Well" column in the daily and Sunday Minneapolis *Journal*. He says that the placard is part of the educational community service of the Minneapolis Street Railway. The placard can be read easily by pedestrians on the sidewalks and by people in vehicles in the street. All ad writers who fight grouches are doing a big service, in the opinion of Mr. Evans, who cites the instance of Barron Collier's community service to Chicago twenty years ago in giving the Health Department the exclusive right to use space in each street car in Chicago free, in order to promote good health.

Finding in Hamilton Affects Fare and Wage

A recent finding of the Ontario Railway & Municipal Board affecting the fare schedule in Hamilton, Ont., provides for a cash fare of 7 cents, tickets four for 25 cents and children's fares ten tickets for 25 cents. The decision on the wages provided for a schedule for motormen and conductors in cents per hour as follows:

First year 42, second year 46, thereafter 52.

Bus and one-man car operators 5 cents per hour additional.

Time and one half for over time and work performed on legal holidays.

Another factor of live interest in Hamilton just now is the jitney. A lower court has declared that the jitneys are operating illegally, but an appeal has been made to a higher court, and pending the findings of this court, they continue to operate.

Bill for Extension of Boston Subway Signed

Governor Fuller of Massachusetts has signed the bill enacted by the Legislature for the extension of the Boylston Street subway under Governor Square to solve one of the difficult traffic problems on the Boston Elevated system. This is the only piece of legislation the Governor was able to obtain from the Senate and House relative to the Boston Elevated, although he was pressing hard for an Act to extend public control and to build new rapid transit lines. It is believed, however, that the foundation has been laid for legislation of this kind next year.

Under the new bill the city of Boston is to pay, out of taxes, one half of the cost of the Governor Square construction work, and the Boston Elevated Railway is to pay the other half of the income from fares. The bill is believed to be satisfactory to the Boston Elevated trustees and board of directors. It is subject to approval by Mayor Nichols of Boston.

Subway Plan Advanced in Pittsburgh

The City Council of Pittsburgh, Pa., expects to hold conferences soon with the municipal transit commission on the subway plans. As one of the commentators sees it the work of the transit commission has produced a real method of procedure that now looks ahead clearly, where before there was dilly-dallying and confusion. In this connection it has been recalled that a constitutional amendment is to be voted on this fall in connection with the proposition to open the way for the application of the district assessment plan. Under the latter there would be assessment of benefits upon property whether abutting the subway or not which would be specially benefited by its construction and operation.

This plan, it is estimated, would require $36,000,000, for which a bond issue of $6,000,000 already has been authorized. Under arrangement for use of the subways, the Pittsburgh Railways would be expected to take care of part of the financing. With the approval of the constitutional amendment, it would still be left to the citizens of Pittsburgh to say whether they wanted the district assessment plan to apply. Even under the most favorable procedure it would be unlikely that construction of the subway could start earlier than 1930.

Rehearing in St. Louis Fare Case Refused

The Missouri Public Service Commission on July 25 overruled motions by the city of St. Louis and the St. Louis Public Service Company in the 8-cent fare and valuation case. The city still has the right of appeal to the Circuit Court of Cole County. The company having been granted the fare rate requested in its original application has no such right of appeal, but can initiate entirely new proceedings.

The commission fixed the valuation of the company's property at $66,000,000. The company sought a valuation of $75,000,000 while the city contended $53,000,000 was sufficient. The company also sought a return of 8 per cent while the city held out for 7 per cent The commission fixed the return at 7.14 per cent.

The 8-cent fare for adults became effective July 1.

Sketches Wanted in Portland

A cash prize of $25 is to be awarded for the best "masthead" or illustration for the first page of *Watts Watt*, the pamphlet distributed on the cars of the Portland Electric Power Company, Portland, Ore. The contest is open to amateur, professional and student artists who have a sense of humor and know how to make a finished pen-and-ink drawing and to letter into the design the title, *Watts Watt*. Preference will be given to drawings which show the three major activities of the company and indicate action. The drawings must be designed to reduce to 3¼ in. in width and not more than 2¼ in. deep. The designs must be submitted not later than Aug. 15. They will be considered by three judges not connected with the Portland company.

News from Florida to Come Monthly

Publication of *Florida* by the Florida Public Utilities Information Bureau is being resumed, for the dissemination of news regarding the utility business in that state. It will cover also industrial, financial and agriculture features. The first issue, dated at Sanford, is an eight-page pamphlet. The editor says the utility plants of Florida are doing a job in development big enough to have publicity in that state and other states.

South Shore Line-Gary Railways Establish Fund to Aid Industries

An industrial financing fund of $200,000 for the purpose of aiding in local industrial development has been created by the Chicago, South Shore & South Bend Railroad and the Gary Railways in company with other subsidiaries of the Midland Utilities Company, Chicago. From this money will be loaned to customers and prospective customers and patrons of the several companies, as a means of aiding in the industrial expansion of the areas which they serve. According to the official announcement, loans will be made on such a basis that the total amount of loans outstanding at one time in any community using transportation service will not exceed $1 for each $300 of annual gross revenue derived in such community from passengers ticket sales for profitable interurban railway traffic. Money also will be lent to customer-industries in the discretion of the committee for other business purposes where the loan promises to assure or to increase the demands of such industries for utility service.

The plan of aiding in the industrial promotion of the communities served by these companies, says the announcement, is in line with the progressive policy of chambers of commerce in many cities throughout the country of assisting in the financing of worthy manufacturing enterprises.

In cities where some community plans on industrial financing are in effect, the companies will participate in the plan. In cities where such plans are not in operation, the companies will handle the matter through the local chamber of commerce or similar organizations, or direct with the manufacturers, depending upon the circumstances.

The administration of the new fund will be under the control of committees, but negotiations will be handled by the local representative of the company or companies in each community.

Londoners Visit the United States

Frank Pick, managing director of the London General Omnibus Company; O. J. Watson, development engineer of that company, and H. R. Fisher, engineer for the Associated Manufacturing Company, from which the London General Omnibus Company buys its equipment, are on a visit to the United States. They came over on the *Mauretania*, which also carried among its passengers Matthew R. Boylan, vice-president in charge of operation of the Public Service Co-ordinated Transport, Newark, N. J., and Martin Schreiber, general manager in charge of plant of the Newark company, who, as noted previously in the JOURNAL, studied transportation in London, Paris and Berlin while they were abroad.

Trans-Pyreneean Lines in France Being Electrified

With the opening of the so-called Pau - Laruns - Bedous - Canfranc - Jaca trans-Pyreneean railway in July, 1928, by the Midi Railway, the first of three proposed trans-Pyreneean routes will have been completed.

An agreement for the construction of this line, as well as for a line from Toulouse to Barcelona, via Axles-Termes-Latour de Carol, and a line from Saint Girons to Lerida, was reached by a convention between France and Spain, ratified in January, 1907, which fixed a ten year limit, afterwards extended, for completion of the two first-named projects, and for partial construction of the latter. The Toulouse-Barcelona railway, which on the French side is under construction by the Midi Railway, is expected to be completed next year.

Considerable work remains to be done on the trans-Pyreneean railway from Saint Girons to Lerida via the Salau Pass, and no prospective date of opening has been set. The point selected for traversing the mountains is about midway between the two other lines.

The program of railroad electrification that is being carried on by the Midi Railway throughout this part of France has been a factor of great importance in enabling work to be undertaken on the several trans-Pyreneean projects. Electric locomotives will be used entirely on the trains operating on the French side.

Madagascar Electrification Approved

Government approval has been given for the electrification of 39 miles of the Tananarive-East Coast Railway, Madagascar, at an estimated cost of £166,000, not including electric locomotives. The work will require about six years for completion. It is estimated that the entire line from Junck to Tananarive, which rises constantly through a mountainous country, could be electrified at a cost of £500,000, but at present only the section having the heaviest gradients and sharpest curves is included in the project.

Hungarian Railway Offers Bonds

Two classes of bonds were offered for subscription in London, England, on May 10, in the £2,300,000 loan of the Hungarian Trans-Danubian Electrical Company, to be used for the construction of a large power plant at Bashida and the electrification of the Budapest-Hegyeshalon (Vienna railway line).

Series A comprise £1,000,000 of 4½ per cent 25-year bonds, issued by the Bank of England at 97, and guaranteed by the British Government under the Trade Facilities Act. Series B consists of £1,300,000 of 6½ per cent 33-year bonds, issued by the Whitehall Trust Company, Ltd., London, at 93. The bonds of series A were taken over at 95½, those of series B at 89 by the issuing banks, which will also pay the British stamp tax. Bonds of both series will be registered bonds, their amortization beginning in four years. The revenues of the Hungarian State Railways are pledged as a security for capital and interest.

Tramways Support Schools in China

HAVING begun to pay small profits for the first time in its three-year history, the Peking Tramway has been selected by the government to pay the upkeep of 30 primary schools.

India Installs Suburban Electric Service

Electrified suburban service covering an area of about 39 miles has been opened in Bombay, India, by the Bombay, Baroda & Central India Railway. Power required for operation of the service is obtained from a hydro-electric generating station in the Western Ghat Mountains, about 100 miles from Bombay.

The electrification scheme is designed principally to meet the growth of traffic during the past few years. So far it has cost more than 20,000,000 rupees, or about $7,000,000, including the purchase of new rolling stock.

The same service is expected to be extended in the future to the Poona and Igatpure line of the Great Indian Peninsula Railway and probably electrification of most of the freight trains working in Bombay.

Southern Railway Extends Electrified Service

Additional sections of the suburban lines of the Southern Railway, London, England, were put into electric operation recently. About 79 miles of track are involved, half of which represents a conversion from the overhead wire, single-phase system to the third-rail system. The other half is a conversion from steam traction to the third-rail system. Equipment and appliances are similar to those on the lines already electrified.

The completion of electrification of the remaining lines embraced in the whole scheme is expected to be reached some time next year.

Air-Railway Freight Service in Switzerland

Establishment of co-operative railway and air freight service in Switzerland was provided for in an agreement signed on March 21, 1928, by the Swiss Federal Railways and the Basel Air Traffic Corporation on its own behalf and on behalf of the other air traffic companies licensed in Switzerland. The air lines are empowered to issue through bills of lading for the transport of merchandise from stations in Switzerland to foreign air ports and vice versa, both by air and rail, and also from one foreign air port to another in transit by rail through Switzerland. The bills of lading will stipulate what portion of the journey is to be covered by air and what portion by rail. Merchandise received by the railways from air lines will be transported as express, in order to insure prompt delivery.

The railways will receive a fee of 1 franc (19.3 cents) for each shipment delivered for transportation abroad, or for delivery in Switzerland, in addition to the usual freight rates and such other additional expenses as may accrue, while the air lines will receive their regular traffic charges based on tariffs now in effect.

This agreement, which became effective on May 1, 1928, continues indefinitely unless notice to terminate is given three months before Dec. 31, 1928. After that date it may only be terminated by either party giving six months' notice before the end of any calendar year.

Czechoslovakia To Build New Railway

Plans for the construction of a new electric railway line from Teplice-Sanov to Aussig are now under consideration by the Czechoslovak State Railways. Within four or five years it is also planned to electrify the Prague-Ceska-Trebova line.

Japanese Rapid Transit Line Organized

Construction of a rapid transit line between Gotanda, Japan, in Osaki-Machi, Tokyo, and Ura-Takashimacho, Yokohama, a distance of 14 miles, is to be made by the Tokyo-Yokohama Rapid Transit Electric Railway, Ltd. This company has just been formed with a capital of 10,000,000 yen (about $4,600,000).

9,000 Trousers a Year Issued in London

The London Underground group of railways has 4,500 employees, to whom it issues uniforms. As there are 4,500 men so employed, this means annually 9,000 trousers, 4,500 jackets, 4,500 hats, 2,250 overcoats (one every two years), beside 1,000 overalls for the motormen and porters.

Recent Bus Developments

Through Service in Massachusetts

Replacement of railway proposed by a new service more inclusive than that of former railway

AFTER several months of hearings, petitions and controversies, the Milford, Framingham & Uxbridge Coach Company in Massachusetts has been given a franchise to operate buses in Milford, Mass., by the Selectmen of that town.

Permission from the State Necessary

The officials of the coach company must now apply to the State Board of Public Utilities for permission to discontinue the trolley line and establish the bus service. The Medway and Milford trolley line, owned by the Milford, & Uxbridge Street Railway and controlled by the same financial interests that are acting as sponsor for the coach company, will be discontinued, the usual notices already having been posted.

The bus line will run as far as the town of Medway, thus enabling through service to Boston from Milford through connection with another bus line in that town. The through-service idea figured prominently in the controversy, the Selectmen insisting that the bus route be laid out so that this would be possible, having in mind that at Medway passengers of the coach company could get service from the Johnson Bus Company, which operates buses from Medway to Roxbury, on the outskirts of Boston.

Ten-Cent Fare Provided

The bus license specifically stipulates that there shall be a 10-cent fare instead of the proposed 13-cent fare on all of the company buses. In addition the fare from Lincoln Square to the Hopedale town line will be 5 cents. The Selectment were also given to understand that insofar as possible all employees of the railway will be kept in the service of the coach company.

As soon as the public utilities department takes action there will be an important bus development in Central Massachusetts, for the company plans to operate far beyond the confines of Milford. It plans through service for such towns as Framingham, Uxbridge and East Douglas. Milford was the only town between Framingham and East Douglas that delayed action on the coach company's request for a franchise. The delay in permitting the bus lines to get started was a blow to residents of those places for recently trolley service was abandoned between Framingham and Milford and Holliston town line between Hopedale and Uxbridge. The bus concern will operate where the trolleys have been taken off. The coach company has been granted permission to operate in Whitinsville, which was heretofore without a public transportation service.

When they first refused the coach company's petition the Milford Selectmen granted the Johnson Company the right to operate in the town if railway service ceased. The Johnson Company had already filed petitions in other towns on the through route proposed by the coach company. The officials in these towns, however, favored the coach company. It is understood the officials of the coach company and the Johnson Company will work out an amicable agreement covering the territory.

Hearings Re-opened on Chicago's Feeder Service

By re-opening on its own motion on July 14, hearings on the petition of the Chicago Surface Lines to operate motor coach feeders on the northwest side of the city of Chicago, the Illinois Commerce Commission has given itself an opportunity to reverse its own order allowing the Surface Lines to operate the buses, despite a recent court decision upholding the legality of that order. The explanation given by the commission for re-opening the case after it had been closed for several years was that it wanted to establish a definite policy on the operation of feeder buses by the Surface Lines.

The Chicago Surface Lines' original application to the commission for authority to operate co-ordinated bus service over Diversey Avenue was opposed by the Chicago Motor Coach Company, which simultaneously petitioned for a similar privilege. The railway offered a 7-cent fare with free transfers to electric cars, while the bus company proposed to establish its regular 10-cent fare. The commission, however, overruled the bus company's petition and entered an order in favor of the Surface Lines. Thereupon the bus company appealed to the Superior Court which, in a decision handed down recently, upheld the Commerce Commission.

Since feeder bus service was started in Chicago by the Surface Lines a year ago on Diversey Avenue, numerous attempts have been made by Aldermen and civic organizations to have additional feeder bus routes established in various parts of the city. Ordinances giving the Surface Lines permission to establish service on many of these routes have been approved by the City Council on several occasions, but have never been enacted.

The corporation counsel has been instructed by the city to appear before the commission in the present hearings to help the Surface Lines obtain the necessary authority to establish feeder bus lines on approximately twelve different northwest side routes, ordinances for which were adopted recently by the City Council.

Staten Island Bus Case Adjourned

Argument on the application of the Richmond Railways, Inc., which operates six electric railway lines on Staten Island, for an injunction to restrain the Tompkins Bus Corporation from operating its eight lines of buses there, and also to restrain the South Beach and the Fox Hills companies from operating their lines, was adjourned on July 24 before Supreme Court Justice Byrne in Brooklyn to July 30.

The railway holds that the franchise specified that the two-zone system, with a 5-cent fare in each, was to go into effect within 90 days after operation began. It also maintains that the Tompkins Bus Corporation has not posted a liability bond for $50,000 as required, and that it has failed to put new equipment into service after operating the system for one year.

Meanwhile the Tompkins company announced on July 23 that beginning the next day it would put into effect a two-zone fare system, charging 5 cents for a ride through each zone instead of a flat rate of 10 cents to all points. The history of this case has been reviewed recently in Electric Railway Journal.

Reduced Rates and Increased Services on Mitten Tours

The growing popularity of Mitten Tours bus travel to the shore at Atlantic City has necessitated greatly increased service and an auxiliary terminal and waiting room at 1432 Market Street opposite the Broad Street Station in Philadelphia, Pa., and has made possible a new reduced round trip rate. The constantly increasing demand for more frequent service has changed the schedule from every hour and one-half to every hour. The round trip rate is $2, but the one-way fare remains at $1.25.

As an added convenience to its patrons an auxiliary terminal and waiting room was opened on July 23 beside the Mitten Bank. Here tickets and reservations can be purchased for all Mitten Tours lines, including Atlantic City, New York, Washington, Wilmington, Doylestown and Easton, Valley Forge and the two long-distance summer tours, Buffalo-Niagara and Montreal-Quebec. Chartered bus service is also obtainable at this location.

Interurban Service May Replace Lake Burien Line

Solution for the Lake Burien car line problem of the Seattle, Wash., Municipal Street Railway system, which has vexed city officials, county commissioners and Lake Burien residents for months, may result from a hearing set for Aug. 22 at the Chamber of Commerce before the State Department of Public Works. The hearing is to be on an application of the Suburban Transportation System, Seattle, for a certificate of public convenience and necessity, to establish a passenger and

Digitized by Google

express service between Seattle and Lake Burien.

C. R. Jackson, superintendent of public utilities, told the City Council that if the state Department of Public Works grants a certificate to the Suburban Transportation System, the city will probably abandon the operation of its Lake Burien car line, which has been on a losing basis for a long time, and that there was not enough patronage for both services. He added that if the city continued this line, it was going to be compelled to shoulder an expense of close to $16,000 in the near future for replacements and improvements.

Permits for Camden-Atlantic City Service Denied

Heavy losses sustained by railroads in maintaining passenger service to Atlantic City was assigned by the Board of Public Utilities Commissioners of New Jersey as the reason for refusing to sanction the operation of buses between Camden and the shore resort by the Public Service Transportation Company.

The conclusions of the board dealt mainly with the situation confronting the Atlantic City Railroad, a part of the Reading System, and the West Jersey & Seashore, a subsidiary of the Pennsylvania. The commission said:

All the exhibits offered clearly indicate that the railroads are losing vast sums of money operating between Camden and Atlantic City. A considerable loss is caused by the continued increase in the number of privately owned automobiles and the continued increase in interstate bus transportation, which is without regulation and increases at will. Because of this situation, the railroads are maintaining service at a great loss, which will be increased by the addition of other transportation facilities.

The board quoted from a court decision to this effect:

The state assumes to regulate the rates for transportation and the character of the service rendered. Morally and legally it should protect the business of the established utility from impairment and encroachment. To do otherwise would soon creat a situation where the public would be without transportation service.

New Route in Massachusetts Announces Schedule

A bus service was scheduled for July 29, by the Springfield Street Railway to operate between Springfield and Palmer, Mass., and to take the place of the railway service, set to be discontinued on that date. Buses running from Springfield through Palmer to Ware and return will alternate with those running between Springfield and Worcester every two hours, thus providing an hourly service between Springfield and Palmer. Two short runs will be made each day between Ware and Palmer. Connections will be made at Palmer with buses for Monson, Three Rivers, Bondsville and Thorndike and through trips will be made between Springfield and Monson twice a day.

Thirty-nine Additional Buses on Newark Routes

The Board of Public Utility Commissioners of New Jersey on July 21 approved applications of the Public Service Co-ordinated Transport for authority to operate 39 additional buses on routes in and around Newark. On the Lyons Avenue route between Newark and Irvington seventeen buses will now be added.

There were 7,476,460 passengers carried on this route last year, a gain of more than 1,000,000 over preceding years. Thirteen additional buses are to be put on the crosstown route between Sixth Street and Heller Parkway and Lyons Avenue and Fabyan Place. This route carried 3,551,015 persons last year. The nine other buses are to be added to the Maple Avenue service between Newark and Hillside. This route handled 5,149,986 passengers in 1927.

Substitution on Old Springfield Line

The municipal transportation board of Springfield, Mass., has approved the Springfield Street Railway's plan to substitute a bus service for the electric line in use for many years on the Worthington Street route. This change, to be made in about two months, is incidental to the projected widening of Worthington Street. The question of removing the car tracks from Worthington Street is coming up for settlement.

Denver Tramway Uses Bus in Emergency

Precautionary measures have been taken by the city engineer of Denver, Col., and engineers of the Denver Tramway, which resulted in an edict closing, on 24 hours' notice to all traffic, the 23rd Street viaduct, an old wooden structure which spans a large area of railroad tracks and a small stream. Suspicion has been aroused that the structure was unsafe, although for many years there has been no occasion to raise any question about the matter.

The route of the Denver Tramway Line to Globeville, a densely populated eastside suburb, has been over the old wooden viaduct. The company now informs the public that from the Denver approach of this viaduct to the end of the Globeville line transfers will be issued which will be honored on buses the company has called into emergency service. While it will be impossible to cover the exact line, the bus will cover it as near as practicable.

Ordinance in Terre Haute Held Unreasonable

An ordinance of the city of Terre Haute, Ind., prohibiting buses from operating on the same streets with street cars and interurbans in that city was ruled void in an order written on June 23 by Howell Ellis, a member of the Indiana Public Service Commission. Mr. Ellis held that the ordinance was unreasonable and interfered with the petitioners' service to the public.

The case was filed in the name of the Blue & Gray Bus Lines and the Hoosier Transportation Company, Inc., against the city of Terre Haute.

Duplication of Service in Alabama Denied

Confronted with the question of whether a bus line should be permitted to duplicate the route an electric railway follows, the Public Service Commission of Alabama has granted the bus petition but has denied the motor carrier the right to duplicate the similar service of the railway. This question arose in connection with a petition filed with the commission by V. C. Hicks for a certificate to operate a bus line between Northport, Ala., and Holt, via Tuscaloosa, Alberta City and other intermediate points. This service, it is said, would duplicate that of the railway in Tuscaloosa and into Holt, and the Alabama Power Company, which operates the railway, intervened in the matter.

The Public Service Commission, in a report on the petition, grants the application for a certificate for the bus line, subject to certain conditions and restrictions which are, substantially, that the applicant may pick up passengers anywhere along the route if the destination is to some point more than a quarter of a mile distant from the railway line or he may pick up passengers along his route more than a quarter of a mile from the railway and discharge them at any point along his route.

In its report the commission holds that the principle that permits a bus and a railroad to operate on the same route does not apply as regards a bus and a street railway route. The commission gives notice that the applicant must keep his operations strictly within the terms and provisions of his certificate.

Would Operate Temporary Service in Long Beach

The Pacific Electric Railway has applied to the California Railroad Commission for a certificate of public convenience and necessity to operate a temporary auto stage service in the city of Long Beach, to and from the Pacific Southwest Exposition grounds.

Extension Sought in New Rochelle

The Country Transportation Company, subsidiary of the New York, Westchester & Boston Railway, applied to the Public Service Commission on July 17 for a certificate for the operation of an extension of its bus system in New Rochelle. According to the petition the proposed line will be operated as part of the bus company's main route from Dean Place to Stamford, Conn., the main-line buses traveling over the proposed extended route. New Rochelle

Digitized by Google

has authorized the bus company to operate in the streets on the proposed extension.

New Line from Worcester Approved

The Worcester Consolidated Street Railway, Worcester, Mass., has been granted permission by the license board to use the city streets for a bus line from Worcester to Holden and Jefferson. The first petition of the Consolidated for this route was refused because it contemplated use of Main Street, which is opposed by the license authorities.

Extension of Service in Los Angeles

A certificate of public convenience and necessity has been granted by the California Railroad Commission to the Los Angeles Railway Corporation to operate motor coaches for the transportation of passengers from the intersection of Clarendon Avenue and Pacific Boulevard in the city of Huntington Park to the city of Los Angeles.

Permit for Old Illinois Line Sought

An application has been made by the East St. Louis & Suburban Railway to the Illinois Commerce Commission for a permit to operate buses over the Old Belleville-St. Louis road between Belleville, Ill., and St. Louis, Mo. The proposed new line will not interfere with the present bus service between St. Louis and Belleville over the Belleville rock road which parallels the street car line. The Old Belleville-St. Louis road was paved recently. It is some distance from the rock road.

Debating Over Car or Bus on Denver Line

Officials of the Denver Tramway, Denver, Col., are conferring with a committee of the Eighteenth Street Business Men's Club on supplying some form of transportation down Eighteenth Street. About two years ago the company abandoned its service in Eighteenth Street Broadway to the Union Depot, about 1 mile. The club is now agitating for the restoration of the cars or the installation of buses. Opinion appears to be divided on the merit of the two systems.

Track Removal in Asbury Ordered

The Coast Cities Electric Railway, Asbury Park, N. J., has been ordered by the Public Utilities Commission to remove its tracks at Asbury Park within 90 days. These were abandoned recently when buses were substituted by the railway for cars as part of its extensive service.

Financial and Corporate

Good Interborough Statement

Earnings and expenses of the Interborough Rapid Transit Company, New York, for the twelve months ended June 30, 1928, show, on the basis of the preferential deficits as computed by the company, a net balance of $3,021,582 after actual maintenance. This is a gain of $1,550,695 in net earnings over the previous fiscal year, accounted for chiefly by the absence of strike conditions as of July, 1926—the beginning of the previous fiscal year.

The statement calls attention to the fact that the Transit Commission has objected to certain expenditures by the company in prior years, aggregating about $7,000,000, and that these objections have not been adjudicated. In consequence the results are approximate and tentative, and subject to such readjustment as may be necessary by the final settlement of the objections made by the commission. It is indicated that such settlement may show a portion of the balance after actual maintenance payable to the city, thereby reducing the balance available to the Interborough system.

In any event whatever balance may finally accrue to the Interborough system must be reserved for or spent in payment of past due taxes, deferred payments on account of cars now in service, and to provide additional equipment for which no other funds are available. Therefore, no part of the balance is available to the Interborough stockholder as return on the investment.

St. Paul Southern Sold

Subject to approval by Judge W. A. Schultz, all of the property of the St. Paul Southern Railway was sold by Receiver C. B. Kuckler on July 16 at the Dakota County Court House to C. Rieger, St. Paul, for $30,250. The road has been in a receivership since February, 1918. The award was protested by Charles Davis, Minneapolis, who charged he had put in a bid at $30,750.

STATISTICS OF SOUTHERN PACIFIC ELECTRIC STREET AND SUBURBAN PASSENGER SERVICE, YEAR ENDED DEC. 31

	1927	1926
Average miles of road operated during year	65.33	74.52
Operating revenues*	$1,820,789	$2,019,968
Operating expenses	$2,463,293	$2,623,844
Net deficit from operations	$642,504	$603,876
Railway tax accruals	$157,520	$156,177
Motor car-miles	3,636,616	4,085,374
Motor car trailer-miles	886,063	932,098
Motor car train-miles	2,774,719	3,165,248
Passengers carried—revenue	24,759,927	27,100,620
Passenger-miles—revenue	121,001,587	126,751,099
Passengers per train	43.61	40.04
Average distance carried—revenue passengers	4.89	4.68
Revenue per passenger-mile, cents	1.485	1.581

Note:—*Includes revenues, other than passenger, amounting to $23,921 for 1927 and $15,719 for 1926.

The road just now sold operates between St. Paul and Hastings, running into the city from a point south of South St. Paul over the rails of the St. Paul City Railway.

Additional Rights to Class A Central Public Service Stock

Stockholders of the Central Public Service Corporation, Chicago, Ill., approved amendments on July 9 which vest full powers of participation in the future growth and earnings of the properties of the corporation in its class A stock. It is said the reclassification of the class A stock is only the first step toward a readjustment of the capital structure of the corporation in order to facilitate the financing of properties for growth.

Heretofore the class A stock has been limited to $2.50 a share annual dividends and $25 a share in the event of liquidation. As a result of the amendment, it had priority over the common stock to the extent of $1.75 a share yearly in dividends and $30 a share in liquidation, and will participate equally with the common stock when that stock has received a sum equivalent to the priorities of the class A stock. The company is a large owner of electric railway properties.

Funds Deposited in Chicago for Bond Payments

The Chicago City Railway and the Calumet & South Chicago Railway, comprising the south side divisions of the Chicago Surface Lines system, have deposited with the First Trust & Savings Bank, Chicago, funds for the payment on Aug. 1 of interest on the first mortgage 5 per cent gold bonds for the preceding six-months' period.

Underlying Companies in Philadelphia Protest City's Plan

Counsel for the companies which underlie the Philadelphia Rapid Transit Company, Philadelphia, Pa., filed replies on July 16 before the Public Service Commission at Harrisburg, opposing the plan of the city to purchase the properties.

The principal brief was prepared by Owen J. Roberts. It attacked the Daix Act of 1927, under which the proceedings are being conducted, and the whole plan in general as in violation of both the state and federal constitutions, and asked the commission to dismiss the city's petition. Mr. Roberts charged that the Daix Act confers condemnation powers for a purpose "other than a public improvement."

The brief complains that condemna-

Digitized by Google

tion of the underliers' property and lines would violate property and contract rights guaranteed by the state constitution and that the Daix Act, although giving the city authority to take its present action, made no provision for ascertaining and paying the value of the property by the city.

Further, the present action, it is contended in the brief, would violate provisions of the state constitution which prohibit the Legislature from passing any law impairing the obligation of contracts and would likewise violate the federal constitution by depriving the underliers of property "without due process of law."

The city wants to assume ownership of the companies, and so receive from the Philadelphia Rapid Transit Company the fixed rentals now paid to them. Besides paying interest and sinking fund charges on a bond issue to cover the purchase, it has been estimated the city treasury would receive approximately $4,000,000 annually.

The hearing has been continued until July 31 at the request of the counsel for the companies that owing to the vast amount of work necessary in preparation of their case, they were not prepared as yet to submit any testimony to the commission nor to cross-examine any of the city's witnesses.

Dividend Passed

Directors of Union Street Railway, New Bedford, Mass., have voted to pass the $1.50 quarterly dividend due at this time, the recent textile strike having so affected earnings that the dividend was not earned in the past quarter.

Historic Pennsylvania Property Passes Into New Hands

The Allentown & Reading Traction Company, which has a terminus at Center Square, Allentown, and also in Reading, Pa., and which has for many years been operated between the seats of the neighboring counties, has just been sold to Marshall V. Robb, of Indianapolis, Ind., well known in the public utility business in the Middle West, who will continue to operate the road. Negotiations for purchase of the railway property have been in progress for the past year, and it is said that more than $750,000 in securities are involved. Included with the property are about 40 miles of railway as well as the Fleetwood and Kutztown Light, Heat & Power Company.

With the completion of the sale, the new officers are as follows: Marshall V. Robb, Indianapolis, president; Judge Edgar S. Richardson, Reading, vice-president; Francis S. Kinsey, Reading, secretary, and Milton Heffner, superintendent. The offices of the company, which have been maintained at 121 North Fifth Street, Reading, will be continued.

The company has 36 cars in service and maintains an hourly schedule between Reading and Allentown. There is at present a half-hour service between Allentown and Wescoesville, and two cars run every five minutes between Allentown and Dorney Park on Saturday and Sunday. The Dorney amusement park, near Allentown, on which Robert Plarr and R. J. Rush have a long-term lease, is owned outright by the railway company. The park adds to the railway traffic, especially from the Allentown end of the road, while as a picnic center, it is also well patronized from Kutztown and other nearby spots. From Reading to Temple, the cars are operated over the lines of the Reading Transit Company. Power for the lines is purchased from the Metropolitan Edison Company, which also supplies power to the Fleetwood and Kutztown Electric Light, Heat & Power Company.

The Allentown & Reading Traction Company has a remarkable history among the transportation systems of the country. The line was opened from Allentown to Wescoesville in 1900. Three years later, the road was extended to Temple and run into Reading. The late H. E. Ahrens, father of William B. Ahrens, a member of the board of directors, was president of the company from 1904 to 1918. At his death, George B. Schaeffer was elected president, and has served continuously ever since. F. S. Kinsey, who became secretary of the company, has been in charge of the Reading office since 1902, and Milton H. Heffner, superintendent, has been with the road since 1901.

Southeastern Buys Properties

The Southeastern Power & Light Company is reported to be acquiring the controlling interest in the Augusta-Aiken Railway & Electric Corporation and the Georgia-Carolina Power Company. F. B. Culley, general manager of the two concerns being absorbed, would reveal none of the financial details but stated that "stabilization of power service in all cities and towns served" was contemplated.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Lincoln Equipment Sold

Equipment of the municipally owned railway at Lincoln, Ill., has been sold for $3,500 to Morris Tick Company, Bloomington, Ill., and will be removed within 45 days, according to terms of the sale. The equipment offered included trolley wires, street cars, poles and tracks on unpaved streets. Rails on the paved streets will be sold later. Railway service was suspended on May 15.

Hearing on Substitution on Illinois Line

A commissioner of the Illinois Commerce Commission conducted a public hearing on July 23 at O'Fallon, Ill., on the application of the East St. Louis & Suburban Railway to discontinue railway service and substitute buses connecting St. Louis, O'Fallon and Lebanon, Ill.

Would Abandon Freight Car Service in Ohio

The Columbus Railway, Power & Light Company, Columbus, Ohio, has petitioned the State Public Utilities Commission for permission to abandon the freight car service maintained be-

Digitized by Google

tween Columbus and Westerville. Residents of Westerville are preparing to make protests. Some time ago the Westerville Village Council refused to ratify a contract with the Buckeye Stages, Inc., for bus service to the community largely on the grounds that the bus company could not duplicate the freight service of the Columbus Railway, Power & Light Company, which remains the sole agency other than the Pennsylvania Railroad then providing transportation.

The railway alleges in its petition that the freight service which influenced the Westerville Council in its action is unprofitable and could be handled satisfactorily by the railroad. Westerville is 15 miles from Columbus.

Decrease in Net Earnings in Twin Cities

A decrease of $164,205 in the net income of the Twin City Rapid Transit Company, Minneapolis, Minn., for the year ended Dec. 31, 1927, over a similar period ended in 1926 was revealed in the annual report of the company submitted by Horace Lowry, president. In 1927 the net income was $1,272,600 compared with $1,436,805 for the year 1926. The continued falling off in traffic is seen as the reason for decreased revenues. In 1927 a total of 177,319,024 revenue passengers were carried against 185,711,950 carried the year previous. The balance on Jan. 1, 1927, was $1,962,905 and additions for the year were $1,272,600. The balance carried forward was $3,235,505.

CONSOLIDATED INCOME STATEMENT OF THE TWIN CITY RAPID TRANSIT COMPANY

	1927	1926
Revenue from transportation	$13,287,479	$13,825,851
Revenue from other operations	138,164	119,415
Total operating revenue	$13,425,643	$13,945,266

Total deductions from gross income	$1,002,207	$1,013,355
Net income transferred to profit and loss	$1,272,600	$1,436,805

During 1928 there will mature $15,000,000 of the bonds of the Minneapolis Street Railway and of the St. Paul City Railway, $5,000,000 on Aug. 15, and $10,000,000 on Oct. 1, 1928. The board of directors felt that advantage should be taken of the favorable money market during December, 1927, and arrangements were made for refunding these bonds. At a special meeting held Nov. 16, 1927, the directors after full consideration, by unanimous vote of all present, authorized the sale of $18,000,000 par value of first lien and refunding 5½ per cent gold bonds of the Twin City Rapid Transit Company, dated Dec. 1, 1927, and due Dec. 1, 1952, secured by the pledge of an equal aggregate amount of first and refunding mortgage 5½ per cent gold bonds of the Minneapolis Street Railway and refunding mortgage 5½ per cent gold bonds of the St. Paul City Railway. The net proceeds from the sale of these bonds in excess of the amount required for the redemption of the bonds maturing in 1928 will be used for the future requirements of the company.

During the year the Twin City Motor Bus Company further unified its operations and with the new garages and improved shop facilities, Mr. Lowry says, is now on an economical operating basis.

STATISTICAL STATEMENT OF THE TWIN CITY RAPID TRANSIT COMPANY

Track miles, all track reduced to single track	511.81
Total car miles operated	29,136,626
Gross passenger car revenue	$12,068,273
Revenue passengers carried	177,319,024
Transfer passengers carried	65,784,323
Revenue passengers per car-mile	6.09
Total passengers per car-mile	8.34

ADDITIONS AND RETIREMENTS OF TWIN CITY RAPID TRANSIT COMPANY
1927

Additions:	
Way and structures	$492,182
Equipment	363,725
Power	40,183
General and miscellaneous	36,597
Boats, park and real estate properties	—481
Bus plant and equipment	270,908

Retirements:	
Way and structures	$165,044
Equipment	148,548
Power	15,250
Bus plant and equipment	149,749
Total retirements	$478,592
Net additions	$724,523

Detroit United Sale Set for Sept. 5

An order for foreclosure of mortgages amounting to approximately $11,000,000 and for the sale at public auction of the properties of the Detroit United Railway, Detroit, Mich., was issued on July 25 by Federal Judge Charles C. Simmons. The order was applied for by the Union Trust Company, Detroit, and the Central Union Trust Company, New York. The sale was set for Sept. 5.

Short Abandonment in Utica Approved

The Public Service Commission on July 20 approved abandonment by the New York State Railways of two parts of its line in Utica.

Loss Reported by Peninsular Railway

The Peninsular Railway, operating in San Jose, Los Gatos, Palo Alto and vicinity, reports to the California Railroad Commission its 1927 operating revenue at $242,722 compared with $248,616 for 1926. Operating expenses, excluding taxes for 1927 are reported at $420,372, and at $327,257 for 1926, leaving a net operating revenue a loss of $177,649 for 1927 compared with a loss of $78,640 for 1926. During 1927 taxes charged to operation amounted to $11,861 and for 1926 to $12,312. Deducting the taxes leaves operating income a loss of $189,511 for 1927 compared with a loss of $90,952 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, (which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus), a loss of $152,636 for 1927, and a loss of $51,295 for 1926.

Increase in Passenger Traffic in Glasgow

Glasgow Corporation Tramways, for the year ended May 31, reports as follows:

	1928	1927
Traffic receipts	£2,380,763	£2,340,837
Other receipts	5,165	4,370
Total income	£2,385,929	£2,345,207
Working expenses (excluding depreciation)	1,660,055	1,676,417
Balance carried to net revenue account	£725,874	£668,790
Interest on investments	85,876	75,020
Balance	£811,749	£743,810

From these sums there were deducted for interest, sinking fund, income tax, parliamentary expenses, depreciation and renewals, in 1928, £764,803, and in 1927, £776,988, giving a surplus in 1928 of £46,946 and a deficit in 1927 of £33,178. The subway and buses showed a deficit each year. When this deficit was deducted from the balance previously given, the final net surplus in 1928 was £19,754 and net deficit in 1927 was £78,632. The passengers carried increased from 419,970,823 in 1927 to 466,142,258 in 1928.

On May 31, 1928, the tramways had 131 miles of double track and 5 miles of single track, 1,089 passenger cars and 43 buses. Other buses were on order, including 100 double-deck buses ordered on April 26, 1928. On May 31, 1928, the traffic department had 4,417 male employees and 206 female employees. The rate of pay for the male motormen and conductors was 56 shillings a week during the first year, increasing to a maximum of 64 shillings in the fifth year. The women conductors were paid 53 shillings a week during each year.

Personal Items

Changes in Pittsburgh Line-Up

Promotions on the Pittsburgh Railways and Pittsburgh Motor Coach Company, Pittsburgh, Pa., are as follows:

Thomas E. Alderdice, formerly superintendent of shops of the railways, now superintendent of equipment Pittsburgh Motor Coach Company.

Richard C. Gilmartin from the position of special coach representative to superintendent of motor coach transportation.

Kenneth W. McPherson, formerly engineer of power equipment, Pittsburgh Railways, to superintendent of shops.

Daniel H. Bell from supervisor of construction to engineer of power equipment in the railways.

Thomas E. Alderdice has a background of nineteen years of varied experience with the railway companies.

T. E. Alderdice

He started with the Pittsburgh Railways in October, 1909, holding various positions and beginning in 1924 a series of five yearly successive steps as foreman of the machine shop, superintendent of the Homewood shop, superintendent of maintenance, superintendent of all shops, and finally to this new position.

R. C. Gilmartin went with the Pittsburgh Motor Coach Company on May 1, 1927, after six years' service with the United Electric Light Company at Wilmerding, Pa. He attended Duquesne University.

K. W. McPherson, who succeeds Mr. Alderdice, started with the railways as drill-press hand at the Homewood shop in 1914. Some years later he was appointed engineer of all four inclines operated by the railways. In 1921 he was promoted to the office of superintendent of inclines, where he served until 1925, when returned to the street-car end of the business to be engineer of car equipment. Mr. McPherson is a civil engineer of the class of 1909, Cornell University.

Daniel Bell, who replaces Mr. McPherson, began his employment with the Pittsburgh Railways as student draftsman in January, 1920. He was graduated from the University of Pittsburgh in mechanical engineering. In 1922 he was made instructor of the mechanical department at the Homewood shop, and then served successively as engineering inspector, chief inspector, supervisor of overhaul, and supervisor of construction.

Announcement of the appointments of Messrs. Alderdice and Gilmartin was made by T. W. Noonan, general manager of the Pittsburgh Motor Coach Company.

Changes in Brazil

C. A. Sylvester, for many years general manager of The Rio de Janeiro Tramway, Light & Power Company, Ltd., of Brazil, South America, has been elected a director and vice-president.

J. M. Bell, for many years connected with the subsidiary companies, and more recently assistant general manager of The Sao Paulo Tramway, Light & Power Company, Ltd., Sao Paulo, Brazil, has been appointed general manager succeeding Mr. Sylvester.

Promotion for L. A. Magraw

L. A. Magraw, vice-president and general manager of the Macon Railway & Light Company, Macon, Ga., has been elected vice-president and general manager of the South Carolina Power Company Charleston, S. C. B. R. Chestney has been elected to succeed him at Macon.

Changes in Key System Officers

Following a meeting of the board of directors of the Key System Transit Company, Oakland, Cal., held on July 26, it was announced that W. R. Alberger had resigned as a director of the company and that his resignation had been accepted.

Another announcement was the retirement of Frank W. Frost as secretary-treasurer. He is one of the oldest Key System officials in years of service.

Angus Clark, assistant under Mr. Frost, is the new secretary-treasurer. Mr. Clark also was elected a director, to succeed Mr. Alberger.

Mr. Alberger was formerly vice-president and general manager of the railway, but gave way to George W. Harris three years ago, though retaining his directorship. He was connected with the company for twelve years. Mr. Harris resigned a year ago and the position he had filled was abolished.

The changes are in line with the new policy of the company, now controlled by the San Francisco brokerage firm of J. Barth & Company, of electing active officers of the Key System as members of the board of directors.

Engineer in Automotive Field

Of interest to the electric railway industry as well as the automotive and industrial fields, is the recent affiliation of Harold T. Heath with James A. Carson, of the Timesaver Products Company, Chicago, Ill. The company produces a compound called "Timesaver," for the finishing of bearing surfaces and employed largely in the automotive and industrial fields.

Mr. Heath is better known in Mid-Western railway circles. He entered the employ of the Westinghouse Electric & Manufacturing Company and served in the railway, engineering, and sales departments until 1917, when he went with the Economy Electric Devices Company. Four years later he took over the management of the Heath Drug Company, founded by his father. In 1925 Mr. Heath became associated with the National Railway Appliance Company as general manager of the Chicago office, the Hegeman-Castle Corporation, as the concern is known locally. For a time following this, he

H. T. Heath

was associated with E. J. Hunt of the Detroit Railway Supply Company. More recently he has been with the Illinois Motive Equipment Company as sales engineer.

Mr. Heath was graduated from the Ohio State University in 1911, with the degree of mechanical engineer in electrical engineering.

J. J. Esch to Practice Law

J. J. Esch, who recently retired as a member of the Interstate Commerce Commission, has become associated with a new law firm, Esch, Kerr, Newton & Shipe, for the general practice of law before the departments and commissions at Washington, D. C. Associated with him will be Charles Kerr, former judge of the circuit court at Lexington, Ky., and of the United States Court at Panama; A. K. Shipe, former special assistant to the attorney general of the United States; Cleveland A. Newton, general counsel of the Mississippi Valley Waterways Association; Marion C. Early, and Robert W. Woolley, also a former member of the Interstate Commerce Commission.

E. B. Katté

New York Central official had done much to advance the technical arts, particularly the application of electricity to heavy railroading

EDWIN B. KATTÉ, chief engineer of electric traction of the New York Central Railroad, died at his home in Irvington, N. Y., on July 19, after an illness of more than a year. He had held the position of chief engineer of electric traction with the New York Central since November, 1906, and in that capacity he had charge of the design, construction and operation of the electric traction installation of the company in and about the city of New York. Previously, he had been electrical engineer and secretary of the electric traction commission of the New York Central Railroad, to which position he was appointed in December, 1902. In this capacity, under the direction of the commission, he had immediate charge of the electrical and mechanical engineering corps engaged upon the work of electrification of the various lines of the company in New York City and the vicinity.

E. B. Katté

Mr. Katté was born in St. Louis, Mo., on Oct. 16, 1871. He was the son of the late Colonel Walter Katté, a distinguished civil engineer. E. B. Katté was graduated from Sibley College, Cornell University, in 1893, with the degree of mechanical engineer, and after a post-graduate course, received from that institution in 1894, the degree of master of mechanical engineering. After a short term of service with H. R. Worthington, Mr. Katté became assistant engineer in charge of the erection of the superstructure of the Park Avenue viaduct of the New York Central Railroad. Later he was appointed mechanical engineer in the engineering department of the company and in this capacity had a great deal to do with the design and installation of numerous coaling stations, water supply stations, electric light and power plants for small passenger and freight stations, etc. It was the high grade of work done in this capacity and his knowledge of electrical engineering which led to his appointment as engineer and secretary of the electric traction commission, when it was decided to equip the New York Terminal for electric operation, as mentioned.

Mr. Katté always took an interest in association activities. He was vice-president of the Society of Mechanical Engineers in 1913-1914, and also served a term as manager. He was a fellow of the American Institute of Electrical Engineers and had served on the railroad committee of that body. With the American Electric Railway Association, he served on the heavy traction committee, the committee on standards, and the committee on electrolysis. With the American Railway Engineering Association, he served one term as director and for nine years was chairman of its committee on electricity; with the American Railway Association as a member of the committee on electrical working; with the New York Railroad Club as chairman of its electrical committee and with the New York Electrical Society as president for one term and vice-president for several terms.

During the war, Mr. Katté was chief engineer of electric traction for the United States Railroad Administration, and from 1917 to 1919, he was a major in the Engineer Officers Reserve Corps of the United States Army.

Captain Alfred Loewenstein

Following the war there flashed in the financial skies of Europe several individuals whose stars seemed to be of first magnitude. It appeared to be their opportunity and they seized it. But ambition to attain an office and the ability to fill it are two very different things, forcefully illustrated in the case of this latest triumvirate, from Roumania, Germany and Belgium, to the last of whom the world has given its *coup de grâce*. Reference is made, of course, to Captain Alfred Loewenstein, the spectacular Belgian financier and man of mystery, the finding of whose body has removed all doubts about his recent disappearance.

To the American people he was a newspaper-made Midas. Little was known of him here until he came to this country several months ago, heralded by the press as richer than Rockefeller or Ford. His personal attire, his numerous secretaries, his squad of motor cars, unusually large telephone and cable charges, all were minutely described as peculiarities that can be attributed only to extreme wealth and the habits of a man of big affairs. For a time he appeared to loom large here on the public utility horizon, but only for a time. So meteoric was the rise of the star of this man that his passing cannot be dismissed with just a line or two. As the *Financial World* said of him:

> The tragic fate that has overcome him again brings to the fore the fact that supermen are no more immune from disaster when they undertake more than the average human mind can master than is the common run of mankind. That was Captain Loewenstein's chief weakness. Intoxicated by his success as a promoter and exploiter, he foolishly thought, as did Napoleon, that there were no worlds he could not conquer. It is not possible to run a one-man band and make it as symphonious as a full orchestra. It is best and safest to do one thing at a time and do that well.

Equally significant is the penetrating comment of the conservative *Commercial and Financial Chronicle*, which, under the heading, "The Dizzy Heights of Finance," said among other things:

> The sudden, spectacular and tragic death of Alfred Loewenstein, European financier, master of millions, suggests a phase of the responsibility of wealth not often considered. Indeed, there is a sort of symbolism in this death that raises the thought of its inevitability. Here was a man who rose rapidly to the dizzy heights of finance, wherefrom there is no escape save by a sudden return to the solid earth of lowly things. He lived like a prince. He engaged in the game of great combinations of capital. From height to height he climbed, forgetting to mark the pathway for a safe descent, and when there were no more heights to climb, and the rarefied air was insufficient to sustain the life of new and larger enterprises, he fell—and carried thousands of innocent investors down to the plains of hard work—himself the victim of overweening ambition, whether death was accidental or otherwise.

The *Chronicle* also delivered itself of this homily:

> Combinations of corporations must be so close, so firm, so fitted to the purpose of human service, that one man's death will not affect their usefulness or standing. Real restraint begins with the restraint of ambition. Few men are fitted for this aggrandizement of power. Mere ability to organize and combine is not a test. The true test is fitness of the enterprise to sustain itself on its own merits by service.

Sir Thomas White has been elected to the Mexican Light & Power Company board and C. D. Magee to the board of the Mexico Tramways to succeed Captain Loewenstein. Both are residents of Toronto.

William Pestell

William Pestell, vice-president and sales manager of the Riley Stoker Corporation, Worcester, Mass., died on July 10. Mr. Pestell was stricken while on a business trip, being found dead in his Pullman berth as the train was entering New Orleans.

Since 1914 he had been employed by the Riley Stoker Corporation, first as district manager, then as sales manager, and since 1927 as vice-president. Before going with the Riley Stoker Corporation, he was superintendent of power for the Lynn & Boston Street Railway, Boston, Mass., and superintendent of the power houses of the Rhode Island Company at Providence. He was connected for several years with the Allis-Chalmers Manufacturing Company at Boston, and the J. G. White Engineering Corporation in New York. He also served as superintendent of power of the Worcester Consolidated Street Railway, Worcester, Mass. He was born in Rutland, England, 56 years ago.

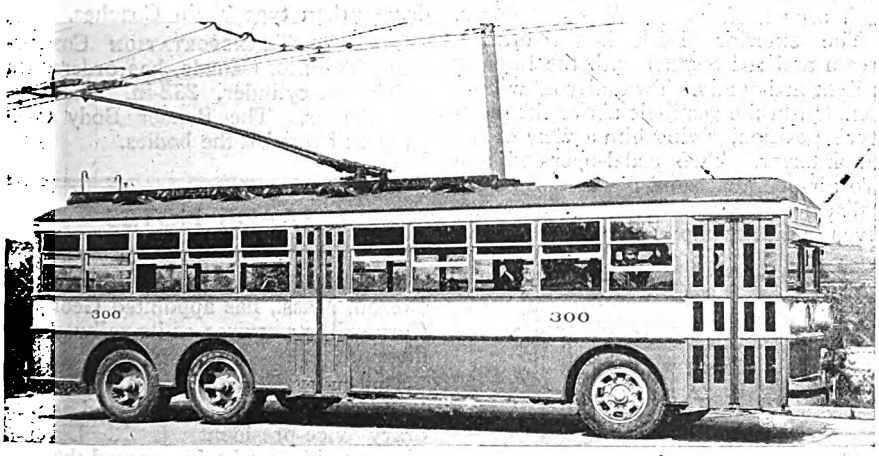
Manufactures and the Markets

Electric Coach for Salt Lake City Tested

One of the ten electric coaches built for the Utah Light & Traction Company by the Versare Corporation, Albany, N. Y., was given an operating test on July 23 under the personal supervision of E. A. Boyd, superintendent of equipment of the Salt Lake City company. The test was made to check the actual performance of the vehicle. It was conducted in Cohoes, N. Y., over trackless trolley lines of the Capital District Transportation Company, bus operating subsidiary of the United Traction Company, Albany, N. Y. Use of the lines was made possible through the courtesy of Ernest Murphy, general manager of the latter company.

The streets over which the vehicle was driven are very hilly and in certain districts quite rough. One of the hills along the route of the test is approximately a mile long, with an average grade of about 7 per cent and a maximum grade of 10 per cent. In the downtown section of Cohoes the streets are quite narrow and many sharp turns had to be made. According to those who witnessed the trial, the vehicle met every expectation and performed in a very satisfactory manner.

The first coach will be shipped to Salt Lake City during the first week in August and the other nine a few days later. All are expected to be in operation before the end of August.



Citizens of Salt Lake will soon ride in vehicles of this type on some lines

R. E. Miller General Engineer of Westinghouse Air Brake

Raymond E. Miller, assistant chief engineer of the Westinghouse Air Brake Company at Wilderming, Pa., has been appointed general engineer of the company, succeeding the late F. H. Parke. Mr. Miller is well known in the railway industry through his connection with the Westinghouse Air Brake organization for the past 22 years. He entered the company's service as a special apprentice immediately after his graduation as an electrical engineer from the Michigan University in 1906. During the succeeding years he advanced rapidly until he was appointed assistant chief engineer in 1926. His work has largely been devoted to air brake trials and tests of newly developed brake improvements.

New Stone & Webster Affiliation Includes McClellan & Junkersfeld

The Stone & Webster Engineering Corporation has been formed with a capitalization of $9,500,000, to take over from Stone & Webster, Inc., its construction and engineering business and its interest in Ulen & Company. The new company also has acquired from the North American Company its engineering and construction company known as McClellan & Junkersfeld, Inc., thereby widening the scope of the construction work of the new Stone & Webster subsidiary.

As a result of this segregation of its engineering work, the Stone & Webster organization will be more directly concerned with the management and ownership of public utility companies.

G. O. Muhlfeld has been elected president of the new company.

Motor Equipments from Westinghouse for Three Installations

The Pacific Electric Railway, Los Angeles, Cal., has ordered equipments from the Westinghouse Electric & Manufacturing Company for ten new all-steel cars for the Hollywood line. Each equipment consists of four Westinghouse type 532 motors, 50 hp., and HL control arranged for multiple-unit operation. These equipments duplicate a total of 150 equipments that have been ordered within the past six years by the Pacific Electric.

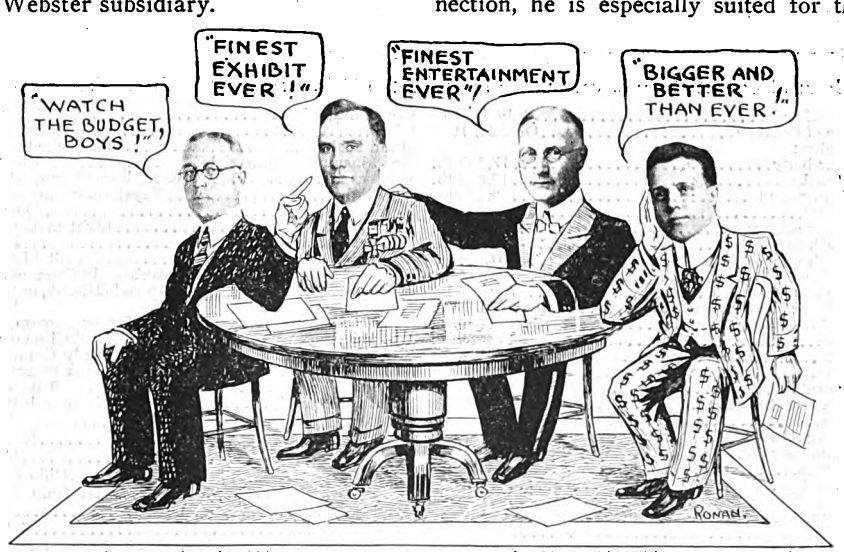
The Delaware Electric Power Company, Wilmington, Del., has ordered five quadruple equipments of Westinghouse 510 motors and double-end K-35 control for new cars as announced in ELECTRIC RAILWAY JOURNAL for July 14. The motors are equipped with oil-sealed housings.

Eight quadruple equipments of type 567-C-9, 150 hp., motors and HLF control have been ordered by Osaka Denki Kido KK of Japan for multiple-unit motor cars.

Redrow Appointed on Patent Board of Appeals

Walter L. Redrow has been designated by the President to be examiner-in-chief and member of the Patent Office Board of Appeals. He succeeds the late Sidney F. Smith. While serving as an examiner in the Patent Office, Mr. Redrow has had experience in those classes of invention involving metallurgy, electro-chemistry and other particular chemical subjects such as paper, rubber, glass and the ceramic arts.

Because of his experience in that connection, he is especially suited for the



Chairmen of exhibit and entertainment committees get busy with final plans

Board of Appeals, which receives the most vigorously contested cases, which, in turn, usually become the most involved as to differences of opinion and close distinction in points of fact.

Campbell Joins Paving Brick Association

Quincy A. Campbell has been appointed acting secretary and assistant to the managing director of the National Paving Brick Manufacturers Association.

In 1921, Mr. Campbell entered the Ohio Department of Highways as an assistant engineer, being later appointed assistant division engineer at Ravenna, Ohio. In 1927 he was promoted to the position of assistant chief engineer of maintenance, which position he has resigned to enter upon his present duties.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

Metals—New York	July 24, 1928
Copper electrolytic, cents per lb	14.527
Copper wire, cents per lb	16.625

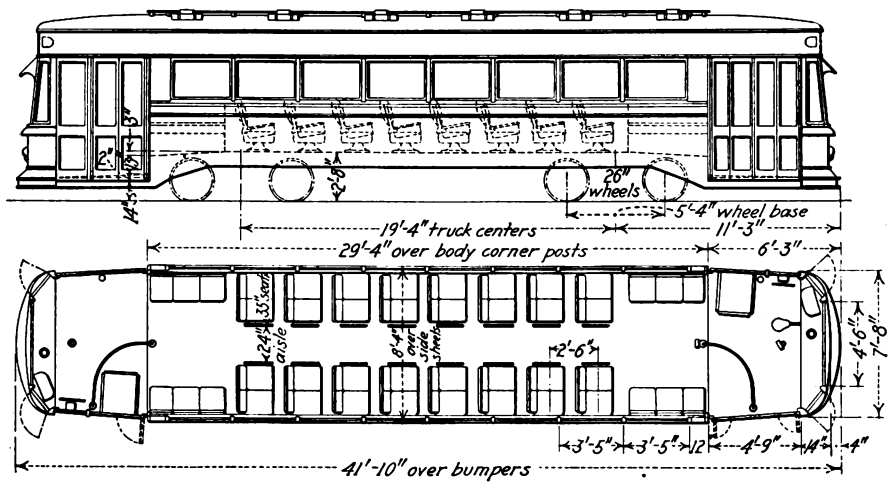
Specifications on Ten Cars for Delaware Electric

Delaware Electric Power Company, Wilmington, Del., has ordered ten one-man, two-man, city, passenger cars from the J. G. Brill Company. Announcement of the request for bids was mentioned in the June 16 issue of the JOURNAL.

The cars are of the double-end, double-truck type and seat 44 passengers. They are 41 ft. 10 in. long, 8 ft. 4 in. wide and weigh 36,640 lb. The bodies are of semi-steel construction with arch roofs and folding end doors.

The exterior finish is in orange, cream and red enamel with the interior in light mahogany. Two mirrors will be mounted in the vestibule above the operator's position, giving him a view of the car interior. Two pedal-operated and two air-operated sand boxes will be installed in each car. Further details are given in the accompanying specifications.



Plan of one of the new cars being built for the Delaware Electric Power Company

Date of order	July 1, 1928
Date of delivery	Oct. 20, 1928
Weights:	
Car body	17,300 lb.
Trucks	10,000 lb.
Equipment	9,340 lb.
Total	36,640 lb.
Bolster centers	19 ft. 4 in.
Length over all	41 ft. 10 in.
Length over body posts	29 ft. 4 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	10 ft.
Window post spacing	41 in.
Body	Semi-steel
Roof	Arch
Doors	End, folding
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Brill
Car signal system	Faraday high voltage
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	K-35
Destination signs	Hunter
Door mechanism	National Pneumatic Company
Finish	Enamel
Floor covering	Flexolith
Gears and pinions	Noiseless
Glass	Non-shatterable
Hand brakes	Peacock staffless
Heat insulating material	Celotex
Heaters	Consolidated truss plank
Headlights	Keystone incandescent
Headlining	Agasote
Interior trim	Light mahogany
Journal bearings	Plain
Journal boxes	Brill M.C.B.
Lamp fixtures	Ivanhoe indirect dome
Motors	Four Westinghouse 510 and GE-265, outside hung
Painting scheme	Orange, cream, red
Roof material	Haskelite veneer
Sash fixtures	Curtain Supply Company
Seats	Brill, biscuit back reversible
Seat spacing	2 ft. 6 in.
Seating material	Genuine leather
Slack adjusters	Brill
Step tread	Norton
Trolley catchers	Earll
Trolley base	Ohio Brass
Trolley wheels	Feist Ohio Brass
Trucks	Brill
Ventilators	Brill
Wheels, type	Steel, 26 in. diameter

$300,000 Order in Toledo

Twenty-seven buses costing $300,000 have been purchased by the Community Traction Company, Toledo, Ohio, and others will be bought on the basis of their performance in the motorization of several lines. The Yellow Coach division of General Motors obtained a contract for twelve; White Motors Corporation, six; Twin Coach Corporation, six, and International Truck Company, three.

ROLLING STOCK

PLYMOUTH & BROCKTON STREET RAILWAY, Plymouth, Mass., has received five Mack four-cylinder, 29-passenger, city type buses.

TENNESSEE ELECTRIC POWER COMPANY, Chattanooga, Tenn., has received three urban type Twin Coach buses.

BOSTON ELEVATED RAILWAY, Boston, Mass., received ten 28-ft. Gas-Electric drive urban type Twin Coaches.

TORONTO TRANSPORTATION COMMISSION, Toronto, Canada, has ordered ten Mack six-cylinder, 232-in. wheelbase, bus chassis. The Bender Body Company will furnish the bodies.

TRADE NOTES

HEYWOOD WAKEFIELD COMPANY, Boston, Mass., has appointed George E. Cornwall, supervisor of its railway sales division.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has elected as honorary vice-president, J. R. Lovejoy, vice- president, who has served the company 42 years; George F. Morrison, vice-president associated with the company 45 years, and B. G. Tremaine, one of the organizers of the national lamp division. All three will continue to function as directors and will retain their association with the several departments of the company's activities with which they have been so closely identified. T. W. Frech, manager of the incandescent lamp department, has been elected vice-president in charge of the incandescent lamp department, and Dr. W. R. Whitney, director of the research laboratory, has been elected a vice-president of the company and director of research.

ADVERTISING LITERATURE

LINDE AIR PRODUCTS COMPANY, New York, N. Y., has issued a booklet, "Oxwelded Industrial Piping." It describes and explains with illustrations, economies in construction, repair and maintenance of oxwelded pipe systems.

PAGE STEEL & WIRE COMPANY, Bridgeport, Conn., has issued a new booklet covering the Page preformed strand. Copies of the booklet will be mailed on request.

The Future Is What We Make It

"WHAT does the future hold for the interurban and city lines in the Middle West?" asked Charles W. Chase, president Gary Railways, Gary, Ind., in his paper presented before the recent Cedar Point meeting of the Central Electric Railway Association. The author answers this question not only for the Middle West, where he is specific, but for the industry in general, and proceeds to show that the result usually depends on the manner in which the respective managements handle the problems on their particular properties.

Mr. Chase reiterates the need for operating economies obtained through modernization of rolling stock and track, installation of automatic substations and of modern labor saving devices in shops and carhouses. He goes a step farther in suggesting a study with the view of cutting out duplication of effort and lost motion in the accounting department. He hints at the possibility of a subsidy in assisting in the construction of new routes. He launches boldly forth into a field too often overlooked in rehabilitation programs, namely, a financial house cleaning as a primary move in re-establishing credit.

That measures adopted must be thorough-going and not half-hearted Mr. Chase makes quite clear. Automatic substations and mercury arc rectifiers will he'p but little if rolling stock is obsolete; modernization of rolling stock will do little good if the financial structure remains top heavy; no property can pronounce its work completed if the financial structure has been balanced, but the all-important element of public relations has been neglected. Above everything, the management must believe in its own business and must be determined to win success.

Specific instances are cited where impoverished properties have been brought back onto the path of success by simple remedies repeatedly recommended to the industry but all too seldom adopted. Here a company has replaced obsolete rolling stock by modern one-man cars with a resulting saving of 26 per cent in car-mile cost. There a property, following a complete reorganization of physical, operating and financial structure, has been able to increase its passenger revenue more than 150 per cent over a period of two years. Still another organization which struck boldly out from conventional practice and reduced fares to certain special classes of riders has had its efforts crowned with success.

In dealing with the cases of properties in desperate physical and financial condition where instead of performance resort has been had to complaining against an unkind fate, too much time has been devoted in certain quarters to wishing that the heavens would bring down disaster upon the bus. Too many years have been spent in anticipating the time when the "saturation point" in automobile production would arrive. Too much dependence has been placed on the theory that economic conditions some day will force the working man to give up his automobile and come back to the street car. Speculation and theorizing never will accomplish the same results as concrete performance. What the future is to be in the way of transportation no man can say, but there is no doubt the electric railway will play an important part in it. There are before us too many examples of what forward thinking and aggressive action can accomplish in winning a place for the industry to warrant any other conclusion. Truly has Mr. Chase expressed the thought that the future of the local transportation industry is what we make it.

Fageol "Makes" the Headlines

VENTURING a prediction regarding the future of bus and rail transportation, Frank Fageol, president of the Twin Coach Corporation, speaking before the recent meeting of the Bus Division of the American Automobile Association proves himself to have a keen publicity sense even though his clairvoyant powers may be open to question. Not only does he evidence publicity genius, but he balances it skillfully with conservatism, tact and diplomacy.

Keen perception of the news value of his remarks is shown by the fact that our friends of *Automotive Industries*, and even our own contemporary, *Bus Transportation*, blazoned his name across their pages and print for their readers his address in detail. It should not be overlooked, likewise, that at this writing he has "made" the editorial page of ELECTRIC RAILWAY JOURNAL—and we will be pardoned for suggesting that that is no mean accomplishment.

In fact, Mr. Fageol has more than "made" the headlines. In *Automotive Industries* for July 21 the headlines attribute to him far more than he said or than the accompanying article bears out. One cannot avoid the inference that our automotive friends seem over-eager to relegate the street car to its doom. "Fageol Thinks Buses Will Replace Street Cars in 20 Years," announces the headline. But in the article Mr. Fageol actually says:

> I am firmly convinced that fixed urban and suburban transportation will ultimately disappear from our streets; however, I believe it will take 20 years to make any appreciable change and the aim and effort of all people truly interested in the economics of the situation should be to work in harmony and develop ways and means for gradual substitution of motor buses for rail cars to the end that the great public investment in rail systems shall be conserved and, in so far as possible, returned to the investors.

The cautious postponement of any material disappearance of rail transportation on city streets for twenty years is quite conservative. It is too bad that Mr. Fageol did not at the same time tell the transportation industry just how it shall be able to distinguish between a bus and a street car at the end of that period. Even at last year's convention in Cleveland, many who gazed at the exhibits were a little confused in determining which was the bus and which the street car section. Since then Mr. Fageol has been one of those responsible for resurrecting interest in the trackless trolley. We are likewise led to understand that he is busily engaged in producing a metamorphosis in the street car itself.

Digitized by Google

Today we have "electric rail coaches," "trackless trolleys," "gas-electric coaches," "gas rail cars," "gas-electric rail cars," "twin coaches," "trolley buses," and just plain "buses" of both the gas and gas-electric variety. What may we expect in twenty years? Then who can distinguish between what is meant by a "street car" and what by a "bus"? Even if Mr. Fageol had made the prediction attributed to him by the automotive headlines, he would be perfectly safe, because if we all live until 1948 it would be possible to get on either side of the fence and claim that any one of the many varieties of public vehicles that may then be operated on the streets of cities was what was meant by a "bus" twenty years ago. The futility and ridiculousness of persistent revival of the car-bus replacement controversy seems quite obvious. But we maintain that Mr. Fageol proves himself both an able publicist and a skillful diplomat.

Equipment Men's Meeting a Real Symposium

FOLLOWING the presentation of ten papers on subjects which covered almost every phase of electric railway equipment maintenance, the Electric Railway Association of Equipment Men, Southern Properties, in its Cincinnati meeting, devoted a full day to the discussion of maintenance methods and problems.

Instead of orating on theories and generalities, the delegates lost no time in getting down to brass tacks with a list of some 51 questions pertaining to electric railway service and operation. The quiz to which these mechanical men subjected themselves greatly resembled an examination such as might be held in a university graduating class, except that there were about six times as many questions and each question was of an extremely practical nature.

While the majority of the questions related to mechanical details of electric railway upkeep, yet many of them were of general interest, inasmuch as they concerned what was being done toward providing more comfortable street cars, better looking cars, faster cars, and more frequent service. Of special interest was the way in which opportunity was given the manufacturers' representatives to answer directly questions involving the performance characteristics of their equipment. As a matter of suggestion, it would appear that no little emphasis might well be placed on such fact finding discussion as these men could contribute to in earnest.

An exchange of experiences on the maintenance and operation of the various types of street car equipment proved both instructive and extremely helpful to the different properties. The way in which differences of opinion received scant consideration unless promptly substantiated by a recitation of figures and facts was evidence of the sincerity of purpose behind the discussion. It is little wonder that this association has acquired an outstanding reputation for attention to business.

Why the Enthusiasm?

SAFETY gatherings, as a general rule, are not the liveliest kind of meeting that can be held. Most of them are "dry" affairs, with speeches on "don't do this," "don't do that," "always be careful," etc. The audiences rarely applaud the speakers voluntarily and many of the meetings prove beneficial to the weary-worn, those in need of sleep. In short, they are woefully lacking in the necessary elements to make them interesting.

An analysis of a safety rally, held recently for the employees of a large property and their families, reveals the "why and wherefor" of the deep interest and genuine enthusiasm which characterized the whole rally. In the first place the meeting had been well advertised. Knowing the date, the employees planned days ahead to attend and informed members of their families and friends, so that on the big night the huge auditorium in which it was held was filled almost to capacity.

In the second place, the entertainment committee outlined a program well worth advertising. "Home talent" vaudeville acts were supplemented by a complete musical comedy of exceptionally high order, staged by a professional group of juvenile singers and dancers. Thirdly, a human touch was added to the program by presenting to the audience the committee members who planned the rally.

The discussion of safety occupied such a small proportion of the evening that one might ask, "Why call it a safety rally?" In the brevity of the reference to safety lies the secret of the effectiveness of the whole plan. Two very brief safety talks were made, one by the company's general manager, the other by his assistant. Each speaker presented with a comparatively few words a definite message that everyone present listened to and heeded. The fact that two officials delivered the talks and otherwise took an active part in the meeting added much to the effectiveness. Other officials might have stopped at authorizing the meeting, but these two officials not only attended but also imparted much of their enthusiasm to the committee members and all who attended the rally.

Indiana Interurban Should Benefit by New Affiliation

AUGUST is expected to see the final steps taken in connection with the merger which will mean a new alignment for the properties of the Terre Haute, Indianapolis & Eastern Traction Company. The plan is an auspicious one, since it will undoubtedly mean the opportunity for the intensive development of the company along lines not possible under past sponsorship. This is in no way a reflection on the property as it has been conducted. Certainly the interurban has been hard hit, and only by the adoption of heroic measures has the local system in Terre Haute, in the heart of the soft coal fields, been able to keep its head above water.

The agreement now ready to close has been pending a long while. In advancing it to the present stage there has been a great deal of give and take. Guarantees at first thought to be imperative have been waived on the part of the owners in the interest of the probable future good to be derived from the proposed association of the Terre Haute, Indianapolis & Eastern Company with the Central Indiana Electric Company as the Indiana Electric Corporation. Some of the present holders will go in on a basis that promises little or no immediate return to them, but one that does hold out promise for the future much less remote than the continuation of operation as conducted independently at present.

The terms of the exchange of securities have been given in the JOURNAL in detail sufficiently complete to let anyone judge for himself who is interested enough to delve into the intimate facts. It would seem that in the merger the appellation designating that some of the properties are railways will go. But there again the concession appears to be in the interest of the greatest number. No one, least of all the owners, will find fault

Digitized by Google

if the new association fits the road to meet more effectively the intensive competition of the private automobile, the bus and the motor truck and in so doing restores to it the degree of prestige it ought rightfully to enjoy.

The Quality of Courtesy is Not Strained

NO LESS a setting than the famous phrase from Shakespeare seems appropriate for expressing the quality of courtesy in human relations—and in transportation salesmanship, which is after all primarily a problem of human relations—after hearing R. N. Graham's address before the Central Electric Railway Association or reading his views in the article published elsewhere in this issue. According to Mr. Graham the quality of courtesy must be ever present in a platform man, regardless of any other qualifications which he may have as an efficient operator and representative of the company. "When we think of a conductor that has our full approval as an employee, we think of him as being neat and courteous, friendly and courteous, business-like and courteous," says Mr. Graham.

But the idea is developed further. In considering the importance of courtesy in platform employee salesmanship, two other intensely practical factors must be considered. It is all well enough to discuss abstractly the importance of courtesy in the contacts between platform employee and rider. But the practical problem is that of determining just how the men on a given property are to acquire this much-to-be-desired quality. This Mr. Graham does not neglect to do. He points out how to introduce courtesy on a property and how to disseminate it to the men in the ranks.

First of all, the management itself must have acquired the quality which it demands in the men on the platforms. To go on taking liberties with Shakespeare, courtesy, like mercy, "droppeth as the gentle dew from heaven." But the wrong point of view at the manager's desk will effectively blanket an entire organization from the absorption of this God-given quality in human relations. Courtesy cannot be hired or preached. It must be practiced. It originates at the top of an organization and not in the ranks. It travels down, not up. Obviously, also, to travel at all through an organization, there must be the kind of contact between management and employees, that will give the men the opportunity of catching the spirit of their leader.

Attacking the Parking Problem a New Way

OPERATION of automobile parking areas by electric railway companies is not a new idea, but the latest development of this kind at Philadelphia is rather different from what has been done heretofore. About two years ago several large parking fields were established in the outskirts of the city by the Philadelphia Rapid Transit Company. Payment of the parking fee entitled the automobilist to free transportation to the downtown district on the company's cars. This plan accomplished two purposes. It kept these private vehicles away from the congested downtown streets and encouraged the use of public transportation vehicles.

Recently, however, a new parking area has been established by the P.R.T. in the very heart of the city, as told in an article appearing elsewhere in this issue. At first thought this procedure might seem to encourage the use of private automobiles in the congested district to the detriment of the public transportation system. More careful consideration, however, discloses another side of the picture. The company recognizes that the private automobile has a legitimate place in the general transportation scheme, and that for one reason or another, a certain number of people must and will continue to use their own automobiles in the downtown section of the city. It is highly desirable, however, that these automobiles should be kept off the congested streets except when they are in actual use. Roadway space in the center of the city is no more than adequate for moving traffic, and its use for storage purposes inevitably produces congestion. The railway management has insistently urged that no parking be allowed on the narrow downtown streets. Obviously, then, some other parking place must be provided for the people who insist on using private automobiles. By providing convenient parking space at reasonable rates, the company feels it is encouraging the automobilists to store their vehicles off the streets, while the only profit which it expects to derive is from the relief afforded from traffic congestion.

The plan is admittedly an experiment. Some time will be required before the measure of its success can be determined. All transportation men, however, will watch its progress with considerable interest.

Getting Down to Fundamentals

SIGNIFICANT of the new thought that is taking hold of the electric railway industry is the change in character of the topics selected for the annual conventions of the American Electric Railway Association. While in the past the delegates often have been addressed in general terms by speakers who knew little about the problems of transportation, the programs now are replete with talks in concrete terms by leaders who know their subjects and are not afraid to speak straight from the shoulder.

This year the general subject treats of fundamentals that are of outstanding importance. Improvements in the electric railway's product—transportation—have been so numerous that there is much to be said that is of interest to all operators. In the sessions of the American Association, in the sessions of the affiliated associations and at the luncheons this theme will be expanded. In the exhibits will be concrete evidence of improvements that will drive home the lesson so that it cannot be missed.

In every department there has been definite progress, both physical and mental. The leaders are thinking in terms unheard of a few years ago. Methods have been developed, and mechanisms have been perfected, for doing what was thought to be the impossible. Cars have undergone a complete metamorphosis, and it is expected that new types will be on exhibit that will out-distance anything previously developed. The bus, the newest entry into the transportation field, has itself undergone a development so complete and so rapid that it is difficult to keep pace with it. Track and line have likewise undergone improvements that have changed the entire outlook of the engineers. Transportation department methods have changed no less radically. Safety has been obtained without sacrifice of speed or other desirable characteristics. Accounting methods, too, are undergoing great improvement. In short, there is no one connected with a transportation property who has not been under the influence of these developments.

Out of this background comes the convention. As few conventions have in the past, it puts in concrete form the new thinking that has been going on. A program such as that in preparation has something for everyone, and everyone can add something to the program.

Transportation Improvements

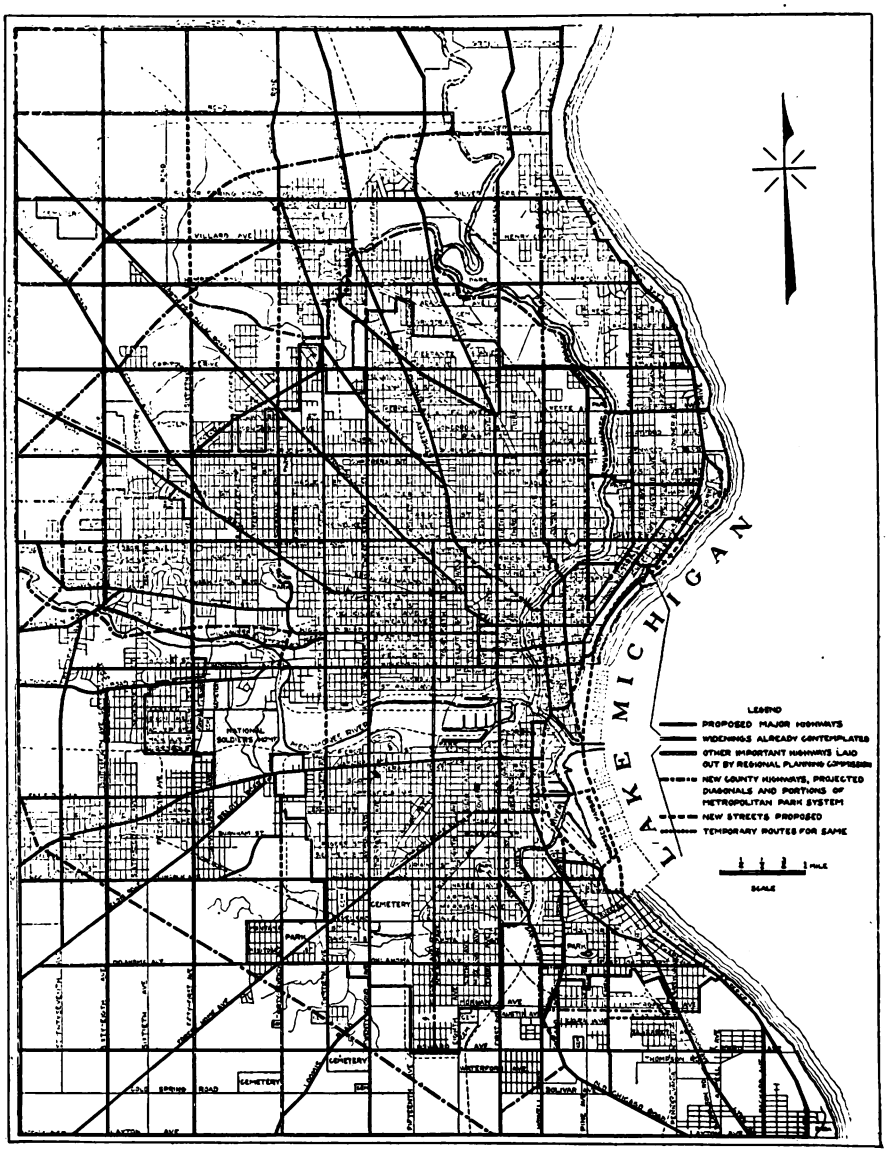
Recommended for Milwaukee

McClellan & Junkersfeld, Inc., emphasized need for early action by the city to reduce street congestion. Basis of mass transportation declared to be street railway and rapid transit, supplemented by bus

FIRST ARTICLE

IN THIS, the first of two articles abstracting the Milwaukee Transportation Survey, are the recommendations made for the improvement of transportation and the measures advocated for the relief of congestion. The second article, to be published next week, will contain an outline of transportation conditions found in Milwaukee, including an analysis of travel routes and other factors affecting the performance of street railway and bus lines.—EDITOR.

COMPREHENSIVE plans for the immediate relief of congestion and for the improvement and expansion of transportation and highway facilities to keep pace with the future, as well as the present needs of the city, are contained in the transportation survey of the Milwaukee metropolitan district recently completed by McClellan & Junkersfeld, Inc., for the transportation survey committee of Milwaukee, an appointive body composed of four groups representing the city administration, the public, the Railroad Commission of Wisconsin and the Milwaukee Electric Railway & Light Company. The work was directed by Thomas R. Tate, who also had charge of the Washington survey made by the same firm, a digest of which was published in the Oct. 31, Nov. 7 and Nov. 14, 1925, issues of ELECTRIC RAILWAY JOURNAL.



Major highway plan proposed for Milwaukee by McClellan & Junkersfeld, Inc., to speed up movement of traffic and reduce congestion

Milwaukee, like most other cities of the country, has for some time been suffering from congestion of its streets and highways, with resultant slowing down of all forms of transportation, and consequent economic loss to the community and restriction of its development. The increase in congestion that has taken place to some extent on all main traffic arteries during the past few years, and principally those in the central business district, made it apparent that a comprehensive survey was necessary to determine the pertinent facts upon which to base plans for relief. The most important effect of congestion increase was the lower average speed of travel. This is illustrated by street car speeds, data on which were available over a

Digitized by Google

Faster service for street car riders is provided by a system of semi-rapid transit surface lines with limited stops

period of years. Comparable speed reduction for other classes of traffic had taken place even with increasing expenditures for traffic regulation. Street car speeds for several years beginning in 1922 were as follows:

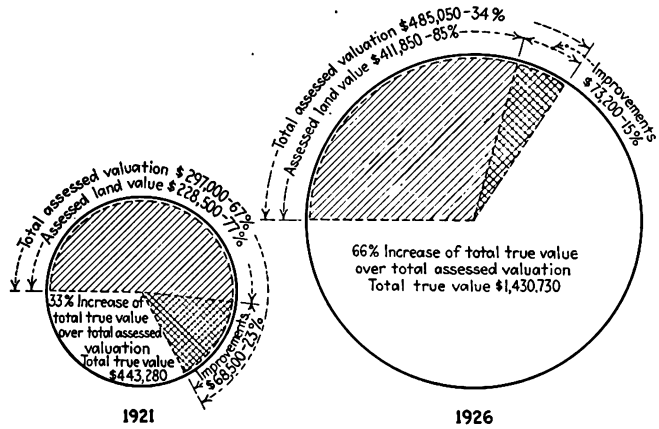
Year	Miles Per Hour
1922	9.83
1923	9.69
1924	9.68
1925	9.62
1926	9.48

The survey outlines plans looking forward to the needs of a population of 1,000,000 people by 1950. It recommends a gradual program of improvement intended to provide for the rapid and efficient movement of public and private transportation vehicles with minimum expenditures for street widening and other major construction projects. The principal recommendations include the following: A system of major traffic routes, arterial highways and trucking routes, requiring the widening of certain streets and the construction of new bridges and viaducts; parking restrictions varying with the traffic on the several streets and districts; regulation of river bridge opening hours to avoid interruptions of rush-hour traffic; improvements in the control of traffic signals and elimination of street jogs, bottle-necks, dead-ends, and other physical causes of congestion; further development of the rapid transit system, a part of which already has been built, to serve the growing needs of suburban areas; a semi-rapid transit plan to permit faster movement of street cars pending the construction of additional high-speed lines; rerouting of street car and bus lines, new lines and extensions, loading zones, queue loading, prepayment of fares, improvements in methods of fare collection, modification of the Wisconsin Railroad Commission's service standards, and staggered working hours to reduce peak loads.

Principles of Relief Established

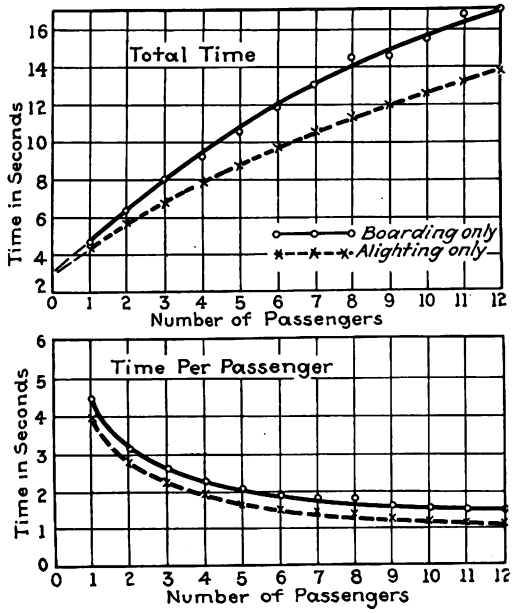
Certain general principles of routing and control are set up as the basis for the development of a traffic plan suited to meet the condition of rapidly growing traffic volume. These are, briefly: Segregation of slow-moving, fast-moving, local and through traffic, trucking, mass transportation facilities, etc.; effective utilization of those key streets, especially certain radial and diagonal highways, which by their location and topography, their connections and districts served, form natural traffic arteries; reduction of vehicle density in congested streets by providing alternate routes in certain areas; increasing the effective area of existing streets; increasing the effective use of existing streets.

In the major highway plan shown on the accompanying map arterial highways are intended for high-speed traffic only. It is proposed to prohibit all but light and high-speed trucks from using these highways after a system of trucking routes is fully developed. Streets having car lines were not designated as arterials

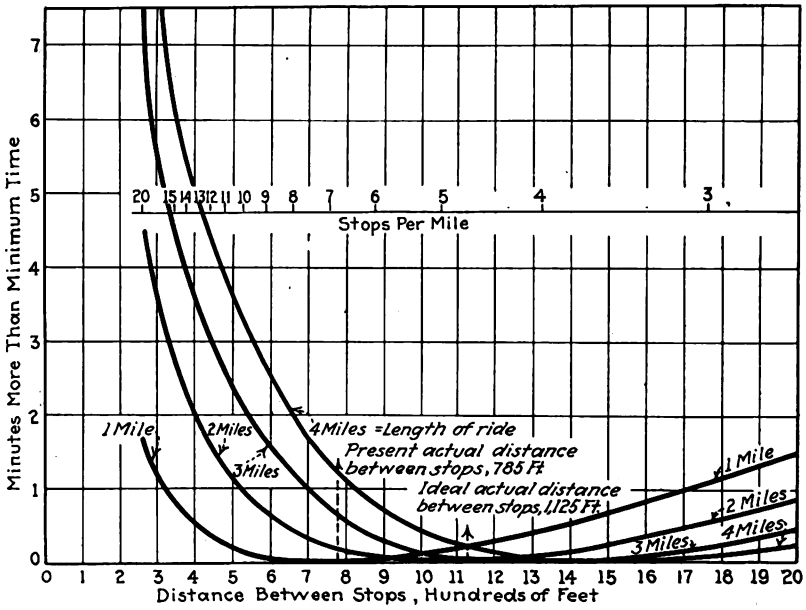


The effect of improved transit facilities on land values is illustrated by the increase in value from 1921 to 1926 of property adjoining the new Wauwatosa rapid transit line which was built by the Milwaukee Electric Railway & Light Company entirely with its own funds

Digitized by Google



Time of stop per passenger boarding or alighting decreases with increase in the number of passengers interchanged



The effect of the distance between stops on the time required to travel various distances shows in a striking way the advantage to the passenger of decreasing the number of scheduled stops

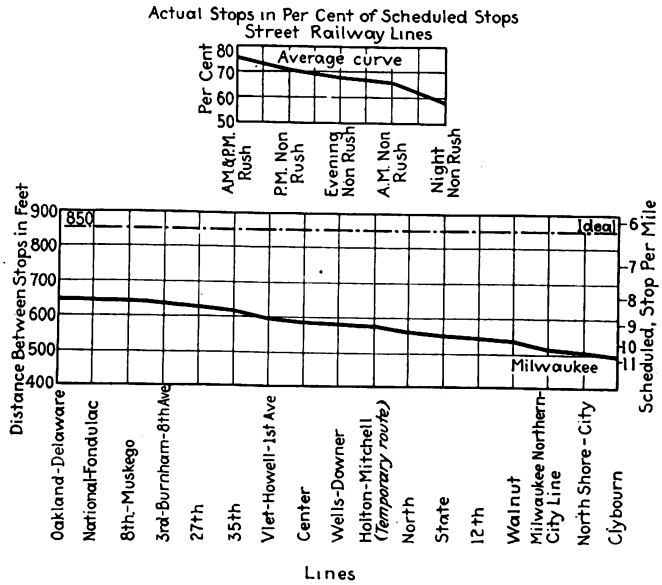
unless they were main diagonal routes or important cross-town arteries. The number of arterial highways was kept at a minimum in order to avoid unnecessary delays to crossing traffic. A thoroughly co-ordinated, progressive traffic control system is recommended for the arterial highways. Trucking routes are laid out to keep slow trucks off the arterial highways and street car streets, but are intended to provide a comprehensive system of direct routes to serve industrial plants, railroad and dock terminals, commission houses and warehouses. The street-widening suggestions contemplate completion within five to ten years of those improvements now urgently required or considered necessary within that time. The program includes only those street-widening projects considered essential and proposes for the most part the widening of roadways by setting back the curbs. Construction of certain new bridges and viaducts also is recommended.

Parking restrictions were drawn to reduce congestion on main arteries and in heavily traveled districts, especially during rush hours, while at the same time giving consideration to the needs for loading and unloading passengers and goods as indicated by traffic and parking checks, both in the central business district and in outlying sections. Specifically, it is recommended that parking be prohibited from 7 a.m. to 11 p.m. in the central business district on Wisconsin Avenue, the principal business street, and on certain other streets in the central business district during the rush hours only, from 7 a.m. to 9 p.m. and from 4 p.m. to 6 p.m. Parking prohibition all day is recommended on certain other principal arteries outside of the business district and on still others during the rush hours, from 7 a.m. to 8:30 a.m. and from 4:30 p.m. to 6 p.m.

Causes of Traffic Delay Cited

Milwaukee has a city ordinance, passed many years ago, which prohibits the opening of any of the movable river bridges between 6:15 and 7 a.m. Proper bridge closing hours were determined from traffic checks made on the principal bridges. The report recommends that all bridges be closed for 1½ hours during both the morning and evening rush, the period for the evening being 4:30 to 6 p.m. for all bridges, but the morning period varying for different locations. Because of the street layout and the presence of double-track car lines on most of the streets in the central business district, one-way streets are not recommended. The shifting of traffic lanes morning and evening on two important thoroughfares leading to the central business district is suggested.

A system of progressively controlled traffic lights is recommended for Wisconsin Avenue through the most congested part of the downtown district. Many of the intersections now controlled by traffic lights were found not to have sufficient crossing traffic to justify them. Prohibition of left turns is recommended only at inter-

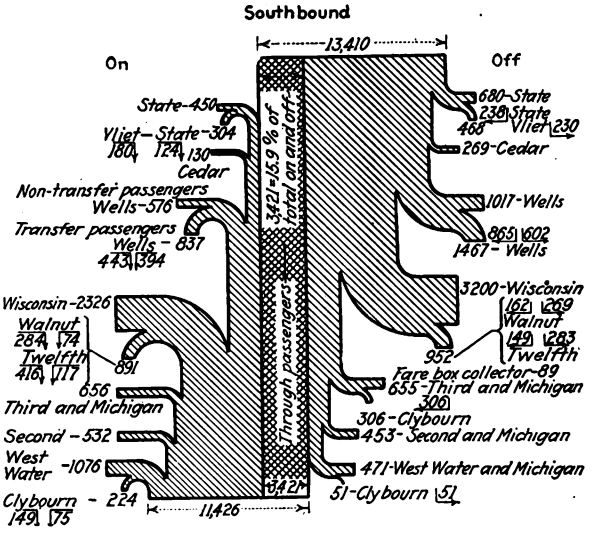


Scheduled stops per mile and distance between stops are shown for all city lines. This chart also shows the relation between actual stops and scheduled stops for various periods of the day

Digitized by Google

sections where the number of such turns during the rush hour causes congestion.

The Milwaukee Electric Railway & Light Company has launched an extensive program of rapid transit construction and has practically completed two projects. This program, which was discussed at length in an article published in the Feb. 25, 1928, and March 3, 1928, isues of this paper, contemplates serving outlying areas by rapid transit lines operating on private right-of-way, using in some instances the right-of-way of the company's interurban electric railways. It is proposed to bring the rapid transit lines into the basement of the Public Service Building through subways in the most congested portion of the city. The report points out that the Chicago, North Shore & Milwaukee Electric Railroad affords a route for a rapid transit trunk line and that the Chicago-Milwaukee service of this railroad could be brought into the city through subways built for rapid transit purposes. Attention is drawn to the possibility of rapid transit service for the residential areas adjacent to the lake front on the north of Milwaukee by using a Chicago & Northwestern Railway route which is now being abandoned.



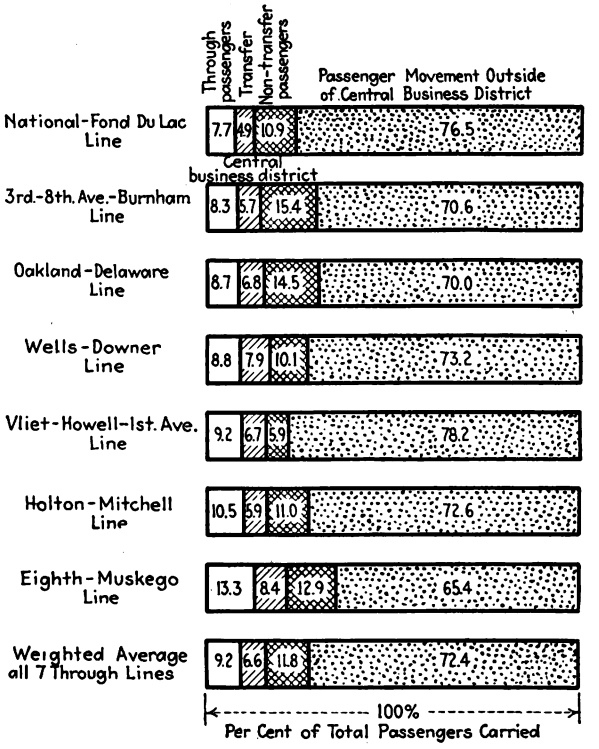
Another method of showing the relation between transfer and through passengers in the downtown section is illustrated by this chart for southbound movement on the Third Avenue-Burnham line on a typical week day

Semi-Rapid Transit Surface Lines Proposed

To provide faster service within the present city limits it is proposed to inaugurate a system of semi-rapid transit lines on the surface with limited stops. Six routes are proposed and are shown on the accompanying map. It is recommended that these streets be designated as "Transit Highways" and that all crossing traffic be required to come to a full stop. Passenger stops would be made about one-half mile apart at transfer points and other important intersections, with more frequent stops in the central business district. At the terminals of these lines it is proposed to erect suitable shelters for transferring under cover. This semi-rapid transit scheme makes possible the rerouting of several local street car and bus lines. It is proposed to use three-truck, articulated, two-car trains on the semi-rapid transit lines, and single-unit and one-man cars in outlying districts. Several through-routed street car lines would be looped in the central business district, most of them in the Public Service Building. In outlying districts most of the extensions consist of feeder bus lines connecting with the semi-rapid transit lines. East-and-west crosstown bus lines are proposed on Capitol Drive and Burleigh Street.

Among the suggestions made for improving the street railway service are: installation of safety zones throughout the central business district and at principal outlying transfer points; raised platforms with suitable protection for passengers; prepayment zones at heavy traffic interchange points; street fare collectors at heavy loading points during rush hours; "queue" loading at certain industrial plants and other heavy loading points; changes in equipment to reduce the time of opening and closing car doors; use of metal tokens in place of paper tickets to speed up loading, with the possibility of using automatic registering fare boxes; revision of transfer practices; new equipment.

It was found that the loading standards and specifications which the Railroad Commission of Wisconsin has developed fo rthe city of Milwaukee are more rigid than those adopted in most cities where legislation of this sort has been attempted an dthat in its effort to live up to the letter of these requirements the company has, at times, especially during the summer months when traffic is slack, been supplying considerably more service than conditions warranted. With this in view it was recommended that the company, co-operating with the Railroad Commission, be permitted more flexibility in the preparation and revision of its schedules so that sudden or seasonable changes in traffic could be anticipated and provided for as they arise. It was also pointed out that more economical and improved service would result if the sharp rush-hour peaks could be reduced by staggering working hours of large industries. This is a practice that has been successfully followed in other cities.



Extent of the transfer movement of passengers in the business district in relation to the non-transfer and through passengers and to the total passengers carried varies considerably between the several lines shown

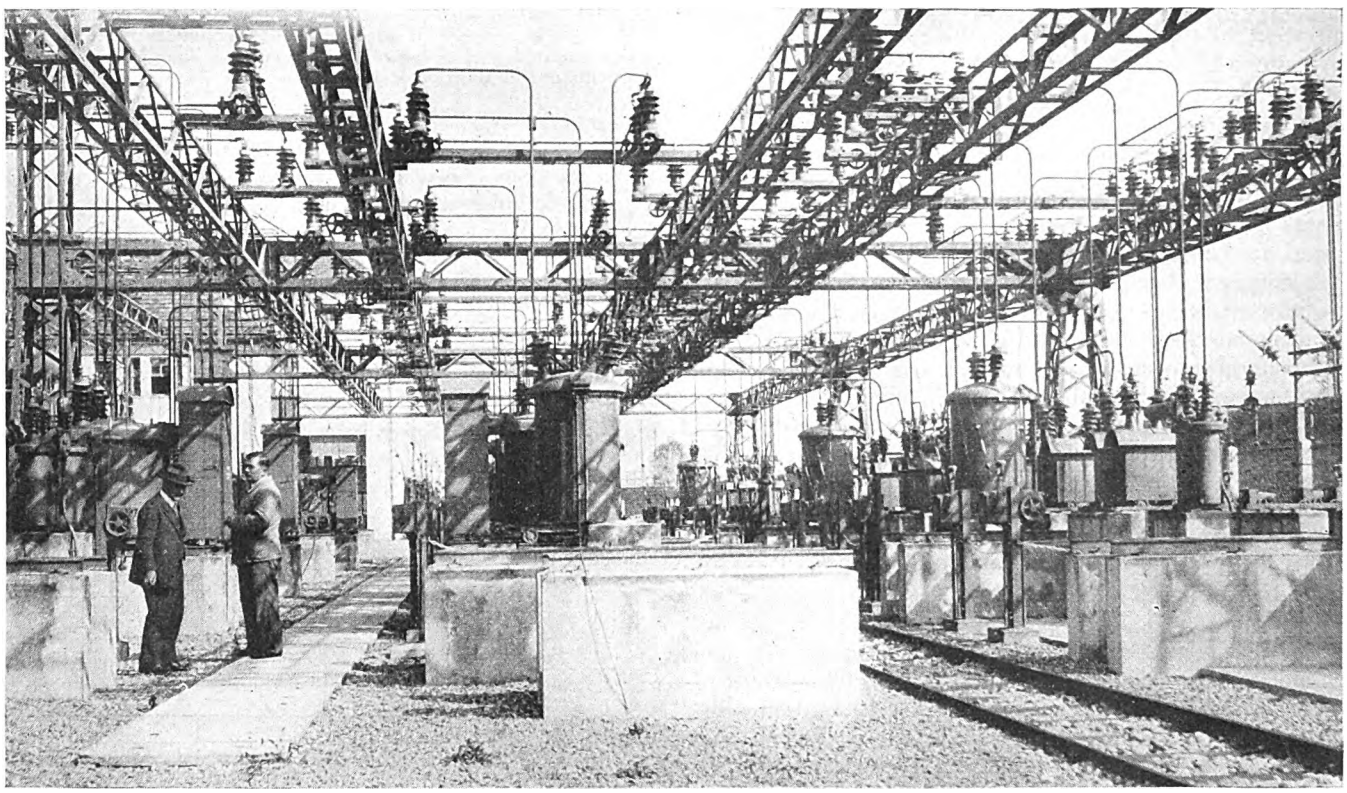
Water Power a Factor

in the Electrification of Swiss Railways

Purchase of foreign coal was obviated by electric operation of Swiss government railway system. Light forms of contact line construction used. Maintenance costs of locomotives are given

By Kent T. Healy
Research Associate, Yale University, New Haven, Conn.



Arrangement of one of the single-phase outdoor substations of the Swiss Federal Railway

FOLLOWING the war the Swiss Federal Railway system was at the mercy of foreign coal miners and companies, with the result that traffic was severely impeded and fuel expense mounted to unheard-of heights. With the supply of water power so plentiful in Switzerland the answer to the coal problem was electrification. Electrification began in 1919 and plans were made for conversion of all the main lines by 1933. In 1921 the program was accelerated to help the unemployment and slack industrial condition and 1928 was set as the year in which the construction was to be completed.

The electric power for the system comes in the main from the two water power groups, Ritom-Amsteg and Barbarine-Vernayaz. The first group is paired, the Amsteg plant on the north side of the mountains utilizing the melting snow and glacier ice in the summer, while the Ritom plant on the south side supplies the power in the winter. The other group consists of a river plant at Vernayaz and a storage plant at Barbarine, the latter two using the same water. The main plants of each group have some generators supplying commercial transmission lines. The energy production of this system in 1926 was as follows:

	Kw.-Hr.
Energy produced in railroad plants	285,000,000
Purchased energy	19,500,000
	304,500,000
Transferred to outside companies	59,200,000
Energy consumed in power plants	2,000,000
Energy for other non-traction uses	4,600,000
Transmission losses (estimated)	22,000,000
Substation consumption	1,700,000
Substation output	213,000,000

The maximum momentary power swings during this period were 4,200 kw. at the Massaboden plant, 48,500

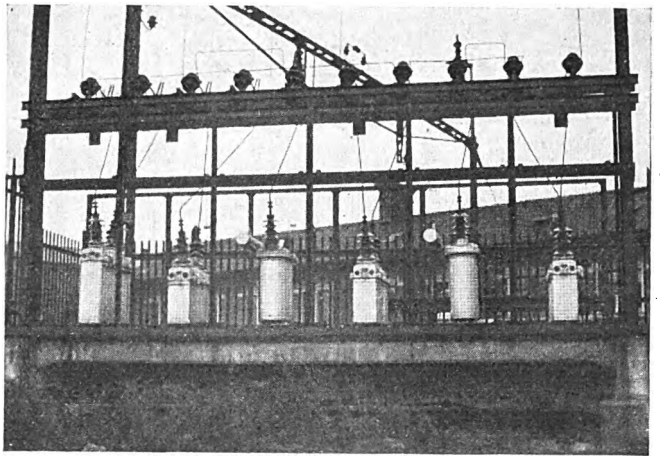
Digitized by Google

kw. for the Ritom-Amsteg plants and 19,500 for the Barbarine plant. The load factor on the basis of momentary swings for the Ritom-Amsteg group, the only one under full operation, was 41 per cent. The cost of energy per kilowatt-hour delivered from the substations was about 1.2 cents based on 5 per cent interest on the capital, 0.5 per cent for a sinking fund on all property, 1 per cent for a retirement fund on transmission lines, etc., and 3 per cent for a retirement fund for machinery. As the load increases and the full capacity of the plants is utilized the costs will naturally be less. The budget for 1928 contemplates a cost of 1.1 cent.

Energy Is Transmitted Over a 66,000-132,000-Volt System

The energy from the power plants is transmitted over a network of 66-kv. and 132-kv. trunk lines to various substations feeding the overhead distribution systems. The map shows the general arrangement of the whole system. The transmission lines are of the ordinary type in most places, although 175 miles of cable line on the 66-kv. circuits are in use in restricted sections such as narrow valleys, tunnels, and places where there is danger from landslides. The cost of construction of the usual two-circuit single-phase transmission line with steel poles ranges from $10,000 to $12,000 per mile.

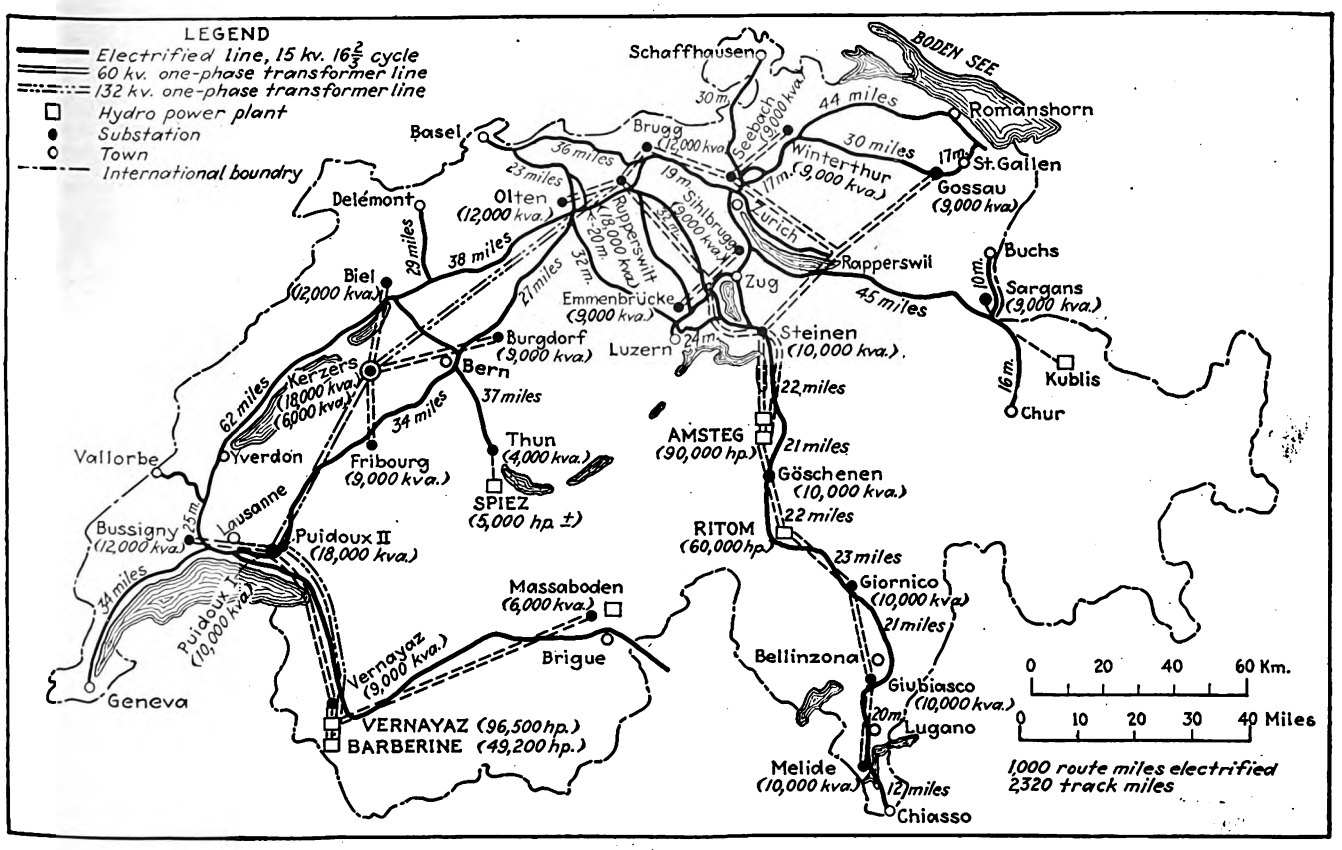
The substations are merely static transforming points with provisions for sectionalizing and switching on the transmission lines. They also form the control points for each group of overhead trolley distribution lines, the substation operators acting as load dispatchers or power directors for their respective groups. In the modern substations all power equipment is outdoors, with control apparatus, local service, and repair facilities for the largest piece of apparatus housed in an adjoining building. All equipment is mounted on wheels and tracks



Sectionalizing switch group at one of the small stations with oil disconnecting switch and potential transformers

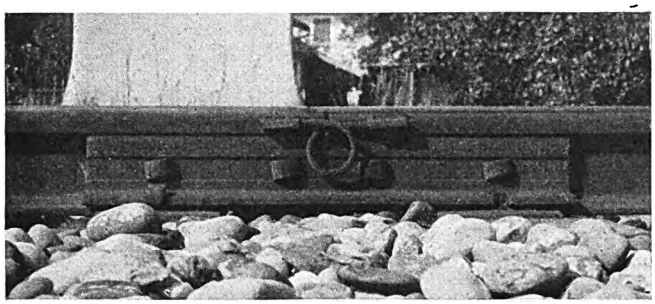
connecting with the repair room. Rigid buses are used throughout as a precaution against complicated tie-ups from bus failure. Standardized single-pillar insulators are used for distribution of 15-kv. circuits, and double insulators for transmission circuits with 30 kv. to ground. The arrangement is shown in one of the illustrations.

The distribution switching in the substations is coordinated with the general principles of sectionalizing on the whole track system. With a view to saving oil switch costs the rupturing of all short circuit or ground currents is confined to relatively few circuit breakers located in the substations. These are of the series opening contact type with resistance across the first three contacts to open. With a ground the main breaker in the substation instantly opens, and the line is energized again at normal voltage through a circuit with a limiting resistance to keep the current flow to 10 amp.



Lines of the Swiss Federal Railway electrified and projected

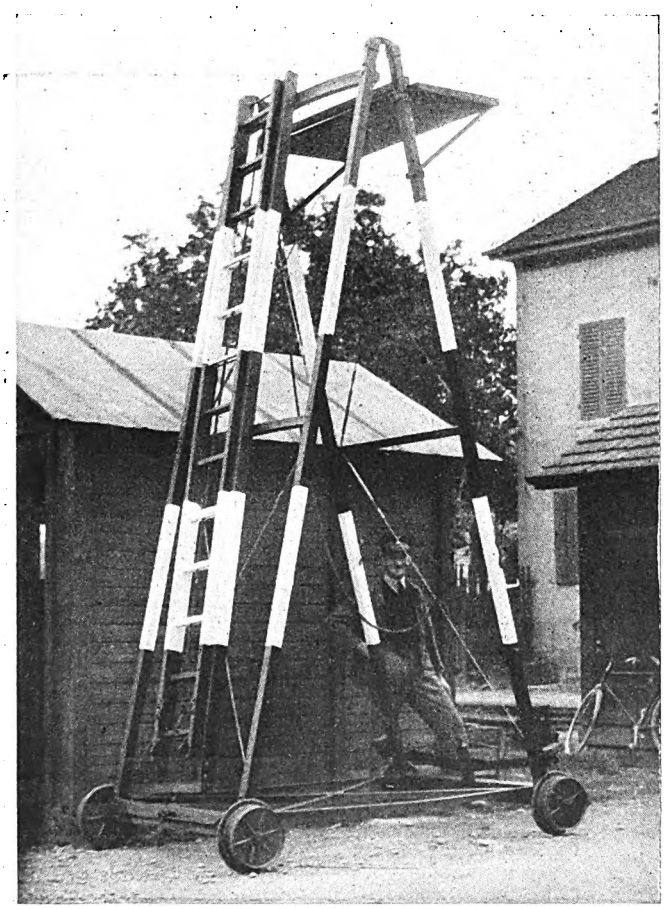
Digitized by Google



Electric welded bonds have a complete loop of the cable to give flexibility

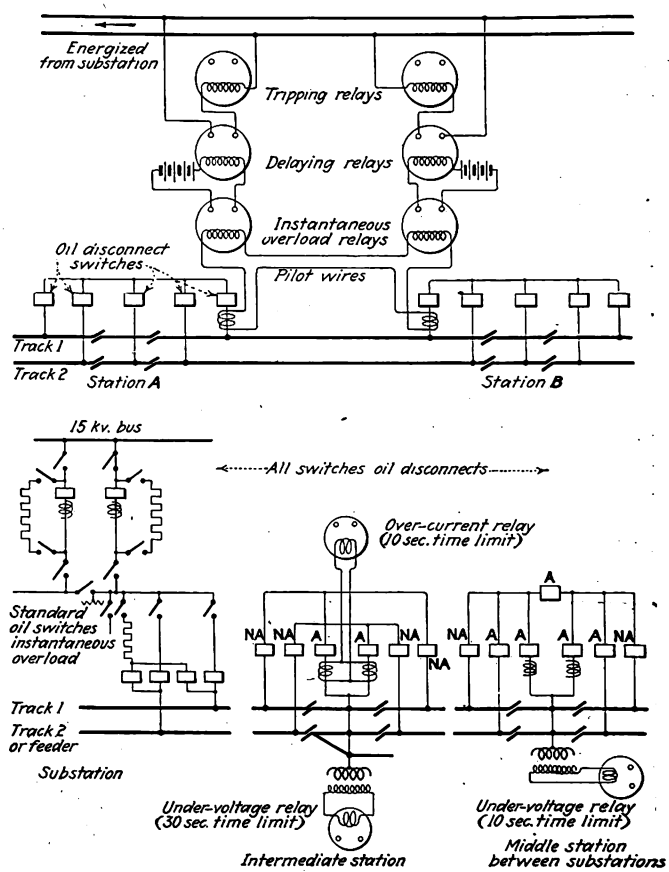
Local sectionalization of the track circuits is effected in different ways, though all types conform to the general principle of testing with limited current following the trouble. The advantages of this are twofold. Re-energizing the line with a small current prevents burning of the wires and further damage in other ways. Sectionalizing can be done with switches designed to handle only this small current, rather than large capacity switches, thus saving many thousands of dollars in equipment.

The most highly developed sectionalizing system is that in the heavy traffic two-track line through the St. Gothard tunnel to Italy. Here the tracks are sectionalized at each station, with all the yard tracks kept separate. At each end of main line section is a current transformer in the switch bushings, the two tied together through a cable circuit running from station to station parallel to the tracks. At each end this circuit is connected with current relays, indirectly actuating the oil disconnect switches to sectionalize the particular track. The current transformers are in opposition so that when there is an excessive current flow in another section the net result in this relay circuit is zero, but where there is a ground within the section and it is fed from both ends the currents in the relay circuits are added. The disconnect switches, however, do not open till the substation circuit breaker has opened and the testing current been limited to 10 amp. This system is shown in one of the illustrations.



Maintenance ladder equipment

With a view to reducing the cost of sectionalizing equipment a study was made of the location of failures over a period of years. Only 15 per cent of the failures were more than temporary, and most of these occurred in yards and stations. With this record automatic switching at each station along the line seemed unnecessary. The yard and station territory was fed separately



Simplified diagram of sectionalizing system used

A—Automatic—operated by relays. NA—Non-automatic.

through an oil disconnect switch actuated by an under-voltage relay with a time limit to permit the substation breakers to open the ground current. For two-track sections, the tracks were automatically separated by similar switches actuated by time limit current relays. The sections were also separated midway between substations by automatic disconnect switches opening on a short time limit to allow as much of the line to remain alive as possible in the testing process. Accompanying views show a typical switch group and the wiring diagram for such an arrangement.

Two Designs of Overhead Distribution System

The overhead construction follows two different designs. The first type is confined to a short span of about 200 ft. with no intermediate steady devices. Light H section rolled-steel poles are preferred, but fabricated poles are dictated to foster home industries. Light

Digitized by Google

cross beams support the catenary from pin insulators. The other type uses a normal 328-ft. span with an intermediate pole for steadying or pull off purposes. These are shown in illustrations. In both designs the contact wire tensions are kept constant at 1,320 lb. for a 0000 copper wire. The tension apparatus for this are spaced at 3,000-ft. intervals. The maximum tension in the $\frac{3}{8}$-in. steel messenger is calculated at —4 deg. F. to be 1,320 lb. in both designs, giving a factor of safety of six. The contact wire is tied to the messenger every 39 ft. with copper-clad hangers somewhat over $\frac{1}{8}$ in. diameter. To give freedom for movement of the contact relative to the messenger the minimum length of hanger is 30 in. Flexible joints in the hangers prevent hard spots on the contact wire.

The design of the catenary has been simplified after extended experience with an intermediate wire, only a messenger and contact now being used. In steam operating territory a copper-clad messenger is used to prevent early corrosion. Double insulation is also used, though its discontinuance has been advised for sections in which the train operation is purely electric. The pole spacing has been governed by the wind, normally being calculated on the basis of wind pressure of 15 lb. per square inch. Where exceptional winds are encountered the pole spacing is shortened.

Great effort has been made to give uniformly long life to all parts of the overhead system. Non-ferrous fittings are used throughout. Aluminum pantograph shoes with pressures of 7 to 9 lb. allow copper contact wires to be used without appreciable wear even on the heaviest traffic sections.

Overhead Maintenance Done at Night

Maintenance of the overhead system is normally performed between midnight and 4 or 5 a.m., so as to utilize the labor efficiently without traffic interruptions. Small collapsible ladders are towed by gas cars to the working place. Tower cars for heavy work are hauled by steam locomotives commandeered from the nearest enginehouse. Most of the troubles, such as insulator failures, hanger breakages, messenger and trolley breaks can be handled from the light ladder cars. The repair crews have main headquarters at the substations with some equipment and men at outlying points. Each foreman covers on an average 76 miles of track with one lineman for every 13 miles of track.

Three Types of High-Tension Overhead Used in Switzerland

1. Double-track construction with 328-ft. spans. This type has intermediate wind bracing, as shown by pole in foreground.
2. Standard double-track construction, using simple catenary and pin insulators with 200-ft. spans.
3. Single-track construction with feeder. Note the H pole and bracket with knee brace.

Telephone and telegraph interferences have been handled entirely in the communication circuits themselves. On one of the early stretches of electrification, however, an experimental three-wire distribution system such as is used on the New York, New Haven & Hartford Railroad was installed. It was deemed unnecessary to continue this practice since cabling was necessary anyhow, so that sufficient protection was possible in the communication circuits themselves. The railroad has had to pay ⅓ the cost of all the cabling of the general communication circuits involved, as well as to cable its own circuits. The total cost has been in the neighborhood of $12,000,000.

The bonding was investigated from the standpoints of interference and the efficiency of the distribution system. Sections were run with no bonds, with partial bonding and then with total bonding. The results pointed to the need of bonding, but with no great certainty. Originally iron bond wires were installed. Then bonding at the base of the rail was tried but gave some trouble with rail breakage. Bonds oxy-acetylene welded to the head were not considered successful, either. The type of bond chosen was a copper rail-head type, electrically welded and provided with a full loop to prevent vibration breakage of the bond itself.

The selection of motive power has been complicated because of the close intermixture of heavy mountain grades and the long stretches of level track in the valleys and plains. This has necessitated equipment especially for the grade sections, in addition to the normal motive power. The choice of drive for the locomotives has also prevented early standardization. In the last few years results of long service tests have become available. These include three groups of passenger locomotives in similar work equipped with the three best known types of drives that are suitable. The characteristics of these locomotives, and the results as shown in the annual reports of the railroad, are shown in Table I.

With the Buchli drive, considerable trouble arose at the start from the lubrication of the sector centers and from entrance of dirt into the ball and socket joints. This was overcome and most satisfactory operation obtained. The smooth riding qualities of this type were noticeable. Too much labor was required to keep the rod drive in good condition at passenger train speeds on level sections of track. The quill type gave trouble with spring breakage and did not work well with a rigid locomotive frame. As a result the Buchli drive was chosen as standard for passenger service in level country, with either a 1-C-2 or a 1-D-2 wheel arrangement.

TABLE I—DATA FOR SINGLE-PHASE PASSENGER LOCOMOTIVES, SWISS FEDERAL RAILWAY

Wheel arrangement	1-C-2	1-C-2	1-C-2	1-C-1

Starting	40,000	57,000
One hour rating	23,000	37,000
Horsepower		
One-hour rating	2,040	2,240
Continuous	1,780	1,820
Number of motors	4	4
Number of locomotives	42	34

For slow-speed service, such as normal freight traffic and passenger traffic in heavy grade sections the rod drive has been retained. The standard types are shown in Table II.

On all motive power auxiliary and control apparatus has been standardized to reduce storehouse and maintenance costs. The same pantographs, oil switches, control equipment, etc., are furnished on all types, whether built by the Brown Boveri, the Oerlikon or the Secheron companies.

Digitized by Google

The locomotive transforming equipment consists of an oil-cooled transformer provided with taps for voltage control of the motors and a section for furnishing current for heating the train. The control apparatus is simply a double-sliding brush running over alternate taps on the transformer with interlocked automatic switches to prevent short circuiting of the coils.

Considerable discussion has arisen over one-man operation of the locomotives. Naturally the management considers this an opportunity to realize a saving. Train heating is electric except on international trains, where heating cars are provided, so that a helper in the locomotive is not needed for boiler service. A foot-actuated "dead man" device takes care of failure of the motorman. The labor organizations, however, have objected strenuously to any lay-off of firemen and they are quite ready to use any necessary political pressure to obtain their ends.

TABLE III—APPROXIMATE EXPENDITURES TO THE END OF 1926 AS SHOWN IN THE ANNUAL REPORT ON COMPLETED AND UNCOMPLETED PROJECTS

	Total	Per Cent
General	$9,000,000	8
Power plants	28,700,000	25
Transmission lines	6,700,000	6
Substations	6,500,000	6
Distribution	20,600,000	18
Changing of bridges, tunnels, etc., for clearance	2,600,000	2
Changes in communication lines	11,800,000	10
Shops	1,800,000	1
Motive power	38,400,000	34
Total	$114,100,000	100

The general capital expenditures for the electrification form an interesting review of the whole project both as to its size and the relative importance of the various elements. They are shown in Table III.

At the end of 1926 about 1,600 track-miles were electrified, with a route mileage of about 650 comprising some 36 per cent of the total mileage. In round figures, during 1926 11,000,000 electric locomotive-miles were run and 3,500,000 net ton-miles were hauled. This represented 42 per cent of the total locomotive mileage of the railroad and 56 per cent of the total tonnage hauled.

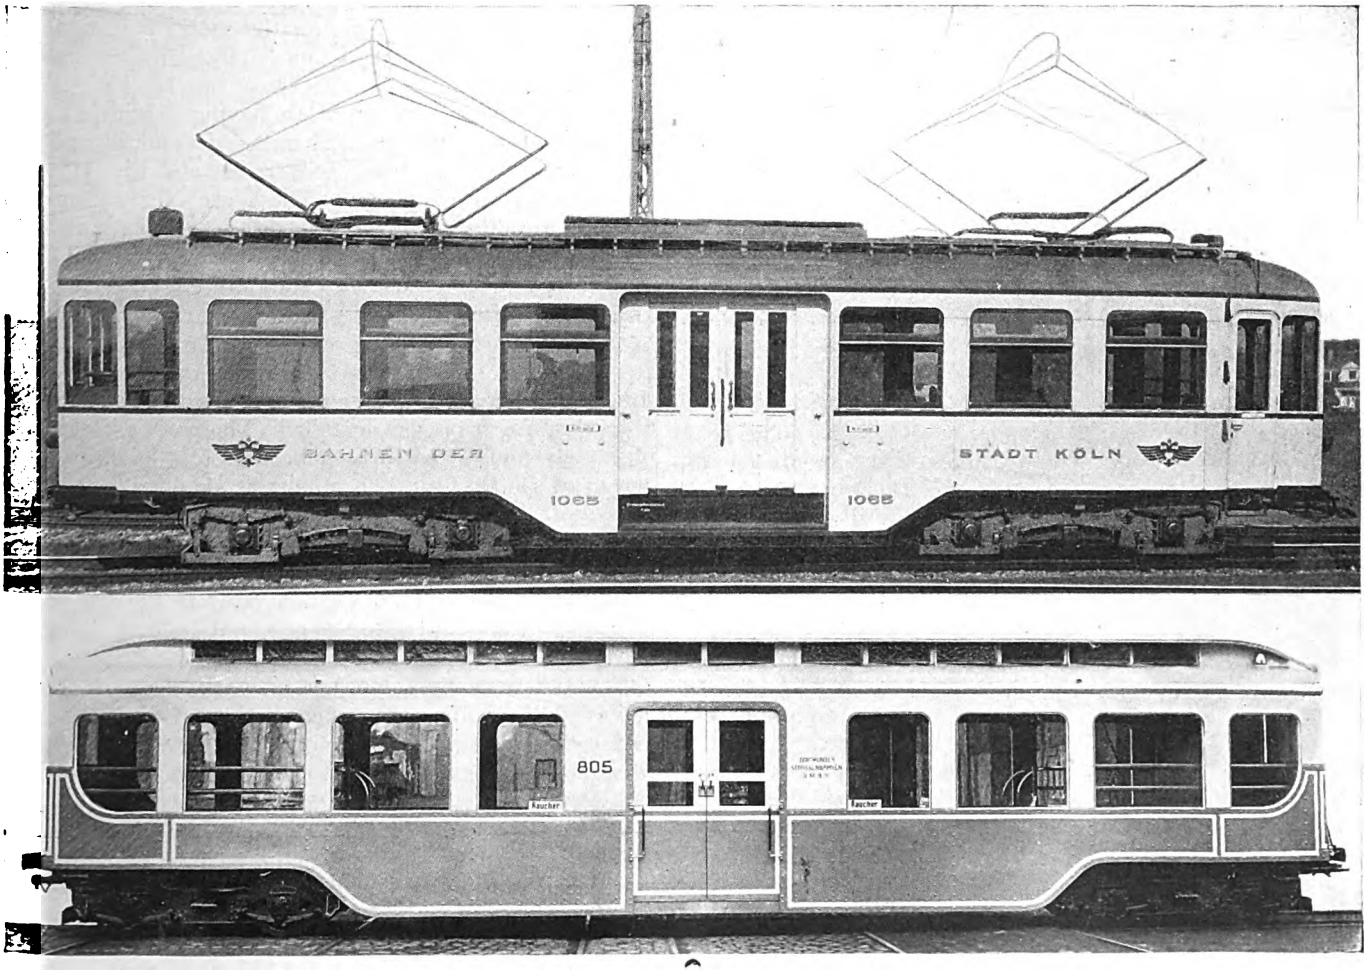
Recent Features of German Car Design

By R. Schwanter
Assistant Engineer City Transit Board, Cologne, Germany

Some methods of track construction in Germany, differing radically from those followed in America, were given in a brief article by the writer in Electric Railway Journal for June 16, 1928, page 979. The article this week relates to correspondingly great differences in car design, as illustrated by cars recently built for Cologne and its neighboring city, Dortmund.

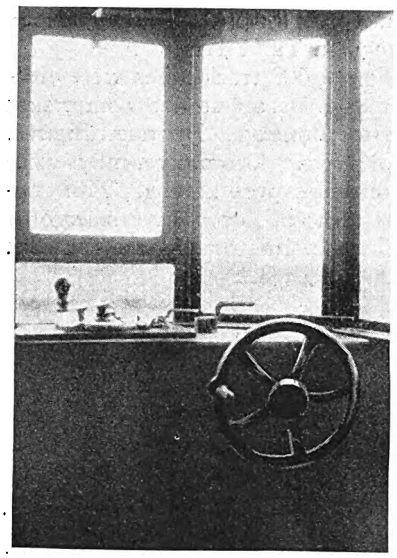
In these cities, as elsewhere in Germany and in some other countries in Europe, the electric brake, particularly the short-circuit brake, is employed extensively. Arguments for and against its use are many, but it may be said that the brakes on all of the Berlin surface cars have been changed from air to electric.

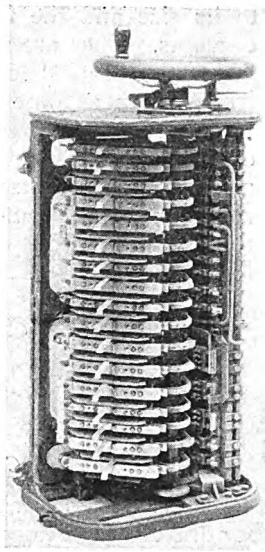
An accompanying illustration shows the appearance of the motorman's stand on a car equipped with an electric



The Cologne car is illustrated in the upper view. The Dortmund trailer is shown in the lower view

Digitized by Google





At left, motorman's stand with controller arranged for electric braking. At right, interior of manual controller for four-car train and 1,200 amps.

brake. The power controller drum also contains the brake contacts. Movement of the controller handle clockwise from zero position admits current to the motors for car operation. Movement of the handle counter-clockwise applies the brakes. The other handles shown in the view from left to right are the reversing handle on the controller, the sander handle, the hand-brake wheel and a handle to lock the lifeguard in a raised position if the paving between the rails is under repair. Another illustration gives a view of the latest cam-operated Siemens Schuckert controller, designed for four-car trains with two motor cars and an aggregate capacity of 400 hp. The control is tested for a starting current up to 1,200 amps. and 660 volts.

Front view of the Cologne car

The remaining views are of two recent suburban passenger cars, built by the Linke-Hofmann Works of Cologne. The first three relate to a four-motor car of the city of Cologne, painted white with green lines and gilt lettering. The side exterior view shows clearly the half-sliding, half-folding doors and the coat of arms. Points especially to be noted in the end view are the route designation "C," the ventilating louvers on each side of it and the arrangement of the sash in front of the motorman, with two hinged sections somewhat like the windshield of an automobile. Common American features embodied in this car, though not so frequently found in European cars, are roller shades at the windows and the arrangement to raise the lower sash. The features of the trail car are the low floor and large central loading well.

Guatemala Builds Electric Railroad

Tropical country opened up by electric railway after abandonment of twenty years consideration of steam rack railways

CONSTRUCTION of what is said to be the steepest standard gage electric railway in the world has recently been completed in Guatemala. Plans for this railway, which is known as the Ferrocarril de los Altos, were commenced twenty years ago. At that time several steam-operated rack railways were planned but, owing to the difficulties of the construction and working of a steam railway in the country, had to be abandoned.

Toward the end of 1924 the Allgemeine Electricitäts Gesellschaft of Berlin, Germany, proposed an electric railway connecting the plateau of Guatemala with the existing railway, crossing the southern part of the country and the tropical lowland. Eventually the company secured a contract from the government for the Ferrocarril de los Altos.

The first part of the work consisted in preparing the ground and rock, the construction of a dam across the valley for a 12,000-hp. power station, the erection of a transformer station and overhead transmission lines, the laying of the railway track, and the construction of bridges and stations, including the erection of an imposing station in Quezaltenango, besides the supply of the electric rolling stock.

The railway circles around San Felipe and passes out of the tropical region through the mountains on to the plateau and to the town of Quezaltenango, the total distance being 27½ miles. The track can be divided into three sections, one of 3¾ miles, having a gradient of 3 per cent, on to which the 12½ miles of mountain railway with a gradient of 9 per cent joins, and the 11¼ mile stretch across the plateau. There are ten intermediate stations in addition to the two terminals. In contradistinction to the other Central American railways the Ferrocarril de los Altos has a standard gage of 4 ft. 8½ in.

Energy is furnished by a hydro-electric power station in the neighborhood of the village of Santa Maria, 4,920 ft. above sea level. Two turbines, direct-coupled to three-phase alternators generating current at 2,300 volts, 60 cycles, are at present installed The power station will ultimately house five turbo-generator sets having a total output of 12,000 hp. The railway is supplied with direct current at 1,500 volts from one substation in the power plant and one at Quezaltenango, where the three-phase current, conveyed by a 50,000-volt transmission line, is converted. The current not converted to the use of the railway is transmitted for power and lighting purposes to various neighboring towns, including Guatemala City.

In addition to the construction work, the A.E.G. also delivered the rolling stock, consisting of six passenger motor cars, one passenger motor car for staff use, nine covered freight cars, two flat cars, and two petrol-driven cars for use on extensions and as reserves.

Each car is equipped with a compressed air brake and an electric short-circuit brake, the current generated on downward journeys being dissipated in resistance. They are also equipped with electro-magnetic track brakes, fed by an accumulator battery on failure of the main supply or of the motors. If all the above three brakes fail, a hand brake can be operated.

Courtesy Is the Key

to Platform Employee Salesmanship

The platform sales job is a peculiar one in that when the passenger boards a car the sale has been made. The sales job of the operator is one of producing continued patronage through simple business courtesy

By R. N. Graham
Manager of Railways Penn-Ohio System, Youngstown, Ohio

Speaking before the summer meeting of the Central Electric Railway Association, held June 26-28 at Cedar Point, Ohio, Mr. Graham propounded a philosophy of the work of the railway man which is somewhat different from that usually given. His point of view is worthy of thoughtful consideration by every operating executive.—EDITOR.

WE HAVE heard it stated many times that we have a product to sell; that our conductors are salesmen; that the superintendent is a sales manager. Perhaps it would be just as well to ascertain just what is the class of salesman to which our conductor belongs. The manufacturer and jobber that sell supplies to our companies describe their product, explain its use, and overcome sales resistance by pointing out the money that is to be saved by using the product. Manifestly, our conductors do not practice this kind of salesmanship.

Merchandise salesmen in stores likewise deal with certain commodities which the prospective purchaser may buy or not, depending on the efficiency and skill of the individual salesman with whom he comes in contact. It is the job of the salesman to convince the prospective purchaser that it is desirable for him to acquire this merchandise. Manifestly, the situation presented in such merchandising does not parallel that presented to the conductor on the street car.

When a patron arrives at a hotel the original sales transaction is already made. The owner of the hotel, the one transaction being accomplished, is interested in making so pleasing an impression on the patron that on future trips he will again confer his patronage upon this particular hostelry. However, the impression that is made and that determines whether the guest will continue to patronize a particular hotel is determined, so far as the effects of human contact are concerned, not only by the clerk but by the bellboys, the porters and numerous other officials and employees with whom he inevitably comes in contact.

The street car conductor's salesmanship requirements are more nearly comparable with those of the hotel employee than with the other classes mentioned above. An important difference, however, is that in the great number of transactions between the street railway and its patrons, the conductor is the sole employee involved. Conditions on a street car and in a hotel are similar, in that when the passenger boards a car the act of selling has already been completed; the merchandising function of the operator is to create a favorable impression so that the effect of the personal contact may give no reason why the passenger should not ride again.

It thus becomes evident that the training of street car employees as salesmen has similar objectives to the training of those many classes of hotel employees who come into contact with the guest during his sojourn; that whereas the hotel management must depend for favorable personal impressions on the combined efforts of numerous employees of different classes, the entire contact of the street railway company with customers during that period of time in which they actually are customers is confined to a single class of employees. The impression produced on the public at large is the sum total of the impressions produced by many individual contacts with individual platform employees. Salesmanship, so far as any positive action on the part of these employees is concerned, becomes identical and synonymous with courtesy.

COURTESY THE OUTSTANDING TRAIT

Now when we stop to think about it, isn't it just plain business courtesy that we expect from our employees in their contacts with passengers, in addition to efficiency in the performance of their routine duties? When we think of a conductor that has our full approval as an employee, don't we think of him as neat and courteous, polite and courteous, friendly and courteous, businesslike and courteous; the quality of courtesy always being the essential element? You can call to your mind the personality of a half dozen conductors that are the embodiment, to you, of the business qualities and practices that you would like to have characteristic of your whole working force. Do you ever remember any of these men using a specific sales argument? Isn't it true that they are men who efficiently perform all elements of their jobs and in their relationship with the patrons of the company are friendly and courteous?

On our property we receive numerous letters from our customers referring to individual car operators and bus drivers. I most readily call to mind bus drivers who have had occasion to handle special party trips. Frequently on such trips the driver is in contact with his customers for days and sometimes a week or more at a time. In an extensive business of this character, we have found that we have four or five drivers who are in constant demand by these group passengers. I know these drivers personally. They are alike in possessing certain characteristics; they are clean, neat, good tempered;

Digitized by Google

they are all intensely interested in the vehicles that they drive; they are interested in the trips which they take; they are interested in the pleasure and enjoyment that the passengers get out of the trip; capable and efficient in their handling of their buses, yet as I have reviewed them in my mind I cannot visualize a single one of them ever making what might be termed a sales argument. Neither would I know what to suggest to them to say that would further the sale of our product. Their work as salesmen is best performed by the qualities which I have enumerated.

Many of our properties operate cars either generally or wholly with one man; most buses are operated with one man. These operators perform functions other than the collection of fares or the furnishing of information to passengers. They must handle their cars or buses competently, observe rules of operation, be alert in the avoidance of accidents, be honest in financial transactions, be sober, neat and clean. But little of this can be classed as salesmanship. In the volume "Popularizing Public Transportation—1927," issued by the American Electric Railway Association, there are set forth in box displays certain principles which merit repetition: Principle No. 9 is "Salesmanship is a point of view as well as technique."

A Point of View

In my opinion, salesmanship as practiced by the platform employee is almost wholly dependent on a point of view. If the platform employee has it firmly fixed in his mind that the relation of the passenger to the company is determined by his own dealings with that passenger and that his prosperity and his job depend on that relationship, then good salesmanship in that employee's contact with passengers, may be expected.

The next principle is: "Manners make the salesman of transportation." Certain companies have gone to the extent of having operators make house-to-house canvasses to sell tokens or passes. Certainly no harm is done by such practice, but the ability of the employee to sell tokens or to sell passes under such circumstances is certainly no measure of his efficiency in his own peculiar selling job. I would not measure the efficiency of platform employees as salesmen by their ability to sell some intrinsic article; by their ability in arguing controversial questions in which the company might be interested, but almost solely by the reaction that they produce upon the passenger by their manner in carrying out the specific duties devolving upon them in their particular employment.

How are we specifically going to develop this selling quality which I make synonymous with courtesy? Will we develop it by a school of instruction? Certainly the new employees should be instructed in all the elements that go to make up their job, and since the matter of courtesy is of such major importance it should be emphasized and re-emphasized in the instruction. Are we going to develop a series of parrot-like answers to certain questions that may be asked, or phrases to meet certain conditions? Yes, because long experience has demonstrated that certain phrases cannot give offense and they are not parrot-like when used in proper manner by an employee with the proper mental attitude.

Are we going to permit men to remain on the platforms of our cars and buses who have not the necessary calmness and proper mental attitude? Surely the survival of a business that we believe one of essential convenience is of more importance than the tenure of one individual on a job for which he is not adapted. There is always some position that can be filled by a man who is industrious and efficient but who happens by nature to be a grouch or quick tempered. Are we going to permit disputes and arguments when the disputes and arguments at most can involve only a small coin or token, or are we by our rules going to transfer such arguments to our general office where we know that under all circumstances they can be handled with calmness and discretion? It is unnecessary for me to answer any of these questions. The answers are obvious.

Inculcation of Courteous Manners a Goal to Seek

The goal which we seek is to inculcate courteous manners in the platform personnel as a matter of business. There are three policies which, if faithfully pursued and carried out, go a long way toward reaching this end. The first is: let no public praise for courteous action be unnoticed; communicate every letter or message calling attention to the performance of a trainman or bus driver to the man involved. If a company organ is published, such letters should be printed; they should be posted on bulletin boards and due official credit given for the act which provoked the letter. Secondly, courteous conduct cannot be expected from employees who themselves are not the recipients of the finest example of such conduct. Therefore, suggestions from the platform employee should be welcomed; complaints should receive careful and painstaking consideration; questions should be answered frankly and fully; changes in schedule, in operating methods, even in fare collections, should be thoroughly explained in advance of taking effect; supervisors and instructors should be required to treat men with consideration, refraining from profanity or quarreling over trifles; rebukes or discipline should never be publicly administered.

Last, but probably most important of all, continuous contact must be maintained between the platform personnel and the official organization so that courtesy training may be a never-ending process. This contact must be other than that obtained during instruction when first employed; than that resulting from negotiations over wages or working conditions, or that which comes about through discipline. It must be a friendly contact, carefully nurtured and developed.

On our property we have had at least every 30 days, for five years, a dinner attended by some section of our working force, and also attended by officials of the company. In five years of constant meetings of this kind there is the opportunity to talk on operating practices without preaching. Results can be accomplished that are impossible in a classroom or in a mere sporadic meeting held now and then, in which the contact is almost certain to be official and formal. After years of meetings of this character, the platform personnel reflects the management's attitude to the public. If the official organization is "hard-boiled" and unsympathetic, the men will possess the same qualities; if the official organization believes in sincere, honest, courteous dealings with the public, the men must inevitably reflect the same tendency.

You have all been in hotels where you sense that courtesy is the keynote of the organization. Strangely enough, many times you find that atmosphere where the least is said about it in leaflets, pamphlets and propaganda. If courtesy is the guiding spirit of a transportation organization, there is little more left of the problem of salesmanship.

Concrete for Street Railway Track

Cincinnati Street Railway uses concrete for track foundation and pavement as standard. Method of relaying track on Madison Road is typical of this railway's practice

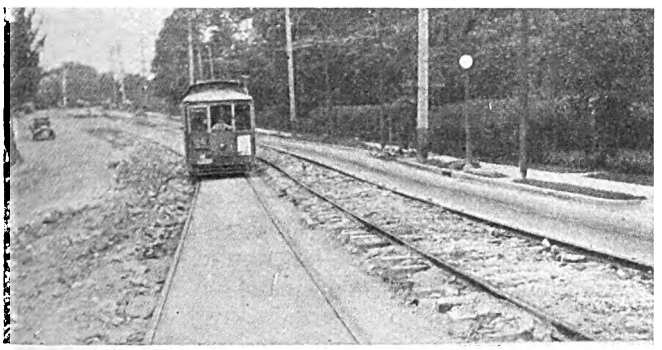
By C. C. Boone
Portland Cement Association, Columbus, Ohio

FOR several years street railway tracks in Cincinnati's paved streets have been laid on a concrete foundation. It was necessary, therefore, for the Cincinnati Street Railway, when it decided to relay the track on Madison Road and repave the road surface, to tear up a track laid in concrete ten years ago.

The old track consisted of 7-in., 96-lb. Trilby rails spiked to wood ties. Around the ties, to a depth of 6 in. under them and 4 in. above, was a foundation of 1:3:6 concrete. Upon this foundation was a wood block pavement conforming to the type of surface used on the balance of the street. The wood blocks were laid in the customary manner and the interstices filled with sand with only a small expansion joint between them and the rail. No tar was used. This bond loosened and made it necessary to relay the track.

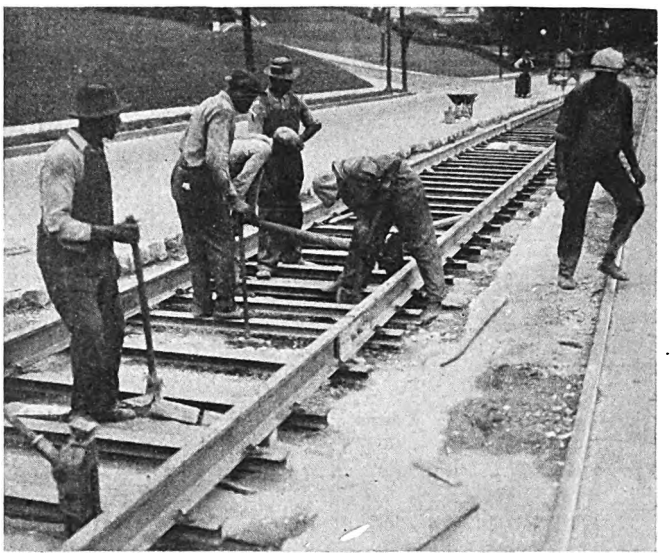
Madison Road has a double-track car line and carries heavy vehicular traffic as well as the trolley cars. To maintain service during reconstruction one track was completed at a time. A temporary track was built along the shoulder using as ballast materials excavated from the track under construction.

After the wood blocks had been removed the concrete around the base of the rails was broken loose and the rails were pried out. Then the concrete over the ties was broken with hammers and drills and the ties were lifted out with crowbars. The depressions caused by removing the ties left the old base very rough, assuring a good bond between it and the new concrete to be placed above.

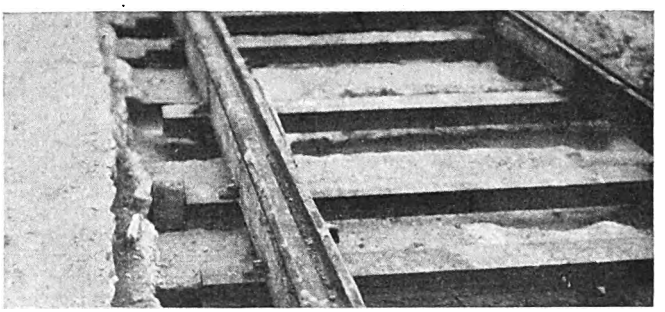


To maintain service during reconstruction work only one track is torn up at a time and a temporary track is laid. The temporary track as shown on the right is ballasted with material excavated from the track being rebuilt

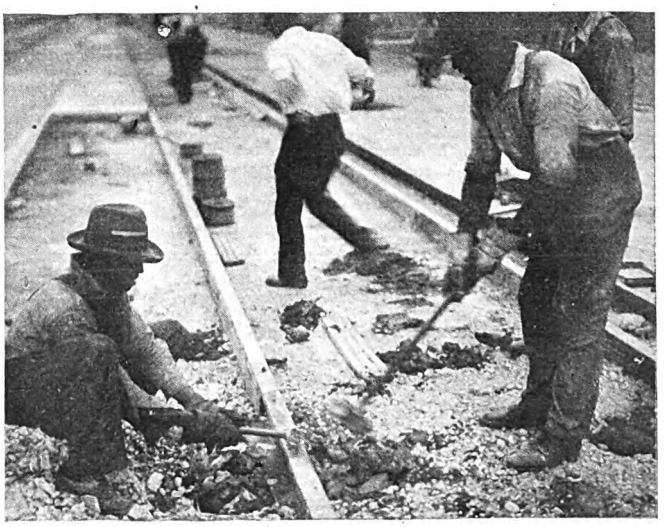
After the rails were removed, the concrete over the ties was broken and the ties pried loose with crowbars



New rails and steel ties were bolted together and the assembled track brought to grade with jacks

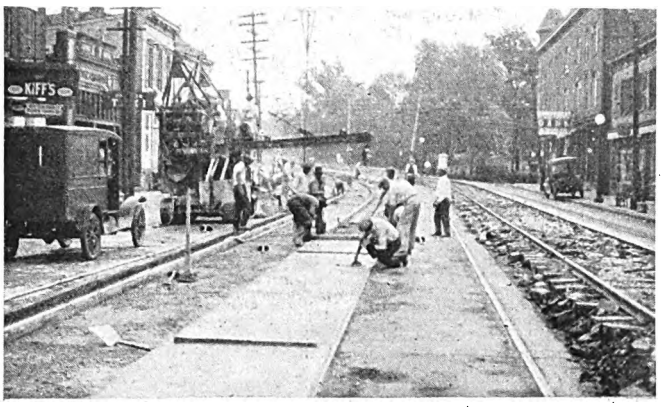


On curves the assembled track was held in line by blocks between the track and pavement edge



Cutting away excess metal at a welded joint. All bolts were spot welded and joints thermit welded

Digitized by Google



Concrete-pouring gang at work. The mixer was operated on the highway at the left of the track

The completed area. Workmen are removing the temporary track crossover used during the construction

The base was thoroughly brushed to remove all loose particles of concrete when the entire track had been removed and new 93-lb. T-rails were laid in place. They were bolted to steel ties and the assembled track brought to grade. The proper grade and alignment was maintained by placing wood blocks under every third tie after the track had been jacked to position. On curves the track was braced by inserting blocks between the ties and the adjacent pavement.

After the track was in grade and in line, all bolts were spot welded and joints thermit welded. The joint welds were later smoothed by cold cutting and grinding.

A premolded elastic material was placed along both sides the rail web and a bottom course of 1:3:6 concrete poured. This course extended from the old grade to within 5 in. of the top of the rail. The concrete was carefully tamped around the ties and rails to assure a good bond and perfect support. On new work the base course extends 6 in. below the ties.

After the base course had hardened, a 5-in. wearing course of 1:1½:3 concrete was laid. Expansion joints ¼ in. wide were inserted at 30-ft. intervals, and the edge of the street pavement, 18 in. from the rails, was painted to prevent the bonding of concrete of the highway and that in the track area.

The cost of rails, steel ties, concrete and the construction work averages $10 a lineal foot for single track in Cincinnati.

P.R.T. Central Parking Area to Relieve Congestion

SEVERAL years ago large parking fields were established by the Philadelphia Rapid Transit Company at the terminals of its Market Street-Frankford elevated, to influence autoists to park their cars elsewhere than on the crowded downtown streets. Now a new parking area has been added to the chain of fields, this one in the very heart of the city.

The property being used for the parking area is on Locust Street between Broad and Fifteenth Streets, just across from the Mitten Building, where the P.R.T. and Mitten Management offices are located. The property will eventually be the site of a combination bus terminal and public garage.

The company, in its announcement to the public, stated that the area would be operated on a no-profit basis, a fee of but 25 cents being charged for an eight-hour period. Since the only other near-by location for off-street parking charges a minimum parking fee of 50 cents, it is evident that little effort is required to keep the P.R.T. field filled during the daytime and evening

Parking area conducted by the P.R.T. where Philadelphia motorists can store their cars for an eight-hour period for 25 cents

Digitized by Google

hours. It has a capacity of 160 cars and a staff of seven attendants is required to handle the field on an efficient basis.

At night the Locust Street field is well illuminated with powerful floodlights located on tall poles near each of its four corners. Twenty-four-hour service is given, at least one man being on duty at any hour of day or night. Cars are checked in and out through the Locust Street entrance. The times of entering and the license numbers of the automobiles are entered on the parking tags. For cars which are parked more than eight hours an additional charge of 5 cents per hour, with a maximum of 75 cents for 24 hours, is made.

The parking situation in Philadelphia is particularly acute and the construction of double-deck streets and the widening of existing thoroughfares has been suggested from time to time. The company feels that parking areas in the downtown district would relieve the situation, and is pointing to the Locust Street field as an example of what can be done in this respect.

Automatic Safety Signals on South Shore Line

SAFETY signals of the automatic type on the open right-of-way of the Chicago, South Shore & South Bend Railroad will be in operation from South Bend to Chicago with the conclusion of installation work now under way, according to a recent announcement of Charles H. Jones, general manager. The present program contemplates the installation of double-track signals from Gary to Kensington, exclusive of cities. A new high-speed siding at Tamarack, four miles west of Michigan City, will be protected by switches and signals also.

The new double-track signals between Kensington and Gary are spaced so as to allow fifteen-minute intervals between trains. They are of the three-color light type, with special protection over the bridge gauntlets and approach locking through interlocking plants. When a train has accepted the signal 1 mile in advance of the interlocking plant the operator is prevented automatically from making any change in the routing of trains, and from allowing any other trains to enter the plant. Arrangements like this will be in effect at Shearson, State Line and Kensington.

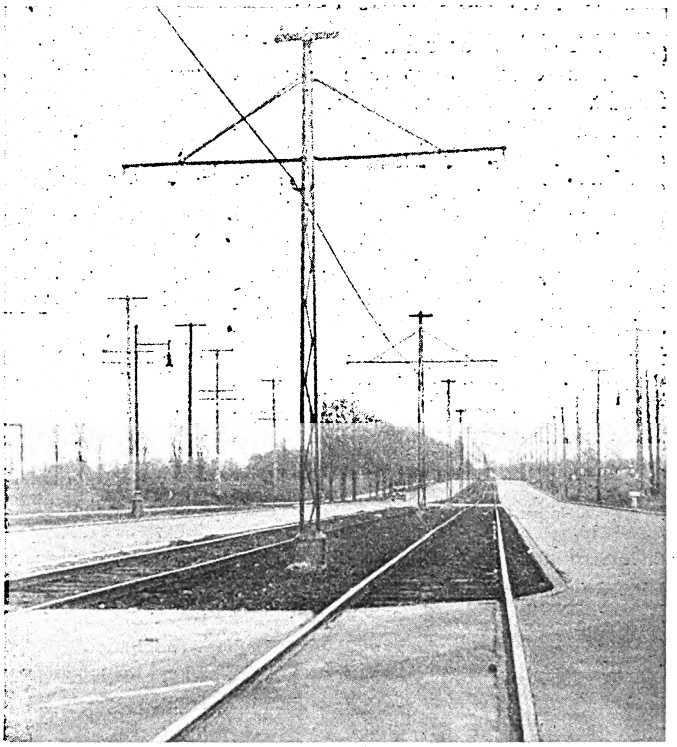
The signal protection at the new Tamarack high-speed siding will allow trains to pass in and out of the siding without stopping. The switches are of the spring type except for westbound trains. If anything happens to the switch, or should the points open up $\frac{1}{8}$ in., the signal ahead of the point will flash danger, stopping the train before the switch point is reached.

The signal installation will cover approximately 15 miles. A gang of 30 men including laborers will spend the larger part of the summer months on this job, which is under the direction of Ben L. Smith, supervisor of signals for the South Shore Line.

Louisiana-Mississippi Committee Reports

IN A twenty-page booklet the report of the fifth year's work of the Louisiana-Mississippi Committee on Public Utility Information is published. H. M. Blain, director, referred to the co-operative spirit of utility companies now in comparison with some time ago on the matter of publicity. In previous years, he states, the Public Utility Information Bureau had to give up after writing several letters for special utility progress stories, but recently the bureau had been able to get similar material from almost all companies through only one request. The distribution of utility literature to schools is recorded and the activities on public speaking are reviewed.

Completed Island Track Construction in Erie, Pa.



EXTENSIVE construction work on Erie Lake Road as carried out by the Erie Railways was described in an article on page 784 of the Oct. 22, 1927, issue of ELECTRIC RAILWAY JOURNAL. At that time the work was in progress and construction pictures were the only ones obtainable. The view shows the completed construction with the track in the center and a paved driveway on either side.

The Readers' Forum

Traffic Control a Vital Issue

GENERAL MOTORS TRUCK CORPORATION
PONTIAC, MICH., July 20, 1928.

To the Editor:

In your issue of July 7 there appeared an editorial entitled, "Signals Should Move Traffic, Not Stop It." I read this article with great interest. It is a subject which in my judgment has been too long neglected. Of course, much has been written on the question, but little that has been written has been constructive or educational. It would seem to me that this subject is one that could be pursued much further not only in the interest of the street car and bus industry, but in the interest of society as a whole, since practically everyone is affected directly or indirectly with things which have to do with the movement of traffic.

Maintenance Methods and Devices

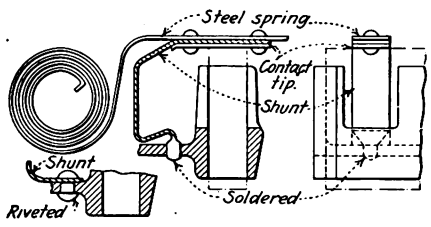
Fastening Shunts to the Body of Brush-Holders

By John S. Dean
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

On the older railway motors it was common to use carbons fitted with shunts or pigtails. These were considered essential to help carry the working current into the carbons, and thus keep it from passing through the pressure finger mechanism of the brush-holders. In practice these shunts tend to work loose and quite frequently are left off through carelessness, thus allowing the current to pass through the bronze pressure springs. Then the heat anneals the bronze and the springs lose their tension. Frequent adjustments are needed to maintain the proper tension on the carbon brushes.

Brush-holders used with modern railway motors are designed with a heavy braided shunt connecting the contact tip on the pressure finger to the body casting. This makes it possible to use plain carbons and eliminates pigtails, which always were considered more or less of a nuisance, especially by the men in charge of their maintenance. Two general methods are used to attach these shunts to the brush-holder castings. These are riveting and soldering. As some trouble has been experienced with the riveted type working loose and getting hot in service, modern brush-holder practice is to use the soldered connection almost exclusively.

In making repairs to brush-holders using this latter method it is essential to do a good soldering job. Parts to be soldered should be cleaned well and then tinned. A soldering tool of fairly good size should be used. One weighing about 3 lb. gives good results and holds the heat for a long time. The iron should be kept well tinned and the surface filed clean. After heating the iron should be dipped in a strong solution of zinc chloride. This is made by putting zinc in commercial muriatic acid until no more will dissolve. A good hot iron is essential for proper work. The solder should be rubbed on the hot iron and a zinc chloride flux used. A handy form of solder comes in thin strips 10 in. to 12 in. long. Ordinary half and half solder is satisfactory.

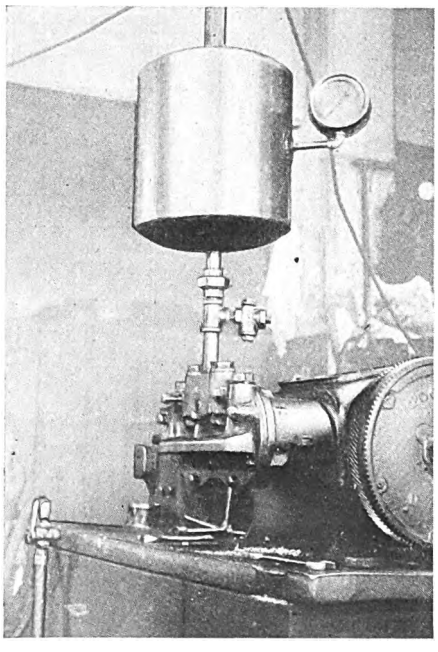


Method of attaching shunt to twin washer brush-holder mechanism

Air Compressor Testing Equipment

Final testing of air compressors has been simplified in the shop of the New York & Harlem Railroad, New York City, since special testing equipment was constructed. The air was pumped into a 16x48-in. reservoir prior to the adoption of this outfit. This not only required a longer time to obtain the pressure required but increased the energy consumption and caused a longer period of idleness for the mechanic. The apparatus shown in the accompanying illustration is portable and can be installed or removed in a few minutes. It consists of a 13x14-in. reservoir with welded seams, a standard safety valve, a gage and a valve with the necessary pipe fittings. The outlet of this valve is plugged. A hole is drilled through the center of the plug so that there is a small air exhaust when the valve is opened and the compressor is under pressure. This leak corresponds to the average leakage which exists in a car.

When the compressor is ready for test the apparatus is installed in the outlet, the valve opened and the pump started. As the pressure increases the air escapes from the drilled plug. The compressor must pump air to 100 lb. pressure against this leak in a predetermined time. When this pressure is reached the valve is closed off, the compressor stopped and the gage observed for any drop in pressure. This is done to determine if the valves, rings, etc., are fitted properly. If the compressor pumps to 100 lb. pressure in the proper time against the exhaust and there is no appreciable drop in pressure the compressor is pronounced OK for service. The pressure is then released and the apparatus removed.



Compressor testing equipment in shops of the New York & Harlem Railroad

Convenient Forms Assist Bus-Maintenance*

By D. S. Mackay
Supervisor of Bus Maintenance
Boston Elevated Railway, Boston, Mass.

When the Boston Elevated Railway began the equipment of its buses with tires purchased on a contract mileage basis, considerable difficulty was experienced in keeping track of tire equipment or changes necessary due to puncture, wear out or other causes. To assist in keeping records of the correct mileage performed by each individual tire, one of the clerks in the rolling stock department devised the four forms illustrated.

The 5x8 in. card, Form 3791, is used at all bus garages. On it information of the original equipment is entered at the top of the card. Each change thereafter is entered

**Submitted in* Electric Railway Journal maintenance contest.

Digitized by Google

underneath and the record is continued on the back of the card. These cards are set up numerically by way of property bus numbers, and are of great value, for at any time the card for any particular bus can be picked out and a complete record obtained of all the tires on it, together with tire changes, date, positions, cause of removal, mileage, etc.

Form 6478 is used by the men who change tires. When a change is made this form gives full information. It is filled in by the man who makes the change, signed by him and then turned in to the garage office.

The record is transferred to Form 5765 by the garage clerk, and at the same time this is forwarded to the office of the supervisor of automotive equipment. Upon receipt of these reports the changes are recorded on Form 5766, this being the final report. Five copies of this are made out, and forwarded to the superintendent of rolling stock and shops, to the bureau of audit, to the purchasing department, to the contract party and to the office files.

The four forms illustrated are used in conjunction with each other and were drawn up and printed for the sole purpose of keeping a correct record of tire mileage on a contract basis. At the present time the company is operating approximately 1,500 tires on a contract basis, and with this large number there is practically no error. A large saving has resulted in keeping records of tires along with the elimination of much confusion which existed before the system was inaugurated. All mileage is abstracted by the audit bureau and by the tire companies from these reports, and invoices are submitted to the company monthly of the mileage operated.

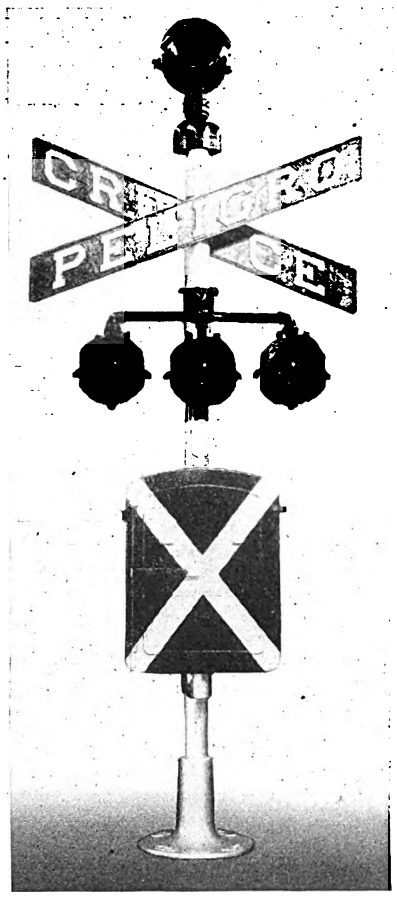
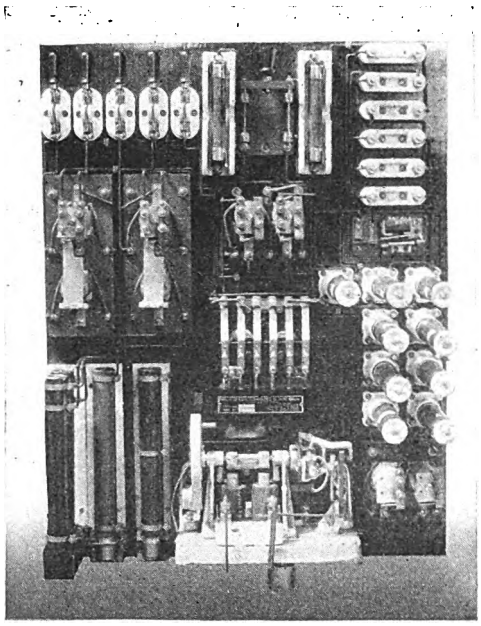
New Equipment Available

Crossing Signals for Peru

HIGHWAY crossing signals recently made for the Lima Light, Power & Tramways Company, Lima, Peru, by the Nachod & United States Signal Company, Louisville, Ky., embody some interesting features.





At left—One of the new crossing signals recently made for the Lima Light, Power & Tramways Company

Above—The relay panel taken out of the relay box, containing the various relays, the mercury-type flasher relay being shown at the bottom of the panel. Disconnecting switches are provided as shown at the top

A signal is placed on one side of the track, containing the bell, light indication and control box, together with the crossing sign with Spanish wording, meaning, "Crossing—Danger." A similar crossing standard is placed on the other side of the tracks but is without the control box or the bell. The relay and overhead contact system are for a double-track grade crossing of an interurban line with a highway. Normally when no car is approaching, the middle projector displays a green light, but when a car approaches the starting contactor about 1,200 ft. in advance it starts the operation of the warning, the green light is extinguished and the two outer red lights are flashed alternately by means of a flasher relay in the relay box. At the same time the red projectors flash, the 12-in. vibrating bell rings, thus giving both an audible and visual indication. In order that the motorman may know that he has started the signal in operation, a tell-tale or pilot is provided about three spans in advance of the starting contactor consisting of a hooded light signal, normally dark, which is then lighted up. The warning continues until the car passes under the stopping contactor beyond the highway.

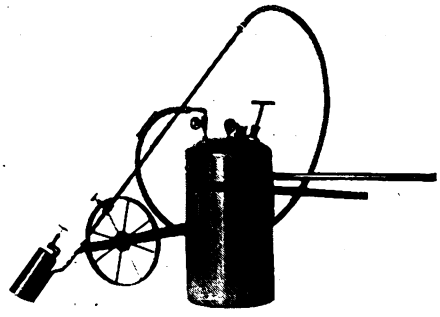
The other track is similarly equipped with trolley contactors and indicator. Separate relays are installed for each track so that so long as a car on either track is between the starting and stopping contactors, the warning will continue to be given.

The control of these signals is on the normal closed-circuit system. Should the relays drop for any cause, as through defective contactors, broken line wires or burnt out relay coils, the warning indication will call attention to the derangement. In order to prevent excessive ringing of the bell, a thermo-relay is provided as a time element cutout, which will stop the bell after, say, one minute's ringing and thus prevent annoyance to the neighborhood. In such an event, the lights continue to flash until the relays are picked up again. All current to ring the bell, flash the lights and control the relays is taken from the 550-volt d.c. trolley circuit. The projectors utilize 50-watt lamps, series connected, and shunted by resistors so that the burning out of a lamp does not open the circuit to the remaining lamps. The form of pipe brackets for the projectors serves to enclose the wiring and yet permit of pointing the projectors in any direction. The projectors have parabolic mirrors with 30 deg. Spredlite roundels.

Wheelbarrow Mounting for Oil Burner Tank

INCREASED use of kerosene torches in railway and highway service has resulted in the production of large capacity tanks for such equipment which are too heavy for handling by one man. To avoid the necessity of using two men for such kerosine burners the Chausse Oil Burner Company Elkhart, Ind., has announced a model with the tank mounted on a wheelbarrow. This outfit can be transported easily by the man who does the work.

A conventional type of welded steel tank with a capacity of 14 gal. of kerosene is mounted in tubular steel shafts with a single wheel. The kerosene burner is attached to the tank by means of a heavy-duty pneumatic tool hose. The tank has a self-contained air pump and pressure gage. The burner handle is steel with wooden grips and a convenient needle valve.



New type mounting for heavy kerosene tank used with oil burner

The burner is self-generating and produces a temperature from 1,750 to 1,800 deg. F. The volume of gas is considerable and makes this outfit adaptable to such work as preheating for welding, thawing, melting snow on tracks and switches, and wherever an intensely hot flame is desired.

Systematizing Bus Maintenance*

Accurate records make it possible to locate the causes of defects and so to prevent their recurrence. The forms discussed are used on a property operating some 75 buses

By L. McInerny
Master Mechanic San Antonio Public Service Company, San Antonio, Tex.

MORE than 50 per cent of the street railway properties in the United States are now operating some bus service, according to recent reports. This, supplemented by the continued purchase of buses by street railways, insures that bus maintenance is, or soon will be, a problem for the majority of electric railway maintenance men.

A satisfactory bus maintenance program for any property will, of course, be determined somewhat by the type of vehicle operated and by the service requirements. Our method as outlined in the following is still in process of development. It is offered for what the experience gained in the operation of 8,000 bus-miles per day may be worth.

Effective bus maintenance appears to be necessarily based on these five requisites: (1) Capable mechanics; (2) accessible supply of standard repair parts; (3) modern and ample shop facilities; (4) a definite and pre-determined inspection, lubrication and overhaul schedule; (5) effective supervision through accurate and graphic records.

Capable Mechanics

The introduction of modern and complex bus equipment, has made the need for qualified mechanics more apparent. In San Antonio only mechanics are engaged who have had as a grounding a course in manual training or trade school instruction in auto mechanics, supplemented by practical experience. Then, to keep the thought of their qualifications prominently in their own mind, as well as in the mind of their foreman, the latter is required to fill out and file twice a year in the shop office a qualification card, rating each man on his knowledge of the work, his industry, physical and mental qualities, care and disposition. Thus the foreman is prepared to assign his men to the most suitable work, the men being specialized as far as possible on some particular job such as inspection, electrical repairs, brakes or motor overhaul.

Mechanics are encouraged to enroll in night or correspondence school courses in their line of work by a standing offer to refund the cost upon the completion of the course. The study of their work is further encouraged by the reading of prepared papers at monthly meetings of shop foremen.

Abstract of a paper presented before the semi-annual meeting of the Electric Railway Association of Equipment Men, Southern Properties, Cincinnati, Ohio, July 25-27, 1928.

Accessible Supply of Standard Repair Parts

Assuring a supply of replacement parts is a problem that immediately follows the introduction of each new type of bus. Occasionally a considerable lag appears between the delivery of new equipment and the setting up of a functioning parts supply department by the bus manufacturer. The manufacturer should realize that the operator lacks information as to what constitutes a reasonable supply of parts for the particular type of equipment, and the latter has a natural reluctance to invest heavily in a stock of parts that may not be immediately required. Our experience indicates that the stocking of a complete variety of repair parts clearly labeled and indexed in a supply room included in or immediately adjacent to the garage is essential to economical and effective bus maintenance.

Modern and Ample Shop Facilities

All buses of this company are serviced at one garage, which adjoins the car house and shop. The carpenter, paint, blacksmith, machine, and welding shops are used in common for buses and street cars. However, certain bus maintenance facilities are required in addition. The climate in San Antonio permits of open yard parking throughout the year, the shop proper, including inspection pits and service station, being the only roofed area. Pit facilities are in the ratio of one for each twelve buses owned. This appears to be inadequate and it is believed it should be increased to a ratio of at least one to eight.

In addition to the rather complete set of hand tools which each mechanic is required to possess, and to the smaller special shop tools such as gear pullers, jacks, engine stands, portable drills, valve refacers, and high-pressure lubricating guns, some type of overhead crane and hoist, an arbor press, a universal test rack for electrical equipment, a battery charger, a brake tester, and an engine and chassis spray cleaner are considered practically indispensible. Equipment will, of course, vary somewhat in detail according to the number of buses maintained and the policy of the operating company with regard to investment in shop equipment.

One unit which appears to afford a good return on the investment where the volume of oil draining justifies is an oil reclaimer. Our experience records 80 per cent of drainings salvaged at a reclamation cost of 20 cents per gallon.

Inspection, Lubrication, and Overhaul Schedules

Since effective maintenance is not so much a matter of making repairs as of anticipating the need of repairs, a well-balanced inspection, lubrication, and overhaul schedule is probably the most important factor. Nightly servicing covers gasoline, crankcase oil, radiator water, and casing air pressure inspection. Other inspection and lubrication of buses is on a mileage-time basis by predetermining a mileage interval and translating it to a time interval. These are based on a 500-mile service expectancy, or twice a week. The fleet of buses is divided into seven groups, a group becoming the inspection quota for each day. This means the inspection cycle covers one week and that the schedule assigning certain bus numbers as quotas for particular week days will repeat indefinitely without derangement. The inspection and lubrication are recorded on a card, one side of which lists the detailed work of the day crew and the reverse side showing that of the night crew. This form also shows the lubricant to be used for a given operation. A thorough overhaul is given each bus yearly, or after approximately 50,000 miles of service. A supply of the smaller spare units such as generators, transmissions, differentials, cylinder heads, etc., is kept available for service, and if trouble develops between overhaul periods, the defective unit is replaced by a reconditioned unit. The defective unit is in turn reconditioned and placed in stock.

Records and Supervision

The details of all repairs rendered to buses, whether on trouble calls, defective buses relieved, or operators' after-service reports are recorded on cards by the mechanic making the repairs, these cards being filed under the bus number. As the first duty each morning, all service repairs required the previous day are entered on what is termed the bus trouble chart. This is a large sheet of paper with ruled lines listing all bus numbers in the fleet vertically at the left and the dates of the month horizontally along the top of sheet. All bus defects are recorded by using the letters of the alphabet as symbols. These symbols for the previous day are entered under the proper bus numbers and date. It affords a graphic history of all defects, or any particular defect for all buses, or the defect history of any particular bus as far back as it is desired to go.

This chart is used to give immediate

Digitized by Google

notice of the trend of defects, as well as any appreciable change in the number of particular defects; and to detect any repeaters. Cases of this nature are immediately called to the foreman's attention by a blue card citing previous similar reports and requiring immediate attention. The chart is used to track defects which apparently are due to the failure of a mechanic or inspector to properly perform his duty. This is done by checking through the file to determine when and by whom the repair or inspection was rendered. If it appears to be a man failure, a form with details filled in, is sent the individual.

The written form is used in preference to the oral in calling attention of mechanics to failures of importance. It is believed that having the mechanic explain the failure in writing, with the knowledge that unless satisfactorily explained it will be filed in his personal record, clothes the occurrence with more importance in the mechanic's estimate and makes correction more effective.

Other records maintained are an equipment card for each bus on which is recorded all important repairs and changes in equipment—together with date, mileage, and cause; a mileage sheet for each bus showing daily mileage and mileage to date; and a casing record showing the type, serial number, cost, period of service, and mileage rendered by each casing.

Curves are plotted for each bus to show the gasoline and oil mileage, and also to show total maintenance cost for each group of buses, classed according to make and size.

Monthly bulletins are posted for the information of shopmen, summarizing the pull-ins, repeaters, and inspection failures during the month and comparing the record on a mileage basis with the preceding month and year.

Average miles operated per bus failure during the six-month period ending June 30, 1926, were 2,045, compared to 2,381 miles for a like period of 1927 and 3,337 miles this year to date. Although average age and size of units has increased appreciably, bus maintenance cost per mile operated records a 9.3 per cent decrease during 1927, and a 11.4 per cent decrease for the year 1928 to date, compared to the 1926 base.

Employment and Training Methods in San Francisco*

By L. A. Bragg
Superintendent of Employment and Training, Market Street Railway

REALIZING the value of the proper selection and training of men for platform service the Market Street Railway some few years ago set about to develop methods to meet its own peculiar requirements. At that time it was the practice to assign recruits to line instructors who, having broken them in on one line, would turn them over to a different instructor for breaking in on another, and so on until the entire division had been covered. This led to a considerable duplication of effort and the general results were unsatisfactory.

We therefore inaugurated a system of assigning one instructor to break the student in on all the lines in his division, and holding him responsible for the results obtained. In order to perfect the system and to stimulate interest among the instructors, weekly meetings were held at which there was open discussion and a general exchange of opinions as to the methods to follow to secure the best results. The ideas brought up at these meetings were given practical tests, and the results observed and discussed at subsequent meetings. This process was followed out until all concerned were satisfied that we had decided upon the best method of handling each phase of training.

**Abstract of a paper presented at a meeting of the California Electric Railway Association, San Francisco, Cal., May 7-8, 1928.*

While the development of this training process was followed with close attention by the management of the property, the significant fact is that the system is the product of the line instructors themselves. These men naturally feel that the idea is their own and they accordingly enter into the spirit of the thing with greater zest and interest than they would had it been prepared otherwise. To this feature can be attributed its major success.

As each instructor is held personally responsible for the performance of his students, not only while the training is in process, but during the entire probationary period, a keen and friendly rivalry has sprung up among them in their efforts to outdo one another and to turn out men who will be a credit to their efforts and to the company for which they work. In order to stimulate this interest a careful check is kept on the performance record of each man trained, covering knowledge of rules, efficiency, care in avoiding accidents, deportment, etc. These averages are published from time to time in the company's house organ, and credit for excellence is given to the instructor responsible for the man's training.

In addition to the preliminary work done by the line instructors we have also established a follow-up system of instruction, extending through the probationary period of three months, during which time the men are given such additional training as appears necessary.

At the time this new system of training was inaugurated the employment and training departments were combined under one head and placed in charge of one man. To this can be attributed a great deal of the success attained, as more or less friction between departments has been removed. We do not pretend to have developed any new or unusual methods of selecting men for train service. We employ no tests, psychological or otherwise to determine fitness, beyond a simple medical examination and an ability to read and write the English language with fair proficiency and to do simple problems in arithmetic. We depend almost entirely on personal judgment and character study, backed by satisfactory references. Other things being equal we prefer married men or men with family ties. An effort is made, of course, to avoid the floater or transient worker, and to secure men of character, honesty and sobriety.

No man is employed until the work is explained to him in every detail. The unpleasant features, such as the irregular hours, the uncertainties and hardships of "bucking the extra list," the necessity of holding themselves at all times on call, etc., are emphasized and pointed out so that there may be no misunderstanding on these scores. Every effort is made to determine a man's fitness, willingness and ability to carry out the obligations that will be imposed upon him before he is even turned over to the line instructors for training. By this method we are able to eliminate those easily discouraged and to materially reduce the labor turnover.

Preliminary Examination by Superintendent Is Thorough

After the men have passed the preliminary examination they are taken in hand by the superintendent of employment and instructed as to the general policies of the management, special emphasis being placed on this in order that they may start out with the proper viewpoint. Instruction in accident prevention and the preparation of accident reports follows, together with a lecture upon public relations, the importance of courtesy and diplomacy in the handling of passengers, and the necessity of cultivating the good will of the public. In this manner the job is pretty well sold to the new man and he is in a better frame of mind to receive the actual training in the handling of his car which is to follow.

After this preliminary training the men are taken in hand by the chief instructors, who teach them the rudiments of the work. They are then turned over to the line instructors for the actual training on the cars. When it is thought that they have qualified in this respect they are required to pass a general examination as to their fitness. If this is satisfactory they are passed to the probationary list on which they are retained for a further three months. At the conclusion of this period they are again thoroughly quizzed, the examination covering rules, company policy, knowl-

Digitized by Google

edge of equipment and requirements of operation. If their first year of service proves satisfactory and indicates that they have profited by their training and experience they are given a certificate of proficiency.

The methods employed have been very successful. In spite of aggravating and hazardous conditions we have been able to show a decided decrease in accidents. Considering only men in training, that is to say, during the probationary period, the decrease is about 70 per cent as compared with former methods, certainly a very creditable showing. Comparing 1927 with the previous year there was a 40 per cent decrease in labor turnover, while for the first four months of 1928 the turnover was less than one-half of that for the corresponding months of 1927.

The work of the instruction department has at all times been accorded the fullest support of all departments of the company and of all of the officials from the management down. Without this it could never be the success that it is. But the outstanding feature of it all has been that the men who actually do the training, having been instrumental in building up the system, feel a personal responsibility for its success, and have gone about the performance of their duties in this connection with a zest and enthusiasm which would otherwise have been lacking.

Correcting Radio Interference*

San Diego Electric Railway has developed methods of locating and correcting troubles reported by broadcast listeners

By G. W. Shaver
Superintendent of Maintenance, San Diego Electric Railway, San Diego, Cal.

SOME two years ago complaints were made to the San Diego Electric Railway that its lines were producing severe radio interference. A committee composed of representatives of various civic and technical organizations made an investigation with portable receiving sets to find if the railway really was causing the trouble.

The interference under investigation, generally referred to as the "rock crusher," has no definite period, tone or note. It is something like heavy static and covers the entire broadcasting frequency band, having a maximum at approximately 1,000 kilocycles. The noise appears suddenly and lasts for intervals varying from a few seconds to several minutes. It is reduced in intensity after nightfall. While the interference covers a very wide area, it was much more severe along the trolley line. An increase in the intensity was noted as the portable set used for tests was moved under any wires, although all efforts to connect the noise with movement of individual cars were unsuccessful. It was decided that perhaps the interference noted at a given point was the result of disturbances set up by several cars which might be some distance away. To determine this, tests were made at night when there was only one car on the line. At that time it was noted that the characteristic noise started and stopped in synchronism with the movement of the car with power on the motors. It was also apparent that the air compressor motor caused a continuous roar of mild intensity.

The investigation leads to the belief that commutation of the motors and sparking at the trolley wheel set up highly damped oscillations which are conveyed to the trolley wires. Power and telephone wires pick up this interference by induction and reradiate it. The reduction of this interference after nightfall is probably due to the increased absorbing effect of the comparatively large lighting load of all of the cars, which forms a non-inductive path between trolley and ground.

The next step was to find a remedy. Two solutions presented themselves, one to improve commutation and reduce sparking at the trolley wheel, and the other to prevent the disturbances set up from reaching the trolley wire. Since the commutation was considered very satisfactory it was decided that the disturbances must be prevented from reaching the trolley. A low pass filter was designed, which consisted of a 300-microhenry inductor connected between the car side of the inductor and ground, the theory being to provide a low impedance path for the direct current between trolley and car and at the same time offer a high impedance to the high frequency currents between car and trolley and shunt them off to ground through the condenser.

Tests made on a section of the trolley which could be isolated from the rest of the system showed that the filters eliminated about 80 per cent of the interference. It was observed during this test that when a car without a filter entered this sector it caused severe interference, although the car was at times more than 1½ miles from the observing point.

In a further investigation a car equipped with four Westinghouse 514-A-3 motors was jacked up in the carhouse in such a manner that the motors could be rotated. A single-wire antenna about 40 ft. long, parallel to and about 3 ft. from the trolley, was connected to a six-tube Atwater-Kent radio receiving set. Running one motor at a time, it was observed that No. 1 motor caused severe interference when turning in one direction and practically none when reversed. On the other hand No. 2 motor caused practically no interference when rotated in either direction. The main series field of motor No. 2 is permanently connected between armature and trolley, while the main series field of motor No. 1 is permanently connected between armature and ground, but the commutating field is connected between armature and trolley when the armature revolves in the direction in which no intereference is caused.

As an experiment, the main series field of motor No. 1 was connected between armature and trolley. No. 1 motor then could be rotated in either direction with practically no interference; in fact, it was possible to rotate both motors simultaneously in either direction with practically no interference. It was concluded that in this type of motor either the main series field or commutating field will act as a choke, which prevents the commutator disturbances from reaching the trolley. It is impossible so to connect motors No. 1 and No. 3 with their main series fields between armature and trolley without adding another unit switch, because of the system of tapped field control employed.

Filter Reduces Noise

A new and more efficient filter was built and installed on the car. It was of a type similar to that already described except that it had three stages; that is, three 100-microhenry inductors

in series with the trolley lead and three 4-microfarad condensers connected respectively between the car end of the inductors and ground. This eliminated practically all noise from the main and compressor motors. It also was found that a large radio frequency choke (all three inductors in series) without any condensers was quite effective, but not as good as when the condensers were used.

It is to be regretted that a device such as described has practically no effect on the disturbance set up by a sparking trolley wheel. It is believed, however, that this is so small a factor that if the interference from the motors is eliminated, that from the trolley wheel will cause little or no trouble.

One effect noted has not as yet been clearly explained. There seems to be a certain amount of interference produced when the power is shut off and the brakes are set hard, though there is little or none while coasting and if the trolley pole is pulled down there is none at all.

The results of our tests indicated that most of the interference caused by an electric street railway could be eliminated by the proper use of a filter. Having reached this conclusion, one was designed for use on the cars, having in mind (1) effectiveness, (2) ruggedness, and (3) cost.

Details of the Filter

This filter consists of one high-frequency choke of approximately 100 microhenrys to be connected directly in the trolley circuit between the trolley base and the car wiring and bus, and a 2-microfarad condenser to be connected between the car side of the choke and the ground. The high-frequency choke consists of 21 turns of 1x0.083-in. copper ribbon wound in pancake form, with an inside diameter of 4 in. and an outside diameter of approximately 18 in. The turns were spaced ¼ in. apart with wood blocks or strip insulation.

Three cars were equipped with filters of this design. After a 90-day endurance run, one was put on special test. The tests, made at night when no other cars were on the line, consisted of comparing the intensity of the interference produced by the car with a filter and one identical to it except that it had no filter. The cars in question were run separately up and down the track past the observing point and for a distance of about two blocks on either side.

At the conclusion of these tests the management deemed it advisable to equip all of the active cars with this filter. We have received many letters from the radio fans thanking us for the work we have done.

Crossing Bells Also Offenders

After minimizing the interference caused by street cars, the next problem was the elimination of interference caused by wig-wag crossing bells. With a little study it was found that the bell itself caused considerable interference during the ringing period, and the contacts for the magnets that operate the moving disk caused little or none. Various types of filters were tried to wipe out this interference caused by the bell. By installing a small choke on either side of the contacts of the bell it was entirely eliminated. These chokes consist of 350 turns of No. 23 D.C.C. wire.

Railway Advertising Discussed

NEW ideas in railway and bus advertising were discussed by H. M. Lytle, W. H. Boyce and Maxwell Benson at the Public Utilities Advertising Association meeting held in connection with the International Advertising Association convention at Detroit, July 8-12. Mr. Benson gave a number of experiences and ideas used by the Nashville Railway & Light Company, of which he is advertising manager. He explained the use of mail circulation and how children may be appealed to for certain types of pleasure riding. He also explained how his company had recently co-operated with the theaters in Nashville in selling street car rides. A coupon was carried in the street car publication which, upon presentation to the theater box office, entitled the holder to a refund of his car fare both ways. The car fare was in the form of two street car tokens, the theater management standing the expense in return for the business they could get through the street car publication.

As a suggestion, Mr. Benson advised the use of car cards for popularizing, by the use of photographs, certain street car operators who had just performed some outstanding service. It would be a good medium for popularizing the individuals who had led in safety, courtesy or length of service, and also get over the idea that all other trainmen are trying for similar excellence.

In order to make motor coach routes better known, a contest is being conducted in Nashville whereby contestants are required to trace these routes onto a blank city map, and show familiarity with certain other details of the coaches and submit a brief essay on the advantages of using them. A number of business concerns along these motor coach routes are tied in with the contest and the company offered $50 to the winner.

In closing, Mr. Benson asked if it was insubordination for advertising men to ask for new equipment upon which to lavish their new ideas. How can a company expect to create new ideas when the company itself hasn't created a new street car in twenty years? Can the public be fooled into believing that it is more comfortable, more convenient, more pleasant to ride a street car that is two score years old, hasn't been washed in a month, and travels with the gyrations of a leaping Lena? Mr. Benson contends that every good advertising man should have the courage to help influence his company toward the purchase of as much new and modern equipment as possible so that he may have at least some substantial support for his sound advertising argument that a street car is much to be preferred to a private automobile.

Much interest was shown in the address by P. H. Gadsden, vice-president United Gas Improvement Company, Philadelphia, on "Great Industries That Advertising Has Built." Mr. Gadsden explained how advertising has been a stimulant to mass production and the important part that advertising has played in obtaining the present high standards of living and wages, and how it is a potent force in an alignment of business standards and practices. Mr. Gadsden emphasized the new competition which is threatening American business, in the form of an effort to inject the federal government into the field of business. He cited the harm that may come from such a situation and appealed to the advertising genius of America to meet and overcome this new competition by the same intelligent and sustained advertising efforts which have proved so successful in meeting each different kind of competition as it arose.

Work of Bureau of Simplified Practice Commended

IN A PAPER entitled "What to Buy, When to Buy, and Obsolete Material," read before the meeting of the California Electric Railway Association at San Francisco on May 7-8, 1928, C. Thorburn, purchasing agent Pacific Electric Railway of Los Angeles, commends the Bureau of Simplified Practices of the Department of Commerce for the results obtained in reducing and standardizing the repair and replacement parts in common use on electric railway properties. Not only does this cut down the number of items which must be kept in stock, but it also greatly simplifies and reduces the paper work necessary to properly keep track of it. Mr. Thorburn urges that the various departments in every company organization profit by this example in reducing the number of forms required in connection with records and accounting practice.

Attention is called in the paper to the prevailing tendency on the part of all users of material to distrust the stores and purchasing departments to the extent of drawing out more material than is actually required and caching it away for future use. To quote Mr. Thorburn: "Every department using material wants to have plenty of it on hand. It is hard to overcome a certain amount of distrust in the ability of the stores department to furnish material when and where wanted. To provide against the possibility of shortage, workmen and foremen alike, if afforded any kind of an opportunity, will draw an excess supply from the store, hiding it away in out-of-the-way places. Withdrawals of this sort beyond immediate requirements must be met by replacement in the stores department. Taking the entire system into consideration it will be seen that this practice soon leads to an over-accumulation, which is expensive even if the material is ultimately used as it suffers a certain amount of depreciation."

Home Rule Provision Drawn in Chicago

The home rule provision of the new transit ordinance which they are drafting was agreed upon, on July 31, by the members of the sub-committee of the Chicago City Council committee on local transportation. The provision is, in substance, the same as that contained in one of the Chicago bills which failed of passage in the Legislature last May. It would create a Cook County transit commission, four members of which would be named by the city and one member by the county board of commissioners. This commission would have the entire regulatory power over all electric railway and bus lines within the county and would supersede, in the county, the Illinois Commerce Commission.

The sub-committee desired that the City Council should not be removed from control over the commission, once the committee started to function. Assistant Corporation Counsel John G. Drennan was therefore instructed to insert in the new ordinance clauses strengthening the Council's supervision in this connection.

The sub-committee's meeting, held in the afternoon of July 31, followed a conference held in the morning of the same day with representatives of the Chicago transportation companies. It was in the morning that the Aldermen decided they had no definite program or policy on home rule. They determined to meet in the afternoon to formulate one.

Home rule is one of the four major parts of the transit ordinance to be agreed upon before details are discussed. The other three are consolidation, an amortization plan, and the length the franchise is to run which is to be awarded to the consolidated transportation company. It is expected that the question of the life of the grant will be the most difficult to determine. Some transportation executives insist on an indeterminate permit, but certain Aldermen believe that 30 years is long enough.

According to present plans the ordinance, if approved, will be submitted to a referendum in November. If it is approved, then, the Legislature will be asked next January to enact a bill under which it can be put into effect.

Certificates for First-Aid Courses in Georgia

First-aid certificates have been awarded to 112 members, including officials, of the Georgia Power Company, with headquarters in Atlanta, Ga., during the first six months of 1928. All persons, including two young women who received certificates, have completed the prescribed first-aid instruction courses and passed the necessary examinations. F. W. Hadley, safety director, announced the news.

Newark Project Discussed

Mr. O'Toole elucidates plan for relieving congestion in New Jersey metropolis. Fixes limitation of bus

"I FEEL that the project now before the people involving the Pennsylvania Railroad Station and the Morris Canal development is fraught with a great amount of potential value for our city. The greatest problem facing people today, is traffic. It is a question not peculiar to Newark. It is everywhere. Storekeepers find difficulty in getting people to come to their places of business. Why? Because of traffic. It clogs the streets. In Newark we are choked with traffic on our main business thoroughfares. We are strangled. Our growth is retarded. We are not able to develop as we should. We can't move people through the neck of the bottle as we should in downtown Newark."

Thus did John L. O'Toole, vice-president in charge of public relations of the Public Service Corporation of New Jersey, present this situation in remarks which he made at the recent dinner of the Newark Real Estate Board.

It will be recalled that the project to which Mr. O'Toole referred contemplates among other things a new terminal in Newark and the use of the abandoned canal bed by cars of the Public Service. In the improvement of the Morris Canal bed Mr. O'Toole said Public Service was not asking the city to give it anything. He described the proposed city railway and retold the story of where the trolley cars would enter and leave, location of the stations. He said:

It is a cold-blooded economic proposition. If some one has a better plan and if this plan is no good, all well and good. But if it is feasible and will take Newark out of the class of a two-street city and make it something more than a way station on the Pennsylvania Railroad, and make the city what it is—a real metropolis—what then?

Mr. O'Toole said Public Service had given serious consideration to using the canal bed for buses instead of railway. Figures compiled by the Public Service recently in a check-up of passengers using trolley cars and buses in "a peak" hour of the evening rush were then given in detail. Mr. O'Toole said the streets would not be able to accommodate buses if they were substituted for trolley cars, as there would have to be many more buses than cars to carry the crowds. [illegible] a bus every eight seconds. According to Mr. O'Toole it would be possible to dispatch 272 cars from the proposed terminal in an hour, but the handling of 453 buses in a similar period would be out of the question. He was quoted as follows:

The electric cars in Newark are still carrying the bulk of the traffic, the ratio being about seven to four. On the Springfield line, where the number of cars and buses is exactly the same, the cars carried 2,543 passengers and the buses 1,270. In South Orange Avenue, the car line with 41 units carried 2,532 passengers, and the buses with 43 units carried 1,670.

Rehearing Sought in Stockton

The city of Stockton has applied to the California Railroad Commission for a rehearing of its recent order granting an increase in rates to the Stockton Electric Railroad. The commission authorized the company to place in effect a one-way single cash fare of 7 cents between all points on the company's lines, and four tokens for 25 cents, unlimited as to time of use, each entitling the holder to one continuous ride with full transfer privileges. This was an increase over the former 6-cent fare. The commission suggested that the company place certain operating economies in effect and the city urges that this be done before granting the increased rates.

Advance Sought by Eastern Massachusetts Men

Trainmen of the Eastern Massachusetts Street Railway, Boston, were heard recently before the board of arbitration on the questions: Shall the basic wage be changed? Shall the differential to one-man car operators be revived? Shall seniority be established in the mechanical departments? The board consists of James J. Kerwin, Lowell; neutral member; Fred A. Cummings, vice-president of the road, and James H. Vahey, representing the men. Mr. Vahey cited the Boston Elevated scale of wages paid to carmen as contrasted with the similar scale of the Eastern Massachusetts rate. He contended the Eastern Massachusetts could afford to pay a higher wage.

North Shore Line Sells Air Transport Tickets

Chicago is made the hub of a new rail-air service with completion of arrangements by the Chicago North Shore & Milwaukee Railroad and the National Air Transport, Inc., whereby the North Shore Line becomes the exclusive agent for the sale of tickets in its territory for air transportation from Chicago to any of the cities served by planes of the N.A.T. Under this arrangement through rail-air service is established connecting Milwaukee, Racine and Kenosha, Wis., and Waukegan, Ill., served by the North Shore Line, and Toledo and Cleveland, Ohio; New York City, Moline, Ill., and St. Joseph and Kansas City, Mo., served by National Air Transport.

The Chicago Municipal Airport at Cicero Avenue and West 63rd Street is the point of transfer from rail to air. Passengers from Milwaukee or any of the other cities on the North Shore Line who purchase interline rail and air tickets travel by rail to 63rd Street, Chicago. There they can board a surface line car, which carries them directly to the hangars of the air transportation company. One trip is made each way daily over the eastern and western routes of the N.A.T. Trips between cities on this new air-rail service may be made in either direction.

Fares Increased in Springfield, Ill.

The Illinois Commerce Commission ruled on Aug. 1 to abolish the schedule of fares providing two tokens for 15 cents and eight tickets for 50 cents and to substitute a rate of three tickets for 25 cents on the lines of the Illinois Power Company in Springfield. The single cash fare remains at 10 cents. The commission did not, however, grant the plea of the company to charge a 5-cent fare for children. Instead, it increased the fare for children between the ages of six and twelve from 3 to 4 cents and allowed for a 5-cent fare for school children more than twelve years old. These new rates are to become effective Sept. 1, 1928.

In addition improved operating conditions and service were ordered.

The commission felt that to increase children's fares from 3 to 5 cents would so decrease that class of patronage as to reduce rather than increase the revenue from that class of car users.

In granting the increased rates, the commission declared that it would closely observe progress made by the petitioner to rehabilitate its trackage.

Salt Lake—a City Without Straphangers

Sixty-two men, under direction of Ross W. Harris, Madison, Wis., consulting engineer and traffic expert have been studying Salt Lake's street traffic movement since February, gathering information which will be used by Mr. Harris in working out some of the city's traffic problems. According to the Salt Lake *Tribune*, the indication is that the present signal cycle is too long for the most efficient speed in the movement of traffic. It should be shortened, decreasing the interruption. This would enable motor cars, street cars and pedestrians to move through the congested district faster. Mr. Harris is reported thus:

> At present, the time from green signal to green signal is 68 1/6 seconds. This time could be reduced with advantage. If 20 seconds were allowed for the green signal, four seconds for the amber signal, 20 seconds for the red signal and 4 seconds again for the amber signal, the cycle would be reduced to 48 seconds, which would be a reduction of 20 1/6 seconds.
>
> Under the present arrangement, the average speed of vehicles passing through Main Street and other busy streets is 15.95 m.p.h. With the change, the average speed could be increased to better than 22 m.p.h., which would mean a considerable aggregate saving of time for the users of the streets.

Examining into the parking problems of the central business district included in the area bounded by South Temple, Fourth South, West Temple and Second East streets, Mr. Harris found that the number of automobiles parked in the streets or within the blocks averages 4014. At 2 p. m., the daily average is 4373 and at 5 p. m., the average is 4256. Inquiry was made into the extent of vacant space within blocks, back of buildings, which could be used in parking cars. On this point he said:

> This unused area would provide parking space for 4152 automobiles. There would be another advantage than that of getting motor cars off the streets. The use of vacant space for parking would give buildings better fire protection.
>
> Merchants could offer their customers the use of the space. That idea has been adopted elsewhere. Or parking space could be rented at a nominal rate to automobile owners desiring to use it.

Mr. Harris declared that Salt Lake was remarkable in the number of persons who walk from their homes to the stores in the central district. Observations made by his staff, he said, show that 28 per cent of the shoppers walk to the stores in which they made purchases; 37 per cent rode in automobiles; 34 per cent rode in street cars, and 1 per cent made the trip in miscellaneous conveyances.

He thought that the reason so many Salt Lake shoppers walked to the downtown stores was due to the fact that the residential districts are conveniently located on all sides of the business center, making it easy for pedestrians to come from their homes. He also pointed to the fact that pedestrians, coming from residential districts, were not compelled to pass through such regions, existing in other cities, which persons afoot usually avoid.

Salt Lake is not a "straphanger" city, Mr. Harris found, after studying the city's street car service during the daily rush hours. He said:

> In the evening rush hours there are almost as many seats as passengers. The street cars here provide more seats during the rush hours than are provided for passengers during similar rush periods in other cities.

New San Fernando Line Would Cost $6,380,000

The cost of the proposed rapid transit interurban line from Los Angeles to San Fernando Valley, to which reference was made in the JOURNAL for March 3, has been estimated at $6,280,000 not including 30 bus feeder lines to cost $450,000. While cities in San Fernando Valley favor the proposed system, much opposition has arisen in Hollywood and other parts of Los Angeles where the proposed elevated line would run. Engineers of the Pacific Electric Railway have estimated the cost at slightly less than $6,000,000. The larger figure is the estimate of experts for the San Fernando Valley Association. Running time between Los Angeles and valley points would be cut in half by the new system, which would call for a few short tunnels in addition to the elevated line.

Seeks Postponement of Columbus Freight Issue

The Columbus Railway, Power & Light Company, Columbus, Ohio, has notified the Westerville village officials of its intention to ask the State Public Utilities Commission to postpone until Sept. 18 the hearing on the protest to abandonment of freight service to Westerville, 15 miles from Columbus. Charles C. Marshall, attorney for the company, suggested that it would be unnecessary for any parties desiring to oppose the application to appear at the hearing as the company intends merely to present its petition with proof of its publication and then seek postponement.

Westerville opponents of the railway are attempting to prove that the purpose of the postponement is to frustrate a possible referendum in Westerville at the November election on the bus-street car controversy. These protestants charge that should the railway be permitted to abandon the Westerville freight line, Westerville business men, who in the past have favored the company, would shift their support to the Buckeye Stages, Inc., which has been bargaining for the right.

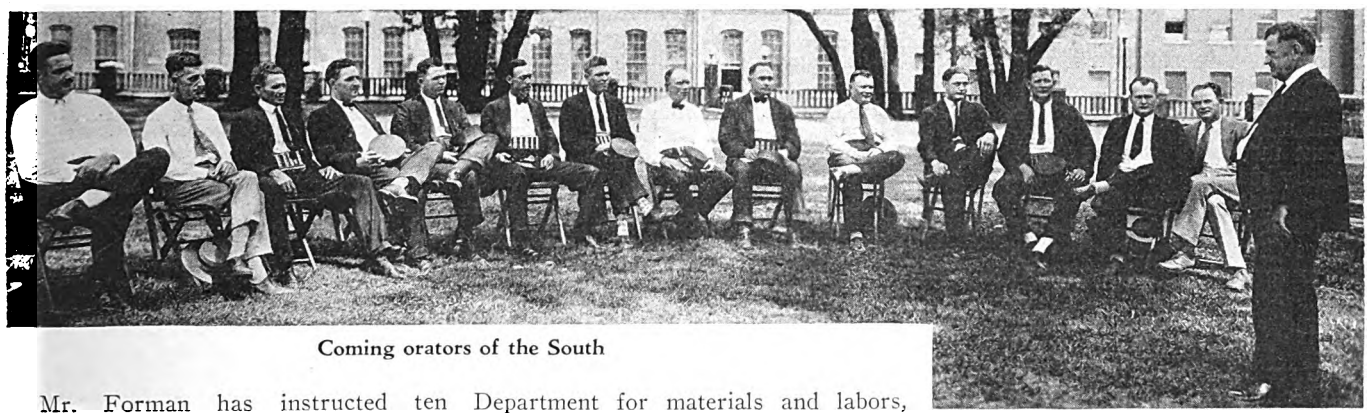
The Orator May Wear a Blue Uniform

The Jacksonville Traction Company, Jacksonville, Fla., has recently instituted a course in public speaking. Employees from every department enrolled under R. C. Forman, who has instructed classes in fourteen other companies under the executive management of Stone & Webster, Inc. Many of the Jacksonville trainmen and men and women connected in other departments have learned to talk capably in public—at least they have demonstrated considerable ability in their trial tests for platform presence and speaking ease.



Coming orators of the South

Mr. Forman has instructed ten classes in the local railway at Jacksonville, teaching the theories and fundamental principles by lectures and impressing them upon his pupils by actual practice. Mr. Forman is being relieved by Roy Minor, storekeeper for the company.

The public speaking classes have brought a new interest and diversion to many of the company's employees and have unearthed a considerable amount of oratorical talent, according to John P. Ingle, manager at Jacksonville, who said recently:

Many of our employees were astonished and gratified when they found that they could, with ease and force, address audiences. The instruction has been valuable to the company from a standpoint of improved spirit and awakened interest, but it has been infinitely more valuable to the individuals themselves. The confidence inspired and the ambition kindled by Mr. Forman's work may mark a turning point in several lives. When men and women become aware of powers they didn't suspect they possessed, they are likely to turn that knowledge to advantage.

Mr. Forman himself is delighted with the quick response of his Jacksonville classes. The keen interest and the earnest efforts of his classes to assimilate his teachings have been inspiring, the speaking instructor said.

Each of the classes is instructed in detail in theoretical phases of the work, and then put through easy stages to a point where speaking to an audience presents little difficulty. The students individually address the class bodies until confidence and poise are established. Officials of the company make brief talks before the classes.

"Don't be surprised," Mr. Ingle warned, "if some day in the near future the president of your club announces a name that is unfamiliar, unknown even to local fame, that has no ring of authority, and if a chap in a blue uniform takes the stand immediately thereafter to give you an insight into public service that you have never heretofore had."

State Courts to Hear Von Herberg Suit

The J. G. Von Herberg suit against the city of Seattle, Wash., initially instituted as the result of his purchase of approximately $125,000 in warrants of the Seattle Municipal Street Railway Department for materials and labors, since paid, will be tried in the state courts. The United States Court of Appeals at San Francisco said it had no jurisdiction. The railway department contended that further litigation will postpone needed betterments of the system.

The suit by Mr. Von Herberg was started in the Superior Court of King County. The Puget Sound Power & Light Company, drawn into the suit by the city, asked for removal of the suit to the Federal Court, and this was granted. Mr. Von Herberg appealed from the decision of the United States District Court at Seattle that the federal court had jurisdiction. During her term in office, Mayor Bertha K. Landes importuned Mr. Von Herberg to drop the litigation, contending that it was injuring the credit of the street railway department in the bond market. Although money was borrowed by the department from the city light and water departments, with which it paid the warrant Mr. Von Herberg had purchased, he has continued to seek a determination of the question of priority of operating warrants over funded debt obligations.

North Shore Accident Record Improved

In the annual report of the safety engineer of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., it is shown that the total number of employee accidents during the past year was reduced 11 per cent over 1926. There was a decrease of 12 per cent in the number of lost-time accidents, while the number of days lost because of disability was 28 per cent less than in the previous year.

Restrains Ohio Company

The village of Lowellville, Ohio, was granted a permanent injunction effective on Sept. 14, restraining the East End Traction Company from operating through that village. If the injunction goes into effect interurban cars between Newcastle, Pa., and Youngstown, Ohio, will be affected. The company's franchise expired in 1925. Contending that it was losing money the company sought to substitute hourly service for half-hour service. Residents of Lowellville urged their representatives to refuse to renew the franchise on that basis.

Seven Cents in Effect in Harrisburg

Patrons of the Harrisburg Railways, Harrisburg, Pa., started paying 7-cent fares on July 17 in all zones. The 30-day period of notice ended on that day without a formal protest to the commission. Fares to Hummelstown, Middletown and Linglestown are now 21 cents, in place of 18. Rockville and Oberlin rates are 14 cents. All other points may be reached on a 7-cent fare.

Since its organization the railway system of Harrisburg has increased fares only once, in 1918 when the 5-cent rate was advanced to 6 cents. The filing of the new tariff with the commission was referred to in ELECTRIC RAILWAY JOURNAL, issue of June 23, 1928, page 1044.

Accommodating the Summer Rider

Painting the ends of its trolley cars white is a recent advertising move of the Boston & Worcester Street Railway operating between Boston and Worcester, Mass. Officials say that the white coat of paint will attract riders and in giving the cars greater visibility will lower the possibility of accident.

The company has returned to the open car for the summer for the first time in four years. At present about half the cars running between Boston and Worcester are of the open type. The cars were remodeled from the old open cars, the running boards being removed and grating placed along the sides so that advantage could be taken of the front entrance feature.

Safety Poster Contest in Pittsburgh

Several thousand replies were turned in to the Pittsburgh Railways, Pittsburgh, Pa., in the recent safety poster contest, and twenty winners were awarded weekly passes. The contest called for a fitting title for a brilliant poster depicting a mother at a telephone and looking out of the window at an ambulance. The judges were all men actively engaged in safety work. Included in the titles were "The Toll Call" and "Beyond Recall." The purpose of the poster contest was to arouse individual interest in the campaign to save human life.

Fare Issue Argued in Los Angeles

Whether Los Angeles street-car patrons may continue to pay the present 5-cent fare or will be required to pay slightly more than 6 cents for tokens for one passage was the question placed on July 24 before the presiding United States Circuit Judge of San Francisco.

The arguments of counsel for the Los Angeles Railway and the State Railroad Commission, with the city of Los Angeles as intervener, were heard by three federal judges, Judge Hunt and United States District Judges Sawtelle and James. After extensive arguments, counsel rested with the privilege of submitting briefs and written argument within fourteen days.

Paul R. Watkins and Woodward M. Taylor of the firm of Gibson, Dun & Crutcher, representing the railway, said the company seeks interlocutory injunctive relief. Mr. Watkins said the order of the State Railroad Commission in denying an increase in fares and fixing the basis of the physical valuation of the company property at $42,000,000 is confiscatory. He said the company is losing $7,000 a day. He related that the late Henry E. Huntington had opposed a fare increase for patriotic and civic reasons, and hoped that another plan might be devised by which the company could be put on a paying basis. He said that various plans were proposed to bring the company out of its difficulties, but all were found not to be feasible.

The railway counsel said the basis of $42,000,000 gives the company a net profit of only 4.9 per cent on the investment, whereas if the basis were lower the company might benefit. Because of this, it was stated by counsel, the company's constitutional rights are being invaded.

Carl I. Wheat, counsel for the Railroad Commission, argued that the federal court has no jurisdiction in the matter. Assistant City Attorney Taylor, representing the city of Los Angeles, stated that, in effect, all of the various franchises granted the company are contracts and that their terms must be observed by either party except by permission of the Railroad Commission to do otherwise.

When the matter was submitted to the court, Mr. Watkins stated that he would like to see a table worked out by which the company could make 8 per cent on its investment. The court did not state when its decision would be rendered.

West Penn Employees Enter New Contest

Another prize essay competition has been announced in *West Penn Life*, the official paper of the employees of the West Penn Railways System. This time a prize of five shares of American Water Works & Electric Company, Inc., common stock is being offered for the best essay on the question, "How Does the Public Benefit from the Form of Group Management of the 'American Company'?"

The contest opened on July 15 and will close on Sept. 15. It is asked that every employee give the question of competing in the contest due consideration. A second and a third prize, consisting of two shares and one share of common stock respectively are offered. The rules of eligibility limit the essays to 1,000 words and require that the contestant's name be attached on a separate slip of paper.

In addition Monongahela System employees have been appraised of monthly awards of $5 for suggestions that are accepted where they effect better service to customer or economy in operation and $1 for suggestions accepted which provide improvements to property or safer operation but do not effect better service. In addition quarterly prizes and yearly prizes are to be awarded. First and second prizes are to be made in the nature of banners to be presented each Fall for "beautifying the property." Judges will inspect all property and proper ceremonies will be held.

Big Day in Connecticut Is Saturday

SATURDAY is the best day in the week for street car and motor bus travel and Sunday the worst, according to the records of the Connecticut Company. This situation obtains the year round, although, during the summer, the travel on Sundays, increases over that during the winter due to the riding to and from the shore and amusement resorts. The heavier traffic on Saturdays undoubtedly occurs by reason of the Saturday half holidays which give more opportunities for travel, for shopping and amusement purposes.

More than half of the entire number of passengers carried by the Connecticut Company each day ride between the hours of 6:30 and 8:30 a.m. and 4:30 and 6:30 p.m., and during these periods the company must furnish more than double the equipment used during the other hours of the day.

Politics Raises Its Head in Omaha

United States Senator Howell has demanded of the Council that before the formal passage of the new franchise ordinance in favor of the Omaha & Council Bluffs Street Railway the measure be amended so as to provide that as a consideration for the granting of a new franchise the company shall agree to sell its bridge connecting its two properties across the Missouri River at not more than $1,500,000. This is a toll bridge for vehicles and pedestrians.

President Shannahan says that negotiations of this character at this time would delay the submission of the ordinance beyond the election date. He said the company was willing to negotiate for making the bridge a one-toll structure or selling it, but not until after a franchise had been granted. Indications are that the Senator will find little support for his proposal, as the community leaders feel that his advocacy of municipal ownership is at the price of disrupting service.

Views on Cleveland Subway Aired at Meeting

The utilities committee of the City Council of Cleveland, Ohio, held its first meeting recently on the proposal made by Raymond T. Cragin, former president of the Cleveland Real Estate Board and promoter of the Cleveland Subway Company, to spend $30,000,000 on subways in Cleveland. Mr. Cragin told the committee that the subway company is ready to start work immediately, with money furnished by the Equitable Trust Company, New York, if the Council will give him a franchise and the Cleveland Railway will agree to operate the subways when completed at a fare sufficient to pay 6 per cent interest and amortization charges on a $30,000,000 bond issue. He took the attitude that he was making a proposition to the city and that it was up to the city to present the proposition officially to the railway.

City Manager William R. Hopkins told the committee the city had a perfect right to contract for a railway service on any basis it saw fit, but that the rub was whether the people would stand for it. Several Councilmen expressed doubt that they would be able to sell people in their districts the idea of paying an additional cent carfare to finance subway construction in a different part of the city. Mr. Cragin's answer to this was that a start had to be made somewhere, that subway operations in the downtown district would decrease operating costs in an amount equivalent to a half cent reduction in car fare; that an amount equivalent to one-third of a cent a ride would accumulate as a surplus out of the proposed 1 cent surcharge and that this surplus could be used at the direction of the city to build other subways.

The committee took no action. At later hearings the attitude of the Cleveland Railway probably will be sounded.

$1,861,003 Program for Seattle

Extension and reconstruction projects aggregating $1,861,003 are listed in a comprehensive rehabilitation program for the Seattle Municipal Railway, Seattle, Wash., disclosed by Roy E. Furse, acting superintendent of the railway. The projects include improvements in the existing facilities, new lines for which various localities have long been clamoring, reconstruction of existing tracks, installation of special work and paving between tracks. The report was prepared for presentation at the conference of city officials on plans for floating $4,000,000 or $5,000,000 in bonds to finance the work.

Purchase of 200 new one-man cars of the latest type is a feature of the program. Mr. Furse says these cars will soon pay for themselves in reduced operating costs and increased patronage. When the new cars are ready for service the present one-man cars will be used only as trippers.

Other items planned include new track work, at a cost of approximately $350,000; reconstruction projects, include paving between tracks, and reconstructing tracks at an estimated cost of $500,000.

After having been held in abeyance for more than five years because of the Municipal Street Railway System's inability to pay its share of the improvement, a $700,000 repaving project involving the Seattle business district probably will be carried through in the near future. The utilities committee of the Council has recommended that the work proceed since it has been indicated that contractors are now willing to accept street railway bonds for the railway system's share of the cost.

Buses in Alameda

The Key System Transit Company has asked the California Railroad Commission for permission to abandon all street car lines in the city of Alameda, Cal., with the exception of one line, No. 9, crossing the Park Street Bridge and running through Santa Clara Avenue. Bus service will replace the present car lines. The application will come up before Railroad Commissioner DeCoto, at a hearing that has been called for Aug. 14, to determine the routing of bus lines which the commission would authorize to replace street cars through the new tube under the estuary linking Alameda and Oakland.

Alfred J. Lundberg, president of the Key System Transit Company, said that even though the bus applications receive favorable action from the commission it is the intention of the company to ask the Alameda City Council for a revokable permit for the continuance of the Santa Clara Avenue car line from Webster Street to Park Street as an insurance against unforeseen contingencies in the estuary tube and also a guarantee of adequate transportation until such time as the company has sufficient experience behind it in caring for peak loads to the beaches by bus operation.

Cars and Cars

Discussion has turned lately to the question of the best method of opening street car and railway car windows. The proposals have varied from the advocacy of crowbars and dynamite to a counsel of dull dispair. The pessimist, figuring that the job is hopeless, has given up. His attitude is that you can't get a street car or a Pullman window open, and there's no need to try. Sometimes, by the use of a 25-cent piece bestowed on a practically athletic porter, a railroad coach window can be opened or closed. The undertaking is, in general, too serious and difficult to be worth the ambition. In the vote on the car window, the pessimists have it. But comments the Dayton *Journal:*

Meanwhile, in the United States there are running hither and thither something like 20,000,000 "cars" with windows which can be and are manipulated with ease by the weakest woman and the slightest child. A simple turn of a crank and the window in your automobile slips up or down. With a minimum of trouble, the air in the closed automobile can be closely controlled.

The automobile business is intensely competitive, with success dependent upon furnishing the purchasers of cars the utmost in comfort and doing it first. The first windows in the automobile sedan were as hard to manipulate as the windows in a railroad coach or street car. In their search for new attractions, the body builders thought of the windlass principle for their windows, and the automobile window is no problem at all.

The first automobiles were built high like buggies and street cars and Pullmans. They were built with hard cushions and high, straight-backed seats. In the competition for comfort between automobile makers the greater riding ease of the low-slung car was shortly discovered. Immediately, all automobiles began to hug the ground. It was discovered that low seats leaning well back increased comfort, and in this connection the cushion maker got busy. Seat cushions of such luscious yieldingness were designed as no king on a throne had ever dreamed of. Following all this came the "snubber" and a better science of springs, and today even the low-priced automobile has the ease and comfort of a cradle.

During all this time, what have the noncompetitive railroads and street cars been doing? For the most part, their patrons are riding on the same plush, and pitched at the same angle, and in cars of the same high altitude and wide oscillation which prevailed when the automobile was born. In street cars, the hard wooden or rattan seat is still in vogue. And neither railroad nor street car has bothered itself to invent and install a window that anybody but a giant with a crowbar can be sure of opening.

The street car business has been in hard lines since the war. The railroads have suffered also from automobile competition. We would not be hard on them. But suppose the street car and railroad people had been as progressive as the automobile people in the effort to make their patrons comfortable. Might there not be a different tale to tell?

Boston's Happy Result

IT IS evident that the trustees of the Boston Elevated Railway have been able to accomplish the happy result reflected in the recent statement of earnings at the close of their tenth year largely through the use of funds which may loosely be labelled "items hitherto held in suspense." But that does not reduce the credit due to them, and to Edward Dana, the general manager of the Elevated, for their remarkable work during the past twelve months. Although the company encountered last autumn, winter and spring a shrinkage in the volume of car-riding which cut $600,000 off gross revenue for 1928 as compared with 1927, the road was so prudently managed that $700,000 was saved in the expense account.

So the first ten years of the public control have come to a highly creditable conclusion. Only in the first year, under the 7 and the 8-cent fares, was a deficit incurred, and the loan of $3,980,157 then assessed against the cities and towns has now been drawn down to $1,349,333. In addition, nearly twice as much money is now annually paid out for labor as was paid before 1918, the stockholders have had their fixed schedule of dividends, and the car-riders have had the benefit of immensely improved rolling stock.—Boston *Transcript.*

Terminal Electrification Measure Proposed in Atlanta

Electrification of all railroads operating in the downtown section of Atlanta, Ga., is proposed in an ordinance drawn up by the bridge committe of the City Council.

The ordinance, if passed, will go into effect on Jan. 1, 1929. It states in its preamble that smoke and soot from the locomotives employed are injurious to health, to the stocks of merchants, to buildings in the vicinity of the railroad lines, and particularly to the bridges and viaducts over the railroad tracks, which must be frequently replaced because of corrosion resulting from the smoke menace.

The ordinance would make it unlawful after Jan. 1, 1929, for any locomotive to use bituminous coal within the city limits, or to "throw out from its stack any soot, smoke or cinders," or for the railroads operating in city limits to use any other than electric power for the hauling of passenger trains or freight trains.

Twenty-two out of 36 members of the City Council have signed the proposal as "favorable," which is considered to insure passage of the measure when it comes to a vote.

Recent Bus Developments

Bus Service Reported Satisfactory

Buses are being operated by the Evansville & Ohio Valley Railway on regular schedule between Evansville and Mount Vernon. Some months ago the company discontinued its railway service between Evansville and Henderson, Ky., and buses were installed and the company reports that the revenues from the buses have been quite satisfactory. The company continues to operate its railway line between Evansville and Grandview, Ind., but the operation of gasoline boats between Rockport and Owensboro, Ky., by the company has been discontinued and buses now are being operated between these two points to connect with the railway cars at Rockport.

Workmen of the railway have started the work of removing the company's tracks between Evansville, Ind., and Mount Vernon, Ind., following the installation of the new bus passenger service. The rails on this line were laid in June, 1905. Land comprising the right-of-way will be disposed of in various ways. Land that was secured by condemnation proceedings will in all probability revert to the original owners or their heirs. Land that was purchased outright will, of course, remain the property of the company.

New Service in Iowa

Interurban railway service between Cedar Rapids and Lisbon, over a route of about 17 miles, will be replaced with motor coach service operated by the Cedar Rapids & Iowa City Railway. This company discontinued the railway service on July 27 and will eventually remove 12 miles of this track. In addition to the new bus service the company is also operating a freight motor truck line to handle business which was handled in l.c.l. shipments by the railway. There has been no change of service nor is any contemplated on the company's railway line between Cedar Rapids and Iowa City.

Competition Threatens in Indiana

Arthur W. Brady, receiver for the Union Traction Company of Indiana, recently appeared before a representative of the Indiana Public Service Commission in Muncie and intimated that the company might petition for abandonment of its lines in Randolph County if the petition of the Greenville Transportation Company, seeking to establish intra-state bus service from Union City to Winchester, Ind., is granted.

In 1926 a similar petition to the commission was refused. At that time, however, it was sought to operate the bus line along a state road parallel to the railway. The bus company in its present petition seeks to operate over another state road which will be from a mile to 2 miles south of the railway.

The petition is opposed by the railway on grounds that adequate service is being maintained now by the company. According to Mr. Brady, the company is operating at a loss and if competition is increased the prospects are that the loss will become so great that the company will be compelled to abandon the line entirely.

Long Beach Service for Exposition

The Pacific Electric Railway has been granted a certificate of public convenience and necessity by the California Railroad Commission to operate auto stage service in the city of Long Beach temporarily during the period July 27 to Sept. 4, inclusive. This service is for the Pacific Southwest Exposition.

Hearings in New York Ended

Hearings on the application of the Equitable Coach Company for certificates of convenience and necessity to operate buses in Manhattan, Brooklyn and Queens were officially closed by the New York Transit Commission on Aug. 2 and attorneys of the company and of the Brooklyn-Manhattan Transit Company, New York Railways, New York & Harlem Railway and the Manhattan & Queens Traction Company, the four opposing railways, were ordered to submit briefs before Sept. 15. Meanwhile, however, the bus company must prove its financial responsibility to the commission.

Would Run Buses on Pennsylvania Line

The Lewisburg, Milton & Watsontown Passenger Railway, Harrisburg, Pa., has applied to the Public Service Commission for permission to abandon its line and substitute buses along the same route under the name of the West Branch Transit Company, most of whose stock is held by the electric railway. No protests were offered against the application.

No Bus-Trolley Competition on Buffalo Line

No opposition to the application of the International Railway, Buffalo, N. Y., for permission to abandon part of its Parkside-Kenmore line developed at the hearing before the Public Service Commission. Municipal authorities of the village of Kenmore appeared in favor of the plan. With the abandonment of its single track line in Kenmore Avenue from Virgil Avenue to Delaware Avenue, the International Railway now is constructing a loop at the Virgil Avenue city line of Buffalo. The Delaware Avenue bus will hereafter handle passenger traffic from the suburban village of Kenmore so there will be no bus-trolley competition on this route.

Intercompany Transaction in Newark

The Public Service Co-ordinated Transport, Newark, N. J., has been authorized by the Board of Public Utility Commissioners to issue $10,000,000 of two-year 6 per cent notes to the Public Service Corporation of New Jersey as evidence of advances of funds used in the purchase of bus equipment.

Another Suburban Bus Line at Worcester

Service by bus is now being maintained by the Worcester Consolidated Street Railway, Worcester, Mass., to Morningdale and Boylston. The railway line has been discontinued at the city line. Buses have gradually replaced most of the suburban trolley lines of the company, so that now the only ones remaining are the lines to West Auburn, North Grafton, Shrewsbury and Millbury.

Railways Capitalize on Zero Hour for Washington Buses

Following the heavy inroads into their traffic by buses operating over public highways, electric railway lines connecting Washington, D. C., with adjoining Virginian suburbs are getting back a large part of their patronage as the result of derangement of bus schedules due to road repairs. Both the Washington & Old Dominion and the Washington & Virginia Railways are putting on additional equipment and everything possible will be done to induce this patronage to remain permanent.

The bus lines sought to prevent the closing of the road, which is one of the principal arteries leading out of Washington, by means of an injunction restraining the state highway department from such action. The injunction, though obtained, was finally revoked by the justice who gave it. This opened the way for the highway department to blow up a bridge that is to be replaced. Highway officials believe that, inasmuch as the road is to be widened as quickly as possible, the work can be pushed more advantageously if the entire road is closed, rather than leaving alternate sides open for traffic. This attitude on the part of state officials was due principally to the fact that the existing electric railways operating over their own rights-of-way, would be able to serve the communities affected.

Financial and Corporate

Concluding Moves in Indianapolis-Cincinnati Deal

Control of the Indianapolis & Cincinnati Traction Company, Rushville, Ind., officially passed on July 27 from the receiver into the hands of Cincinnati and Toledo interests. The reorganization of the company, to be known as the Indianapolis & Southeastern Railroad, will be completed in a short time. C. T. DeHore, Cincinnati, is president of the company and also head of the Southeastern Indiana Power Company, an allied company which will sell electricity to the railway and to 28 communities served by the railway.

Mr. DeHore has announced that the main offices of the company will remain in Indianapolis. The new company has purchased ten new interurban cars of the one-man type to replace the large, heavy cars now in service. The company operates two interurban lines, one from Indianapolis to Greensburg and one from Indianapolis to Connersville. It is expected that the Indianapolis & Southeastern Railroad shortly will offer for public subscription an issue of $600,000 of 6 per cent preferred stock. The lines were constructed more than 25 years ago through the efforts of the late Charles Henry.

The company has been operating into Indianapolis over the lines of the Indianapolis Street Railway, but this right was denied the successor company on July 28, apparently because of an oversight in the negotiations connected with the work of winding up the affairs of the old company. In consequence a temporary bus service was installed to bring people into the city who used the interurban, but it is expected that this condition will soon be corrected.

Final Accounting for Massachusetts Road

Walter L. Adams, receiver for the Milford & Uxbridge Street Railway, Milford, Mass., has filed in the Supreme Court a report in which he states that for the quarter ended June 30, 1928, he had cash on hand totaling $165,205 designated as follows:

American Trust Company, received from the sale of the property plus interest, $87,630; American Trust Company, sale of the Holliston carhouse plus interest, $1,117; Old Colony Trust Company, sale of the Holliston carhouse plus interest, $32,642; Home National Bank, certificates of deposit $38,121; Home National Bank, received from the sale of Hopkinton rail and wire plus interest, $3,529; Home National Bank, checking account $2,163.

During the period of the receivership from Aug. 4, 1926, to May 3, 1928, inclusive, the total receipts were $306,129 and the total expense $287,182, leaving a balance of $18,947.

Mr. Adams reports that the road ceased to operate on May 3 when he deeded the property to the purchasers, the Citron-Byer Company, but that on May 4 the road was taken over by a new company, the Milford, Framingham, Hopedale & Uxbridge Street Railway, as the successor of the Citron-Byer Company. All bills contracted since the receivership have been paid except a bill of Professor Charles B. Breed for making a report on the condition and value of the property and apportioning of the lines between the two mortgages. Professor Breed has been paid in part but there may be a little more work to do.

Industrial Conditions Affect Operation in Beaver Valley

Gross revenues from railway operations of the Beaver Valley Traction Lines, New Brighton, Pa., were $552,950 in 1927, compared with $597,038 in 1926. The net deficit in 1927 was $9,325, compared with $8,044 in 1926. Passengers carried in 1927 numbered 11,424,960 against 11,984,996 in 1926. These figures do not include passengers carried free. The railway business was affected not only by the depression in many lines of industry with consequent unemployment, but also because of the continued abnormal situation in the coal mining industry. This was the explanation contained in the annual report of the Philadelphia Company, the parent company.

Bonds of the railway system in the principal amount of $486,000 were retired during the year from funds available with trustees derived from sales of property. Street railway expenditures were confined largely to improvements in track and roadway.

The Beaver Valley Motor Coach Company, the bus subsidiary, suffered a deficit of $10,725 for the year against a deficit of $4,654 in 1926. The number of bus passengers in 1927 was 1,176,900, compared with 1,084,811 in 1926.

CONSOLIDATED INCOME AND PROFIT AND LOSS OF THE BEAVER VALLEY TRACTION COMPANY AND PITTSBURGH & BEAVER STREET RAILWAY YEAR ENDED DEC. 31, 1927

Large Pennsylvania Merger Consummated

The East Penn Traction Company, which is a part of the East Penn Electric Company, serving a large portion of Pennsylvania, became a part of the extensive Pennsylvania Power & Light Company property on July 24. Announcement of the change was made by William H. Evans, manager of railways of the East Penn Electric Company. He will remain in that capacity, as will the remainder of the personnel.

The other officers, however, have been changed. They will be as follows: President, P. B. Sawyer, Allentown; vice-presidents, H. F. Dicke and E. W. Hill, Allentown; secretary, C. M. Walter, Allentown; assistant secretaries, H. L. Martin, L. K. Bingaman, S. M. Sweitzer, F. T. Carter, W. M. Brooks and E. P. Summerson, Allentown, and W. H. Evans, Pottsville; treasurer, C. M. Walters, Allentown; assistant treasurers, A. C. Ray, Alex Simpson, L. K. Bingaman, S. M. Sweitzer, F. T. Carter and W. M. Brooks, Allentown; auditor, W. L. Davis, Allentown; solicitor, Otto E. Farquhar, Pottsville.

The merger takes in all the trackage and equipment of the traction company and all subsidiary light and power companies in the Panther Creek Valley and coal regions. These are 35 in number. The cities affected will be Pottsville, Tamaqua, Ashland, Frackville, Minersville, Tremont, Williamstown, Lykens, Coaldale, Lansford, Summit Hill and Nesquehoning.

Lower Gross Income in Stockton

The Tidewater Southern Railway, Stockton, Cal., reports to the Railroad Commission its 1927 operating revenue at $332,229, compared with $316,030 for 1926. Operating expenses, excluding taxes for 1927, are $228,839, and $198,372 in 1926, leaving a net operating revenue of $103,390 for 1927, and $117,657 for 1926. During 1927 taxes charged to operation amounted to $30,696 and for 1926 to $24,306. Deducting the taxes leaves operating income of $72,694 for 1927, and $93,351 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, which represents the amount available for fixed charges, non-operating expenses, dividends and surplus of $75,923 for 1927, and $95,483 for the year previous.

Would Abandon Line in New York

An application was made by the New York State Railways to the Public Service Commission for consent to the abandonment of a portion of its route known as the Rochester & Sodus Bay Railway. The petitioner states that this 34-mile route, lying in the towns of Irondequoit, Penfield, Webster, Williamson, Ontario and Sodus is no longer necessary; that operations on this line have shown a constantly increasing deficit due to the automobile. The operating loss has increased from approximately $14,000 in 1922 to more than $47,000 in 1927. The total number of highway grade crossings on the line is approximately 57. Accidents are said to be frequent. The petition says that during the last five years a large number of serious accidents have occurred on this line.

Some Recent Income Statements

Figures of widely scattered companies reflect economic and industrial conditions in territories served

DECREASES in the net income for June and for the first half of 1928 as compared with the corresponding periods of last year are reported by the United Railways & Electric Company, Baltimore. The decrease in the net for June was $11,711 and that for the first six months reached $117,805. There was an increase of about 1½ per cent in the passenger revenue during June, but increases in wages and other operating expenses more than over-balanced this increase. During most of the six-month period the increased fare of 8⅓ cents was in effect. During the first half of 1927 the fare was 7½ cents.

STATEMENT OF EARNINGS AT BALTIMORE FOR SIX MONTHS

	1928	Increase
Passenger revenue	$8,117,353	†$5,692
Other revenue	106,714	†7,786

*Credit. †Decrease.

Note—Change in rates of fare, effective at midnight on Feb. 12, 1928, from 8 cents cash, with a 7½-cent ticket rate for adults and 4 cents for children to 9 cents cash, with an 8⅓-cent ticket rate for adults and 5 cents for children. No change in commutation or school ticket rates.

For the month of February revenues and expenses were for 29 days in 1928 as compared with 28 days in 1927. Expenses for 1928 are at increased wage over 1927, 2 per cent effective Jan. 1 and additional 2 per cent effective Feb. 12.

STATEMENT OF NET INCOME AT BALTIMORE BY MONTHS

	1928	Decrease
January	$18,367	$53,761
February	18,769	8,823
March	63,256	15,254
April	57,535	23,465
May	61,738	1,791
June	30,009	11,711
Totals	$229,674	$117,805

An increase of $12,247 in the earnings for the first six months of this year, compared with a similar period last year, is shown in the report rendered recently by the United Electric Railways, Providence, R. I. Both the operating revenue and the operating expenses for the first six months in 1928 showed a drop in comparison with a similar period in 1927. The net operating revenue for the 1928 period was $782,159. A net income of $288,608 was shown, an increase of 4.43 per cent over 1927.

The International Railway, Buffalo, N. Y., reports for the six months ended June 30 as follows:

	1928	1927
Operating revenue	$5,538,871	$5,423,725
Operation and taxes	4,637,947	4,901,174
Operating income	$900,924	$522,550
Non-operating	39,788	26,414
	$940,712	$548,964
Fixed charges	700,681	725,236
Net income	$240,031	*$176,271*

An amortization charge of $167,879 is included in the 1927 Buffalo statement. With approval of Public Service Commission this charge has been discontinued effective Jan. 1, 1928 and is therefore not included in the 1928 statement.

Gross earnings of the Market Street Railway, San Francisco, Cal., for the twelve months ended on June 30 were $9,858,135, against $9,875,516 in the previous year. Net earnings, including other income, and before provision for retirements, amounted to $1,515,380 against $1,835,986 in the previous year.

The Eastern Massachusetts Street Railway, Boston, Mass., reports June net income of $51,642 after depreciation and other charges, against $32,088 in June, 1927. The net income for first six months of 1928 was $542,647, compared with $465,209 in first half of 1927.

Net earnings of the Capital Traction Company, Washington, D. C., for the first six months in 1928, were $360,552, while net income for the first six months in 1927 was $390,034.

The Key System Transit Company, Oakland, Cal., reports for the six months ended June 30, 1928, net loss of $350,975 after charges against $204,872 in the similar period of 1927. The net loss for the month of June was $86,785 compared with $64,866 in June, 1927.

The Philadelphia Rapid Transit Company, Philadelphia, Pa., reports for six months ended June 30 surplus of $30,589 after fixed charges, dividends and

Digitized by Google

management fees, against $29,846 in first six months of 1927. The surplus for the June quarter was $15,618 after above charges, against $14,971 in preceding quarter and $14,342 in second quarter of previous year.

For the first half of 1928 operating revenue of the Denver Tramway, Denver, Col., was only $2,142,945 compared with $2,189,367, in the corresponding period of 1927. With 104,412 shares of preferred stock outstanding, second quarter earnings were $1.20 a share, while in the first quarter it was $1.12. The increment is attributed to a further reduction in operating expenses. A tabulated statement of the Denver Tramway and the Denver & Intermountain Railroad (the tramway's electrical freight railroad) with intercompany transactions eliminated for the first six months of 1928 follows:

Total operating revenue	$2,142,945
Less operating expenses and taxes—	
Operating expenses, including depreciation	1,417,089
Taxes	253,480
Total operating expenses and taxes	$1,670,569
Net operating income	$472,376
Total miscellaneous income	18,939
Gross income less operating expenses and taxes	$491,315
Deductions from Income—	
Interest on underlying bonds	$95,050
Balance	$396,265
Interest on general and refunding bonds	161,050
Balance	$235,215
Net profit and loss credit less amortization of discount on funded debt	6,993
Balance available for dividend requirements on 104,412 shares of preferred stock	$242,209

The Pacific Electric Railway, Los Angeles, Cal., reports a June operating deficit of $119,662, after expenses and taxes, and an operating deficit of $761,718 for the first half of 1928.

Hearing on Condemnation of Philadelphia Underliers

J. R. Morgan, counsel for the Thirteenth & Fifteenth Streets Passenger Railway Company, one of the underlying companies of the Philadelphia Rapid Transit Company, announced at the continued hearing before the Public Service Commission that his company would seek a court order to restrain the Mackey Administration from proceeding with its plan to condemn the underliers' holdings.

That declaration followed the commission's ruling at the outset of the hearing refusing the underliers' motion for dismissal of the city's petition for an appraisal of the underliers' holdings as an initial step toward ultimate purchase.

The case for both the city and the underliers has now been closed, but two weeks' respite has been allowed for opposing counsel to submit briefs and additional exhibits.

Owen J. Roberts, council for the largest group of underliers, took exception to the method employed by the commission's accountants in appraising the value of the underlier's stocks. He argued that the evaluation should be based on the price of the stock between 1896 and 1927, whereas the commission's experts computed the average price between 1917 and 1927.

$852,137 Carried Forward on Porto Rico Surplus

Net income from operations of the Porto Rico Railways Company, Ltd., San Juan, P. R., for the year ended Dec. 31, 1927, after providing for depreciation, was $407,685. This was disclosed in the annual report of the directors submitted at the 21st annual meeting of shareholders.

Interest on first mortgage and refunding mortgage bonds for the year absorbed $171,120. An appropriation of $50,000 has been made for United States income tax, including claims still subject to adjustment. After making the foregoing appropriation there remains a profit of $186,564, out of which have been paid dividends on preferred stock amounting to $70,000 and dividends on common stock amounting to $90,000. The balance of $26,564 has been added to surplus account.

There was appropriated from the surplus carried forward from the previous year the sum of $50,000 to provide additional reserve for United States income tax claims pending and $50,000 for additional depreciation applicable to the year 1926. The balance carried forward in surplus account at the close of the year amounts to $852,137.

The sum of $394,867 was expended on capital account during the year represented in part by the purchase of six modern type passenger cars and the erection of a new general office building.

The net working capital now amounts to $275,932, showing a decrease of $112,211 compared with the previous year, which is accounted for, according to President Killam, by the large expenditure on capital account.

CONSOLIDATED STATEMENT OF PROFIT AND LOSS OF THE PORTO RICO RAILWAYS

For Year Ended Dec. 31, 1927

Net profit from operation for year after providing for depreciation		$407,685

	100,000	
		825,572
Combined surplus carried forward		$852,137

Traffic Falls Off in Fort Wayne

The gross operating revenue of the Indiana Service Corporation, Fort Wayne, Ind., for the year 1927 was $4,459,215 compared with $4,345,946 in 1926. After deduction of operating expenses including retirement charges, bond interest and taxes, there remained a net income available for the payment of dividends of $433,830. Payment of dividends on the preferred and common stocks left the sum of $118,084, which was carried to the surplus account. These facts were contained in the annual report to the stockholders for the year ended Dec. 31, 1927.

Passengers carried on the company's city and interurban cars and motor coaches decreased 4.95 per cent from 1926. The number of revenue passengers carried on city divisions was 23,210,560 compared with 24,417,745 in 1926, while revenue traffic handled by the interurban lines decreased from 1,250,100 to 1,187,258 riders.

In an appendix to President Feustal's report is a chart showing passenger traffic since 1921. The story in figures is as follows:

1921	18,403,811
1922	20,805,562
1923	24,575,686
1924	25,327,227
1925	25,648,155
1926	25,667,845
1927	24,397,818

A general program of rehabilitation was carried on during the year on all the company's local and interurban railway lines. The improvements included reconditioning, reballasting, laying of new ties, rebuilding and double tracking.

There were 5,543 stockholders of record on the company's books at the close of the year, compared with 4,238 at the end of 1926, an increase of 1,305 or 30.8 per cent.

For the third consecutive year, the company presented to its employees as Christmas gifts a total of $1,227,900 in certificates of life insurance paid up for one year. Issued under a group policy, the certificates are given each Christmas to all employees who have been in the service of the company for six months or longer. Six hundred and ninety-four employees availed themselves of the privilege extended of subscribing for additional insurance at low group rates, the total thus subscribed for being $846,900.

Would Abandon 15-Mile Line in Maine

The Androscoggin & Kennebec Railway has petitioned the Public Utilities Commission for authority to abandon the 15-mile line operating between Augusta and Winthrop, Me., built in 1902. In the petition the company sets forth that a substantial sum could be realized from the salvage of the property devoted solely to operating the line; and that this sum would be materially reduced and finally lost through continued operation of the line.

Legal Notes

ALABAMA—*Authority of City to Permit Abandonment of Car Line Upheld.*

As the result of a proposed extensive system of rerouting recommended by a traffic expert engaged by the city, a company received permission from the city authorities to abandon a line. A bill for injunction brought by owners of property along the line against this abandonment was overruled. [B. E. Co. vs. Allen et al., 117 S.O., 199.]

ARKANSAS—*Operation of Car on Left-Hand Track, Because of Flood, Not Negligence.*

The mere fact that a street car was operated on the left-hand track across a bridge because the right-hand track could not be used on account of flood conditions was not negligence. It was the duty of the company, as well as its right, to operate its cars across the bridge for the convenience of the public. [Inter-City T. R. Co. vs. Worden, 6 S.W., (2d), 547.]

FEDERAL SUPREME COURT — *Tax on Gross Receipts of Transportation Companies, Not Applying to Individuals Conducting Same Kind of Business, Held Unconstitutional.*

The state of Pennsylvania taxes transportation companies doing business in that state at the rate of 8 mills per dollar of gross business received from passengers and freight traffic transported wholly within the state. This tax was assessed against a New Jersey Company, which conducted a taxi-cab business in Philadelphia. The company claimed that this tax was a violation of the equal protection clause of the 14th Amendment of the federal Constitution, as the same tax was not collected from individual taxi-cab owners doing like business. The Supreme Court held this amendment requires that any state tax classification must be based on real and substantial differences, having reasonable relation to the subject of the legislation. In this case, however, a tax on gross receipts was made to depend on the character of the owner, a purely arbitrary basis. The tax, therefore, cannot be sustained. [Quaker City Cab Co. vs. Commonwealth of Pennsylvania, 48 S. Ct., 553.]

INDIANA—*Generally, Street Railways Not Required to Warn Alighting Passengers of Obvious Danger From Automobiles.*

A statute requires motor vehicles passing street cars on the streets of any town or city to allow a lateral distance of not less than 20 ft. when the car has been stopped to permit passengers to alight. An able-bodied passenger, nineteen years old, and in full possession of his faculties, was injured by a passing automobile while he was descending from a one-man car at a regular stop. The company was held not responsible for neglect of the motorman to warn him of any danger, though the motorman saw the automobile approaching. [T. H., I. & E. E. Co. vs. Evans, 161 N.E., 671.]

MASSACHUSETTS—*Extended Discretion Given to Public Utility Commissioners in Grant and Revocation of Certificates*

A bus operator accepted a certificate from the State Department of Public Utilities permitting him to operate over a certain route, subject to various provisions and the right of the department to revoke his certificate after a notice and hearing. Later, the certificate was revoked because the operator had taken on and discharged passengers at prohibited points. The power of the commission to revoke the charter was upheld, the court saying: "The certificate was a privilege. It was neither a contract nor property, and its revocation deprived the petitioner of no vested rights. [Roberto vs. P. U. Commissioners, 160 N.E., 321.]

MINNESOTA—*Statute Requiring Certain Common Carriers to Obtain Certificates of Convenience and Necessity Upheld.*

A statute was passed prohibiting intrastate common carriers by motor vehicles from using highways unless they obtain certificates of convenience and necessity. The statute declared that its provisions should also apply to interstate commerce but only as may be permitted under the provisions of the Constitution and acts of Congress. Exceptions to the need for certificates were made of motor vehicles engaged exclusively in the transportation of children to or from school, those transporting farm products from point of production to the primary market, those delivering dairy products, freight carriers between contiguous municipalities, taxi cabs, and hotel buses. The constitutionality of the act was affirmed. A bus operator cannot claim exemption from the statute because he was operating his line at the time the statute was enacted, or to claim exemption as an interstate carrier, because he was carrying mail as well as passengers upon a federal aid highway at the time of its enactment. [State vs. Le Febvre, 219 N.W., 167.]

MISSOURI—*Responsibility of Company When Passenger Is Removed From Car.*

A passenger apparently asleep was shaken by a conductor, then, with the assistance of a police officer, was removed to the sidewalk. Before a patrol wagon which had been summoned to take him to a hospital had arrived, he died. The cause later was diagnosed as chronic nephritis. The company was held not responsible for any act of the police officer which was done wholly in his capacity as police officer and not at the defendant's direction, and the conductor and motorman were held not negligent. [Kirkpatrick et al. vs. Wells, 6 S.W. (2d), 591.]

NEW JERSEY—*Accident When Umbrella Obscured Vision of Pedestrian.*

A pedestrian crossing a street intersection during a rain storm with her umbrella in such a position that it obscured her vision in the direction from which a street car approached, was held guilty of contributary negligence as a matter of law. [Cady vs. T. & M. C. T. Co., 141 A, 806.]

NEW YORK—*Bus Line, Beginning and Ending in One State, but Passing Through Another, is an Interstate Carrier*

A bus line whose route begins and ends in one state, but between these termini passes through another state, is an interstate carrier. State statutes, which require a certificate of convenience and necessity and the consent of local authorities for intrastate lines, do not apply to it. [Garrison vs. Paramount Bus Corporation, 227 N. Y. Sup. 511.]

OHIO—*Right of Way at Street Intersection Defined*

Priority, or right of way, at street intersections does not mean the right to proceed uninterruptedly. It means a preference given to certain vehicles, but a preference which must be exercised with reasonable care. Thus, the driver of a vehicle not entitled to priority may properly assume that one who is will not approach the intersection at an excessive speed. [Presti vs. Cleveland R. Co., 160 N.E., 508.]

OHIO—*Misrepresentations Justify Cancellation of Operating Certificate*

Individuals claiming to represent a bus company received a certificate of public convenience and necessity, whereas on the date it was received, they had issued no capital stock and had no stockholders nor board of directors nor legally elected officers. When this fact was discovered, the commission was justified in recalling and cancelling the certificate. [C. & Z. T. Co. vs. P. U. Comm., 160 N.E., 458.]

PENNSYLVANIA — *Duty to Look and Listen Applies to all Occupants of Automobile.*

It is the duty of persons, when about to cross the tracks of a street railway, to look and listen for approaching cars and continue to do so until the track is safely crossed. Where an automobile contained three occupants, all engaged in the common business of salesmen, each occupant was charged with the negligent act of either of the others. [Griffiths vs. L. V. T. Co., 141 A., 300.]

Personal Items

Howard P. Savage With Marigold Coaches

Howard P. Savage, past national commander of the American Legion and formerly assistant general manager of the Chicago, North Shore & Milwaukee Railroad, has assumed his duties as general manager of the Marigold Motor Coach Lines comprising the Metropolitan System, with headquarters at 72 West Adams Street, Chicago. He succeeds Fred A. Klock, resigned. Marigold coaches operate over a network of routes to the north and west of Chicago. They connect suburban communities throughout the metropolitan area with the Chicago Loop, either directly or through the rail lines which they serve as feeders.

The appointment of Mr. Savage to this post comes after an extensive period of service in the electric railway transportation field. Following his gradution from Lewis Institute in Chicago and a course of study at the University of Wisconsin, he entered the service of the Chicago Rapid Transit Company in 1913 as a track foreman on the former Metropolitan West Side Elevated Railroad. He rose to the position of general superintendent of maintenance-of-way, in which capacity he was serving when he answered the call to the colors during the World War.

Overseas he served as an officer with the 55th Engineers, and on his return Mr. Savage resumed his duties with the "L" lines. He remained with the Rapid Transit organization until October, 1926, when he was appointed assistant general manager of the North Shore line. During the same month the American Legion conferred upon him its highest honor by electing him national commander at the Philadelphia convention. While serving as national executive of the veterans' organization, Mr. Savage led the "second A. E. F." to the Paris convention and on a good-will tour of Europe. He was actively engaged in his official duties with the North Shore line at the time of his recent appointment to his new post with Marigold Coaches.

William Fairlamb General Manager at Portsmouth, Va.

In order to promote closer co-operation between the company and the city of Portsmouth, Va., the Virginia Electric & Power Company has created the position of general manager of its properties in that city. To this post William Fairlamb, superintendent at Suffolk, Va., has been promoted.

E. H. Will, who has been assistant to Vice-President Thomas P. Walker, at Norfolk, Va., will succeed Mr. Fairlamb as superintedent at Suffolk.

George H. Smith recently resigned as sales manager at Portsmouth to become superintendent of the Norfolk-Portsmouth and Nansemond-Portsmouth bridges. He has been succeeded by Monteiro Nelson, assistant sales manager. George E. Schraudt, Jr. has been advanced to Mr. Nelson's place.

Mr. Fairlamb is a native of Richmond, a graduate in electrical engineering of Virginia Military Institute at Lexington, Va. He has been with the Westinghouse Company and was distributing engineer in Richmond before going to Suffolk.

Mr. Will is a graduate of Virginia Polytechnic Institute at Blacksburg, Va., and has been with the Virginia Electric & Power Company since 1922. He was formerly assistant electrical superintendent at Norfolk.

Changes in Providence Personnel

Alonzo R. Williams takes on duties of vice-president. Messrs. Lockhart, Anderson, Morris, Sjogren, Spencer, Thorsen and Hackett affected by change

THE duties of first vice-president of the United Electric Railways, Providence, R. I., were assumed on Aug. 1 by Alonzo R. Williams, who was elected to that position at a meeting of the directors on July 26. Mr. Williams, who has been general manager of the company since early in the current year, will also continue in that office.

A. R. Williams

In his new capacity, he will direct the details of operation which for a number of years have been in charge of President A. E. Potter. The appointment of Mr. Williams to take charge of the operation of the property resulted from a petition by Mr. Potter, who some time ago asked to be relieved of certain operating duties. Mr. Potter will continue as president of the company, a position he has held since Oct. 1, 1921.

In conjunction with the entering of General Manager Williams upon the duties of his new position a general reorganization of the transportation department of the United Electric Railways was effected Aug. 1. According to Mr. Williams the reorganization is expected to effect co-ordination in all departments.

Joseph A. Lockhart replaced R. Roscoe Anderson as superintendent of transportation. Mr. Lockhart has been with the company 25 years, and Mr. Anderson for 35 years. All matters pertaining to transportation upon the highways and relations between the transportation department and the street railways labor union will be in charge of Mr. Lockhart.

Harold G. Morris has been promoted to assistant to the general manager and will manage all organization and regulation in Mr. Williams' offices and will represent him in all departments of the company. Part of his time, also, will be given to constructive work. Mr. Morris, who for many years was secretary to President A. E. Potter, was made office manager with Mr. Williams last winter.

The vacancy caused by the promotion of Mr. Morris from his position as office manager will be filled by Arthur Sjogren, who has been in the office of the department.

The new department of Public Relations and Economics is headed by William B. Spencer, formerly assistant to the general manager. This department embraces matters of public relations formerly under the jurisdiction of Mr. Anderson and the department of Safety and Publication, discontinued a short time ago upon the resignation of the manager, H. K. Bennett.

Although his duties now will be more along constructive lines and in the further development of the transportation system instead of making new schedules, Hans. S. Thorsen will continue as supervisor of schedules for passenger service.

James A. Hackett, with the company, for 30 years, remains supervisor of traffic.

E. S. Lynes, property accountant and head of the fixed capital records department of the Georgia Power Company, Atlanta, Ga., has resigned to become affiliated with the Brazilian Traction Light & Power Company, São Paulo, Brazil, South America. He is to be plant accountant for the foreign utility, which operates in Brazil, Mexico and Spain, with home offices in Canada.

Pittsburgh's New Superintendent of Coach Transportation

Thomas Noonan chose discriminatingly when he selected Richard C. Gilmartin for the post of superintendent of motor coach transportation for the Pittsburgh Motor Coach Company in the recent rearrangement of the personnel of the Pittsburgh Railways, with which the coach company is affiliated. True, Mr. Gilmartin has been special coach representative of the company, but the holding of that position was in no way tantamount in itself to promotion to the important office this young official has been selected to fill.

Mr. Gilmartin has been in the post from which he was promoted for about a year and a half. If there is anything about the company's operation that he does not know, observers who have

R. C. Gilmartin

talked with him have not discovered it. The special coach representaive has had a lot to do. The Pittsburgh buses are popular, and Mr. Gilmartin as their special representative was fairly busy booking them to the best advantage, but not so busy that he did not absorb a lot of information about the coaches in regular service, their mechanical performance and their possible future.

The last was the thing that stirred his enthusiasm most. Sales were what he saw, for had he not served six years with the United Electric Light Company, to which he went from Duquesne University? It is with companies of that kind the selling instinct is kindled and so it was with Mr. Gilmartin. With such companies something new in sales is always in prospect, and the new superintendent of motor coach transportation absorbed a lot there which he put into practice in Pittsburgh, under the guiding hand of Mr. Noonan, general manager, than whom there is probably no abler merchandiser of transportation in the bus field, certainly among electric railways. The enthusiasm for the job was there on the part of Mr. Gilmartin. All Mr. Noonan had to do was to direct it a little. The report of the company for the year ended recently, made the subject of editorial comment in the JOURNAL for June 16, page 951, illustrates strikingly the achievements of Mr. Noonan, Mr. Gilmartin and the others concerned in the operation of the 60 vehicles now run by the company which conducts the Pittsburgh motor coach service.

W. J. Hagenah Joins Byllesby Management

W. J. Hagenah will join the Byllesby Engineering & Management Corporation as vice-president and special counsel on or before Sept. 1. Mr. Hagenah is one of the best known authorities on public utility valuations and rates in the United States. The firm of Hagenah & Dorsey will be dissolved as of Aug. 16.

John B. Tinnon Succeeds W. R. Hulbert With Thermit

John B. Tinnon has been appointed manager of sales of the Thermit department of the Metal & Thermit Corporation, New York, succeeding W. R. Hulbert, who has resigned to enter the firm of Thomas H. & Milan H. Hulbert in Chicago.

Mr. Tinnon was educated at Vanderbilt University. He entered the electric railway field in 1908 in the engineering department of the Chicago City Railway. He served as assistant engineer during the very extensive rehabilitation of the property and in 1912 was appointed engineer of way of the Chicago & Joliet Electric Railway, which position he occupied until 1918 when he served in the ordnance department of the U. S. Army. In 1919 he returned to the Chicago & Joliet Electric Railway as chief engineer. In 1924 he became connected with the Metal & Thermit Corporation as manager of the rail welding department.

Mr. Hulbert was graduated from Columbia University in 1904 with the degree of mechanical engineer. He was then connected in succession with the Power & Mining Machinery Company, the Rand Drill Company (now the Ingersoll-Rand Company) and the Kobbe Company, New York. While with the Kobbe company, he acted as managing editor of "Compressed Air," being published by that company at that time. In 1907 he entered the employ of the Goldschmidt Thermit Company as assistant engineer. When the Metal & Thermit Corporation was formed in 1916, he was made sales manager of the Thermit department.

A. C. DUGLE, auditor for the Indianapolis & Cincinnati Traction Company since 1922, with offices at Rushville, Ind., has resigned to become associated with the Lake Shore Electric Railway as traveling auditor with office in Sandusky, Ohio.

W. M. BERNETHY has been appointed assistant secretary of the Chicago, South Shore & South Bend Railroad, Michigan City, Ind. He has been associated with the railroad for more than fifteen years as a special accountant.

M. V. Robb Takes On New Utility Interests in Reading

Marshall V. Robb, the new owner of the Allentown & Reading Traction Company, with headquarters in Reading, Pa., is actively interested in utility development in Indiana and Kentucky. He was formerly connected with the Wabash Valley Electric Company at Clinton, Ind., and was a former vice-president of the Northern Indiana Power Company, the Indiana Electric Corporation and the Central Indiana Power Company.

Possessed of no technical education, Mr. Robb has applied himself wholeheartedly to the public service industry until now he has a practical knowledge of the business. He is, however, reticent on his plans and accomplishments. A native of Clinton, Ind., he

M. V. Robb

intends to move from Indianapolis, his present home, to reside in Reading, Pa.

The company in which Mr. Robb has purchased the controlling interest has been in operation since 1900. The story of its passing into new hands was told in ELECTRIC RAILWAY JOURNAL, issue of July 28, 1928, page 163.

A. R. Ireland and J. N. Breese in New Rôles

A. R. Ireland, assistant to the superintendent of employment of the Pacific Electric Railway, Los Angeles, Cal., has resigned to become connected with the Railway Mutual Building and Loan Association, a local railroad men's association, which has grown to more than a million dollar corporation in its first 20 months of operation.

J. N. Breese, who since 1918 has held various positions in the accounting, freight and transportation departments of the company, has succeeded Mr. Ireland.

RICHARD SUTRO, of Sutro Bros. & Company, New York investment bankers, has been elected a vice-president of the New York, Westchester & Boston Railway, operating a high-speed line out of New York City through Westchester.

Manufactures and the Markets

Changes in Westinghouse Air Western Office

C. J. Olmstead, western manager of the Westinghouse Air Brake Company at Chicago has been appointed assistant to the vice president. He will be succeeded by C. D. Foltz, who has been assistant western manager to Mr. Olmstead since 1926, and A. K. Hohmeyer has been appointed assistant western manager.

Mr. Olmstead came to the Westinghouse Air Brake Company in 1905 as commercial representative in the Chicago district office, after a connection with the Pullman Car Company of fifteen years. In 1912 he was appointed assistant western manager, and in the following year was appointed western district manager, which position he has held ever since.

C. D. Foltz joined the Westinghouse Air Brake organization in 1910 in the capacity of mechanical expert, located at Denver. Shortly after he was transferred to Salt Lake City. In 1920 he was appointed representative of the Westinghouse Air Brake Company at Salt Lake City, and in 1923 he was transferred to Denver in the same capacity. He remained in Denver until 1926 when he was promoted to the position of assistant western manager of the Western District in Chicago, which position he has held until his present appointment.

A. K. Hohmeyer came to the Westinghouse Air Brake Company in 1901 in the clerical department at Wilmerding. Here he was active in various positions until 1909 when he was transferred to the Chicago office. In 1913 he was appointed representative at that place, and he held that position until 1920 when he was appointed assistant western district manager. A year later he accepted a position with the Southern Wheel Company, which he occupied until recently, when he returned to his former field of activity with the Air Brake Company.

Texas Company to Take Certain Galena Properties

Agreement has been made for sale to the Texas Corporation of all outstanding capital stock of the Société Anonyme des Huiles Galena, France, and Galena Signal Oil Company of Ireland, as well as floating equipment of the Galena Navigation Company. Under this agreement the company will be paid for inventories and retain for its own account all cash, securities and net accounts receivable of the French and Irish companies.

The Texas Corporation also has offered to purchase certain other properties of the company and all major properties of the Galena Signal Oil Company of Texas, and its subsidiary Galena Pipe Line Company of Texas, plus their inventories. The proposal also involves sale of all outstanding capital stock of Galena Signal Oil Company Sociedade Anonima Argentina and Sociedade Anonyma de Oleo Galena-Signal Brazil on the same basis as the French and Irish companies.

The board of directors has approved the proposed transaction with the Texas Corporation.

Business in a Buying Age

Buyers know what they want and sellers must do business accordingly. The purchasing agent defended

G. A. RENARD, secretary-treasurer of the National Association of Purchasing Agents, in the New York *Times* recently discussed the status of the purchasing agent with particular reference to some of the criticisms which have been leveled at this increasingly important cog in the industrial and business world. He said in part:

To say, as has been charged, that the rank and file of purchasing agents, of which there are some 8,000 in the country, buying approximately $7,000,000,000 worth of merchandise annually, are responsible for demoralized market conditions is grossly unfair. In fact, this charge was definitely refuted at a recent conference attended by the executives of thirty leading industries which do a very large business with purchasing agents.

The thought developed at that conference was that if the question of overproduction is eliminated, such criticism of purchasing agents comes more from sellers who are not able to produce economically than from a real basis of complaint regarding unethical practices of buyers, and that for every so-called unethical practice of the latter many more could be cited against the sellers or their representatives.

For years the country was in a selling age. All the way from retailers to manufacturers the compelling urge was to sell, without a great deal of attention being paid to how to buy most efficiently. The explanation is that this stage was necessary in the country's expansion of business and industrial production. But through it all was the idea that business was like a horse trade—somebody was going to get skinned.

Now the business scene has been and is changing before our very eyes. We see it in many forms. In this change the purchasing agent has come forward and is now regarded as exercising one of the principal functions of management. He knows his firm's requirements thoroughly and his business is increasingly efficient because more and more he is buying as an engineer on specification and on the tests and reports of laboratories. His work is now centralized, whereas before his advent buying was haphazard and scattered.

The curious part of this situation is that many sellers have apparently been blind to these developments. They have tried to do business under old methods and with plants and production systems that are not economical and hence not in tune with today's conditions. When they found they could not do business on the old basis then the cry arose of demoralized markets and unethical, unsettling practices.

I recently heard two comments that I believe are apropos of the situation. One is that a large number of manufacturers have been playing "put and take"—but they have tried to make it all take and no put, as found by the Ninth International Cost Conference held in June. The other expressive of changed ideas is that the successful sales manager is no longer training his men to be "go-getters," but is now preaching the doctrine of "go and give service."

Today the science of purchasing is guided by four principles. These, in order of importance, are: Suitability of material to requirements, availability, reliance to be placed on seller's statements, and, finally, price. These standards, to say the least, are a far cry from those of ten or twenty years ago when buying was almost entirely done on price and sentiment.

While price has been placed last as a determining factor, it goes without saying that the purchasing agent must retain the right to select those with whom he does business. The buyer is just as much interested in a fair profit as the seller is, but

The Exhibits a School of Experience

IN PREVIOUS years Wednesday of convention week has been set aside for inspection of exhibits. This year a change has been made. Tuesday, Sept. 25, will be inspection day. There will be no convention sessions that day.

More than 100,000 sq.ft. of space in the Cleveland Auditorium group will be occupied by the A.E.R.A. exhibit. There will be on display the very latest offerings of the manufacturers for the more efficient and more economical operation and maintenance of service. It appears to President Stevens that none of us can be truly up-to-date unless the exhibits are inspected carefully and the manufacturers and their representatives are listened to attentively concerning the devices, equipment, and materials which they go to such expense and pains to put before the operating executives and their staffs.

As Mr. Stevens sees it, too much credit cannot be given the manufacturers for their enterprise and their co-operation with the industry and the association. His plea to executives is that they make a note of Tuesday, Sept. 25, as exhibit inspection day, and see that their engineers and maintenance superintendents and foremen are present in Cleveland on that day.

Digitized by Google

he cannot guarantee every seller a profit, since the seller and not the buyer determines the price at which the material is sold. It is not hard-boiled buying but weak-kneed selling that unsettles commodity markets, or as one prominent industrial editor puts it, "creates price cowardice."

The rush to gain volume has rendered profit margins slim in many lines and the seller must cut his costs if he is to stay in competition. I agree with the statement recently made by a well-known executive that "the one sure way to wreck American business is for buyers to guarantee a profit." To do so would remove all incentive for economic production. Still more strenuous competition lies ahead, with European nations beginning to regain their economic stability.

The trend toward mergers has featured business during the year and the results of these combinations undoubtedly will mean still more effective purchasing. They, however, do not necessarily mean lower margins for sellers of materials because it must also be considered that the sales cost to the seller is or should be correspondingly reduced.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

Metals—New York	July 31, 1928
Copper electrolytic, cents per lb	14.525
Copper wire, cents per lb	16.625
Lead, cents per lb	6.20
Zinc, cents per lb	6.55
Tin, Straits, cents per lb	47.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.15
Somerset mine run, f.o.b. mines, net tons	1.75
Pittsburgh mine run, Pittsburgh, net tons	1.70
Franklin, Ill., screenings, Chicago, net tons	1.58½
Central, Ill., screenings, Chicago, net tons	1.47½
Kansas screenings, Kansas City, net tons	2.25
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.3
Weatherproof wire base, N.Y., cents per lb.	17.125
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.3

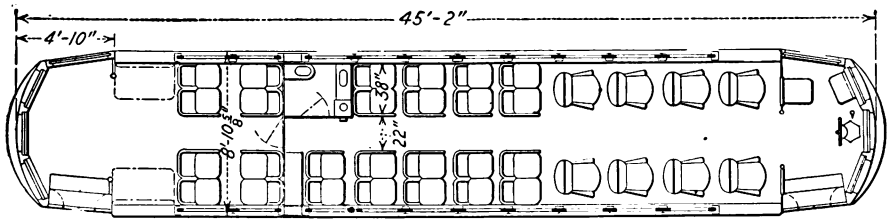
Turpentine (bbl. lots), N. Y., per gal	$0.58

Indianapolis and Southeastern Car Specifications

Ten cars are being built for the Indianapolis & Southeastern Railway, Indianapolis, Ind., by the Cincinnati Car Company, Winton Place, Ohio, as mentioned in the June 2 issue of this paper. These cars are of the one-man, motor, interurban, passenger type, seating 38 passengers.

The weight of these single-end double-truck cars is 38,000 lb. being 46 ft. 2 in. long and 8 ft. 10⅝ in. wide. The bodies are semi-steel with arch roofs and folding end doors. The cars will be equipped with duplex air-magnetic rail brakes similar to those tested recently on the railway's lines. Further details of the cars are given in the accompanying specifications.



Floor plan of the new cars being built for the Indianapolis & Southeastern Railway

Weights:	
Car body	16,340 lb.
Trucks	11,400 lb.
Equipment	10,260 lb.
Total	38,000 lb.
Bolster centers	26 ft. 10 in.
Length over all	46 ft. 2 in.
Length over body posts	35 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 10⅝ in.
Height, rail to trolley base	10 ft. 8½ in.
Window post spacing	33 in.
Body	Semi-steel
Roof	Arch
Doors	Folding, end
Air brakes	General Electric, straight with full safety feature
Armature bearings	Plain
Axles	Bethlehem open-hearth hammered
Car signal system	Consolidated
Conduit	Flexible
Control	K-75
Curtain fixtures	Railway Curtain Company
Curtain material	Pantasote, silk-lined
Destination signs	Keystone roller
Door mechanism	Consolidated
Doors	Folding
Energy saving device	Economy meter for one car
Fare boxes	Cleveland
Finish	Duco
Floor covering	Armstrong linoleum
Gears and pinions	General Electric, heat treated
Glass	Plate
Hand brakes	Cincinnati vertical aluminum wheel
Heat insulating material	Cork board and salamander
Heaters	Consolidated
Headlights	General Electric J-65
Headlining	Haskelite
Interior trim	American walnut
Journal bearings	Plain
Journal boxes	Cincinnati cast steel
Lamp fixtures	Dayton Manufacturing Company
Motors	GE-247I, outside hung
Painting scheme	Ten color combinations
Roof material	Wood, canvas covered
Safety car devices	Full safety car devices
Sash fixtures	Rex No. 24, ⅛ in. brass sash
Seats	H-K Model Pullman revolving chairs and 900-A double bucket
Seat spacing	33 in.
Seating material	Pennsylvania R.R. quality green plush
Slack adjusters	Cincinnati, turnbuckle type
Steps	Stationary
Step treads	Kass safety
Trolley retrievers	O-B No. 13119
Trolley base	Nuttal-Schweitzer
Trolley shoe	Miller
Trucks	Cincinnati cast steel side frame
Ventilators	Nichols-Lintern type "C"
Wheels, type	Carnegie rolled steel, 28 in. diameter
Wheelguards	Steel pilot

ROLLING STOCK

POTOMAC EDISON COMPANY, Hagerstown, Ind., has ordered four 21-passenger street car type Studebaker buses.

WINNIPEG ELECTRIC RAILWAY, Winnipeg, Manitoba, has accepted delivery of five Mack four-cylinder chassis, 196-in. wheelbase buses.

DALLAS RAILWAY & TERMINAL COMPANY, Dallas, Tex., has ordered seventeen Peter Witt type cars from the St. Louis Car Company. Mention of the plans to purchase these cars was made in the June 2 issue of the JOURNAL.

TRADE NOTES

THE ROLLER-SMITH COMPANY, New York, N. Y., announces the appointment of Elliott E. Van Cleef, 59 West Jackson Boulevard, Chicago, Ill., as its district sales agent in the Chicago territory. Michael B. Mathley, who has been connected with the Chicago office for many years, will be associated with Mr. Van Cleef.

LANG BODY COMPANY, Cleveland, Ohio, announces that the Economy Electric Devices Company, Chicago, Ill., is handling the street railway field for it and will be its representative in the central district. R. H. Newcomb, formerly with the New York, New Haven & Hartford Railroad, is handling the New England territory, with offices at 950 Tremont Building, Boston, Mass. A. H. Sisson, Grand Central Terminal Building, New York City, is representing the company in the New York district and the southern states.

ADVERTISING LITERATURE

PITTSBURGH TESTING LABORATORY, Pittsburgh, Pa., has issued a bulletin on inspecting creosote pine poles and piles. It contains a description of treating and inspection of poles and piles and the reasons for inspection of creosoted materials.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., announces a new 24-page pamphlet on electrical equipment for railway signaling. This booklet, designated by circular number 1787, covers a line of modern electrical equipment available for service in connection with the generation, transmission, control, protection, and maintenance of signal power.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has issued a new publication (DMF-5109) entitled "Some Reasons for Electrical Transmission on Self-Propelled Rail Cars."

EVERSHED & VIGNOLES, LTD., London, England, has published a 68-page booklet on insulation testing. This booklet covers the necessity for insulation testing, instruments used for that purpose, tests and their interpretation, practical applications, and some technical details of the megger and meg testing set.

LINK-BELT COMPANY, Chicago, Ill., has issued catalog No. 500 consisting of 1,088 pages and not only covers in engineering data and list prices of the companys' products, but contains considerable data for the engineer.

OXWELD ACETYLENE COMPANY, New York, N. Y., has issued a new catalog describing in detail the products manufactured by this concern, including welding and cutting equipment, and generators for the production of acetylene. The new items described are the type C-14 cutting blow pipe, the Carbic portable low-pressure acetylene generators, and the Carbic floodlights.

Volume 72 New York, Saturday, August 11, 1928 *Number 6*

Recognizing the Growing Importance of the Exhibit

FOR MANY YEARS the annual convention of the American Electric Railway Association has been the occasion for several feature services to the industry by ELECTRIC RAILWAY JOURNAL. First of these has been the annual Convention Number, published just before the convention and summarizing the high spots of the industry's thought and progress. Throughout the local transportation industry, the convention issue has come to be looked upon as sounding the keynote of the year's activity. It is not only read carefully, but is preserved by operating executives throughout the world.

More directly associated with the convention itself have been two additional journalistic services; the Annual Report Number and the Convention Dailies. The Report Number carries a complete summary of the speeches and proceedings of the American Association meetings, and of its several affiliated associations. It is mailed on the day following the close of the convention so as to be available for reference and discussion by the time most of the delegates reach their homes. The dailies are published on Monday, Tuesday, Wednesday and Thursday mornings during convention week. They give to those in attendance a day by day report of what is transpiring at the convention, changes in program, news of people in attendance—in fact, everything that a daily newspaper of the convention implies.

Despite this seemingly complete service, there has been a growing need for something more. During the past several years the exhibit of railway and bus equipment and apparatus has increased rapidly in size and importance. Recognition of the growing importance of the exhibit at this stage of the industry's development is evidenced by the practice started last year of opening the convention on Saturday instead of Monday, to give delegates more time for the inspection of this costly array of physical equipment. In the Convention dailies the JOURNAL has for many years endeavored to give attention to the exhibits but has been handicapped by physical limitations and the pressure for time incident to the publication of a daily.

To overcome this limitation and to give to the exhibit the space and attention which its importance demands this year the JOURNAL will devote its issue of Sept. 22 entirely to the convention exhibit. This is the opening day and the purpose of the issue will be to give an adequate presentation and interpretation of the apparatus exhibited by various manufacturers and of the progress made during the year in the improvement of physical equipment. It will endeavor to give a comprehensive picture of the exhibit, just as the Report Number gives a complete summary of the convention proceedings. It will be available to delegates at the convention on the opening day and will be a valuable guide in drawing their attention to those features of the exhibit in which they may be particularly interested. In addition it will be available for reference to these delegates when they get home, and will for the first time take to those transportation men throughout the world who are unable to attend the convention, an adequate presentation of the new and improved products shown at the exhibit.

Dodging the Real Issue in Boston

NO DISPARAGEMENT of the work of the Legislature of Massachusetts is intended by thus referring to its passage of the bill for the extension of the Boylston Street Subway under Governor Square at Boston, but that was really the least important of the three relief measures which the Governor had urged. The other two related to the question of the extension of a period of public control of the Boston Elevated, and of the expansion of that company's rapid transit lines. These issues apparently were linked inseparately. How the tremendous costs of rapid transit construction shall be met is also up for settlement in Chicago, Pittsburgh, Cleveland and St. Louis, all of which have subway systems in contemplation.

Saddling the costs of improvements of this kind on the car rider has limitations. Theoretically, the idea of making the consumer pay for what he gets is sound, but the consumer in this case is not the only one who benefits. In the Boston case it is a nice theoretical question, that of the extent to which the car rider would have to contribute to meet each year the carrying charges on $35,000,000 to $40,000,000 of capital if he were to bear them alone. There the way to the assessment plan has been cleared by the ruling of the State Supreme Court to the effect that betterment may be assessed in connection with rapid transit line extensions. That, of course, is the logical arrangement, but it is difficult to get legislators, even when they understand the economics of the situation, to accept the onus which goes with the advocacy of an arrangement of this kind.

There is a growing conviction among those who have intensively studied the problem of rapid transit financing, that a subsurface street for transportation is comparable to any other street improvement and that the property owner who benefits should meet his proper share of the expense of the improvement. However, the property owner is influential and has a direct selfish interest. Naturally he is opposed to assessment for rapid transit improvement if there is a chance to load the burden on the general community, or the car rider. He is unwittingly aided and abetted by the car rider, who is unorganized and frequently fails to understand the situation. General taxation is always tempting as the easiest method of financing transit costs, but fortunately for the future of some cities, there is an upper limit to their bonding power. There appears to be reason to believe that the

Digitized by Google

key to the Boston situation lies in the fact that though it understands the need and the justification for special assessment in the financing of new construction, the Legislature refuses to face that issue and prefers to "pass the buck" to whoever will accept it.

British Authorities Approve Standard Car

THAT fundamental ideas governing street car design in the British Isles do not differ greatly from those in this country is evidenced by the prize winning essay submitted by John F. Richards, rolling stock superintendent, Oldham Corporation Tramways, Oldham, England, at a recent meeting of the Municipal Tramway & Transport Association. Mr. Richards' ideal car could be set down in the average American city and found to be well adapted to the requirements of the riding public. It would meet with the approval of the maintenance engineers and shop force and would be readily acceptable by the trainmen who would have to run it. As a matter of fact there is scarcely a feature in Mr. Richards' ideal car, which, incidentally, exists only on paper, that has not already been incorporated into some of the cars actually built and in service in this country. The inference is plain that American designers at least are not deficient in original ideas.

Passenger comfort is paramount here as in England, but Mr. Richards gives this fact extra point by devoting a section of his paper to a discussion of comfort features viewed from the passenger's rather than from the engineer's standpoint. Individual upholstered seats, arranged in pairs facing forward, and with plenty of elbow and knee room are provided, while wide, clear-vision windows, soft lighting effects and ample but well-regulated ventilation, supplemented by electric fans, contribute to the restful effect.

From a mechanical and structural standpoint also, the British plan differs very little from the American, as exemplified in certain recent patterns. There is the same trend toward light weight and ample spring suspension of motors; the same preference for mechanical operation of doors, steps and sanding devices; the same effort to produce a vehicle of pleasing appearance. The influence of the automobile is to be noted in the recommendation of worm drive and internal expanding brakes. The importance of speed in loading and unloading is evidently appreciated in England, since the principle of the circulating load is incorporated.

The fact that Mr. Richards' article was awarded first place in a widely entered contest gives weight to the ideas proposed. They can be taken as representative of the most advanced British thought on the subject and additional emphasis is given to the principle of standardization in car design. In England, as in this country, the passion for individuality in design has cost the industry heavily in the past. It may flatter the pride of the local manager to have his new order of cars custom built but with fundamental specifications so generally agreed upon there is little excuse for this independence of spirit. Mass production of standard designs has placed the automobile industry in the first rank. This same principle has been extended to the manufacture of buses and if it could be applied to the production of street and interurban cars costs would be reduced and financing simplified. It will be interesting to watch the effect of Mr. Richards' suggestion upon forthcoming orders for rolling stock in the British Isles.

Not Mentioned in the Rules

COURTESY and politeness on the part of trainmen have long been recognized as attributes which will do much to further the comfort of patrons and increase the sale of transportation. But there are ways in which these qualities can be demonstrated that are not listed in the ordinary duties of the car operator. Witness the following incident:

A sudden severe thunder shower overtook the riders in a street car on a heavily-traveled line. The car was of an old type, with side seats and window sash which dropped into pockets in the sides. The male passengers struggled to close the windows and ventilators as best they could. Some of the windows, being of the well-known immovable type, refused to budge. From others the glass was missing, so that pulling up the sash was literally an empty gesture. The passengers drew the shades over such of them as would not close, although some of the fixtures were out of order and the curtains flapped in the wind, sprinkling water over a wider area than had they been left alone. Seats were wet, passengers had their clothing soaked, and confusion reigned.

Through all the storm the conductor paid not one bit of attention to the discomfiture of the passengers. He never moved from his position on the rear platform. His posture and appearance as he leaned against the railing were those of the corner loafer. Apparently he was content. Had he not discharged his entire responsibility when he saw the fares drop into the box!

Of course, it is not easy to make a definite statement that patronage has been lost by such an action. People in a large city have to ride. In fact, some of the passengers did not seem to appreciate that it was any part of the conductor's duty to look after the comfort of the passengers. That such a thing can happen on a car today, after all the talks and articles on the place of the operator—the company's salesman—does not speak any too well for the management. No matter how badly a company is off financially there can be no excuse for failure to perform tasks that, while out of the ordinary, are so obviously a part of the day's work that no rules should be needed to call them to the attention of the conductor.

Machine Accounting Offers Economy

VISITS to the accounting departments of several of the larger electric railways provoke the prophecy that the next few years will see an intensive development in office methods directed toward the substitution of machines for human labor. The development of equipment of this type is coming so fast that even the office appliance specialist is kept on the jump to remain abreast of affairs.

It is understood that five of the largest industrial concerns in the United States have established departments to function as laboratories for experimenting with better methods for handling office work. These organizations realize that specialization is essential to progress in any field. In the same sense, it is only natural to expect that on the larger electric railway properties, whose business involves the handling of freight as well as passengers, increased emphasis should be put on an office efficiency to match that of the operating and maintenance departments.

An outstanding example of the possibilities in mechanical appliances for the office is the recent reorganization

Digitized by Google

by a Western steam railroad of its division accounting system at a cost of approximately $80,000. Annual economies resulting from the modernized practices are said to be climbing above $40,000, with $50,000 as a not impossible goal. In other words, the cost of the new equipment is being offset by the savings of each two years or less.

Perhaps the biggest factor in the mechanization of office routine is the relation of machine cost to labor cost. The average life of an office machine is variously estimated at from eight to ten years. On this basis it would often pay to double the mechanical equipment of an office if even a relatively small saving in labor cost could be made. This is treating the problem solely from the point of view of economy without reference to the recognized mechanical advantages of speed, accuracy, thoroughness and legibility of records. The accounting offices of electric railways offer a prolific field for the use of modern machines in the interests of better service and increased net revenues.

More Liberal Car Purchase Terms in Prospect

SIGNIFICANT, indeed, is the promise of more liberal terms for financing the purchase of electric railway cars under the equipment trust arrangement. As the result of the work done by the American Electric Railway Association Committee on Electric Railway Finance, some of the car builders and manufacturers have expressed a willingness to liberalize the terms of payment for car purchases where the conditions are such as to warrant it. There also seems to be a prospect, at least, of ultimately interesting certain banking groups in the possibilities offered by the liberalization of credit terms to electric railways for car purchases.

Based upon its study of the situation, the finance committee has pointed out that the permanent improvement of the status of electric railways is dependent upon improving the character of their equipment. Convincing figures showing large savings in operating costs following the installation of new cars, to say nothing of their effect upon increased revenues, were contained in the report made last year by the association's special committee on the essential features of modern cars. Other statistics in the technical press, data collected by the manufacturers, and records of many operating companies, lend additional emphasis to the importance of car replacement as a means of improving electric railway earnings. All of these available data are cited by the finance committee in urging the need for more liberal terms of payment to permit cars to be purchased out of the savings which they would effect.

On many roads which properly deserve the extension of credit, new cars bought in lots of ten or more, with a down payment of 15 per cent, could pay their own way in actual savings during a period of ten years and leave an attractive margin to spare. But it is obviously impracticable to pay for cars on terms of 25 per cent down and five years for the balance, without credit resources beyond current earnings. Such credit it has been extremely difficult for many properties to get at advantageous rates. This has put badly needed new equipment beyond their reach. In view of that condition, the more liberal terms which are now apparently assured should make it possible for many railways with obsolete cars that now present a down-at-the-heels appearance to make the important move toward obtaining modern equipment. Accompanying the improvement in facilities and service thus offered the public, there is assurance of a very material saving in operating costs over and above the annual payments on the new cars.

What Is a Sound Economic Basis for Retiring Bus Equipment?

ACCOUNTING procedure among many transportation agencies has been complicated in recent years by the necessity of taking care of bus depreciation. The simplest plan is, of course, the so-called straight-line method. This contemplates an estimate of the probable useful life of the equipment, and the setting up of a yearly charge to meet the difference between the original cost and the amount, if any, retrieved when the equipment is scrapped. Where this period of probable useful life happens to correspond with the period in which the equipment becomes obsolete, the method is self-correcting, but if obsolescence, as it is known as an accounting term, intervenes before the expiration of the period of probable life—as it did far too often with the street car—things are thrown askew.

The early disposition among the railways was, perhaps, to write the bus equipment off too quickly. The art was changing fast, there was no reliable guide to the length of life of the new vehicle, and replacement at frequent intervals was considered likely. But even here there is a chance for honest differences of opinion. The idea expressed elsewhere in this issue by H. E. Jordan is that a detailed cost accounting system greatly reduces the necessity of the unsatisfactory guess work of estimating the "fair life" of a bus, since such a system gives a sound economic basis for the retirement of the equipment. He has reduced almost to a formula the basis for determining the economic life of the bus, or for that matter any other unit of equipment made up of a large number of parts, each of a different wearing life. As he sees it the matter is governed by the point in the life of the major units where the difference in cost of maintenance between the old unit and the new unit, less the difference in the rate of depreciation, is equal to the interest on the new investment, namely, the cost of the new unit. As the author says, it is very probable that before the peak of the maintenance curve is reached, the higher cost of maintaining and operating the old bus over that of a new bus will justify its replacement.

The term "fair life" is, of course, not easy to define. As for obsolescence, two competent and experienced parties might disagree on the time a bus is obsolete and yet both might have sound reasons for their respective viewpoints. Only recently a large railway decided that it had not judged correctly the fair life of its buses. It had not been sufficiently optimistic and it said so. Another company operating 40 vehicles is charging about 10 per cent of the cost of its vehicles to depreciation, or an amount that approximated 12½ per cent of the total earnings last year.

Certainly, obsolescence is not the likely factor that it once was in the proper accounting of these vehicles, but that is no reason for repeating the policy so many companies did with the street car of thinking that a car was properly a car simply because it was possible to keep it in service. Too many railways made that mistake. That the disposition among them is not to make the same mistake now about the bus is distinctly to the credit of the railways even though at first thought that disposition may appear to militate against the bus.

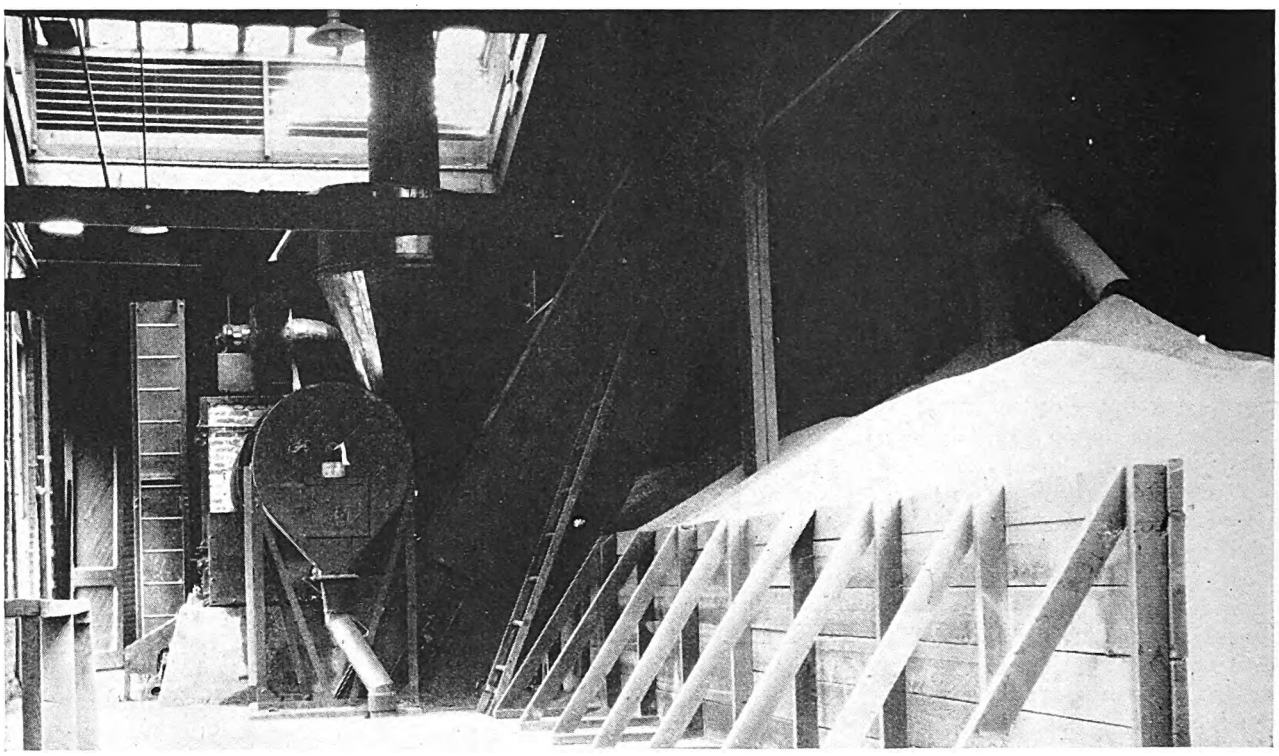
Pittsburgh Builds Modern Sand Drying Plant

By Newton E. Tucker
Way and Structures Division Pittsburgh Railways,
Pittsburgh, Pa.



General view of the Pittsburgh Railways' new sand drying plant. The dryer drum and the wet sand conveyor are on the left and the bin for the dry sand is on the right

Revolving drum dryer has a rated hourly capacity of 7 tons of sand having an initial moisture content of 6 per cent. Gas-fired heating oven is thermostatically controlled

SANDING is the most effective way of counteracting slippery rail and insuring the safety of everyone using streets on which electric cars are operated. Sand must, however, be dry and flow freely the instant the motorman touches his levers. With a yearly cost of approximately $40,000 for furnishing dry sand, half of which was for labor, the Pittsburgh Railways recently determined to modernize its sand drying methods.

The climate and topography of the Pittsburgh district require the use of more sand than is used in the majority of the cities of this country. There are many steep grades in the city and surrounding boroughs located in the foothills of the Allegheny Mountains. The grades vary from a quarter of a mile to 1½ miles in length, with slopes from 3 per cent to 7 per cent, and many sharp, dangerous curves. Winter brings numerous snow storms, seldom very heavy, but occurring almost daily. Last winter there was a freeze and thaw cycle every four to seven days. In the summer, too, sand must be used frequently, for soot from nearby mills and factories is mixed with frequent light rains and is tracked onto the rails by automobiles.

In the past the sand was supplied by drying stoves. These stoves were built of two steel cone shells, one within the other. Wet sand was shoveled by hand into the space between the two cones. A coal fire was kept within the inner shell for evaporating the moisture. When the sand dried it fell through holes punched in the outer cone. The system was supplied by twenty-four of these stoves located at fourteen different carhouses. One man operated two stoves, all the sand being supplied by hand.

With these scattered facilities it was difficult to obtain low prices for sand. Each district supervisor ordered the sand from the company most conveniently situated in his particular locality. In nearly all instances the cost of unloading by hand was from 10 cents to 15 cents a ton higher than dumping rates.

In November, 1927, a new machine built by the L. R. Christie Company of Pittsburgh was installed. This has a horizontal cylinder or drum, about 3 ft. in diameter and 20 ft. long. A kind of radiator tube in the shape of a cross is located in the center of the drum, full

Digitized by Google

length, and batten plates are fastened along the sides of the outer shell. One end is inclosed with a screen and hopper, while the other end rotates in a brick, gas-fired oven. The sand enters the drum at the furnace end and is pushed down through the dryer by means of the batten plates and the slightly inclined angle at which the machine is set. While moving along to the discharge end, the sand becomes loosened and scatters through the hot gases and onto the center radiator tube. The screen prevents any large pebbles or sticks from going with the sand and shoots them down a pipe to a waiting flat car.

The oven is fired by six surface combustion high-pressure tile gas burners. The hot gases are mixed with about 200 per cent excess of air and are sucked through the dryer by a centrifugal fan. They enter the inner tube or radiator at the loading end, pass from the tube to the outer sand chamber at the discharge end, and are redrawn through the falling sand to be discharged to the atmosphere through the fan and dust catcher. Most of the moisture in the sand is evaporated when it comes in contact with the inner tube.

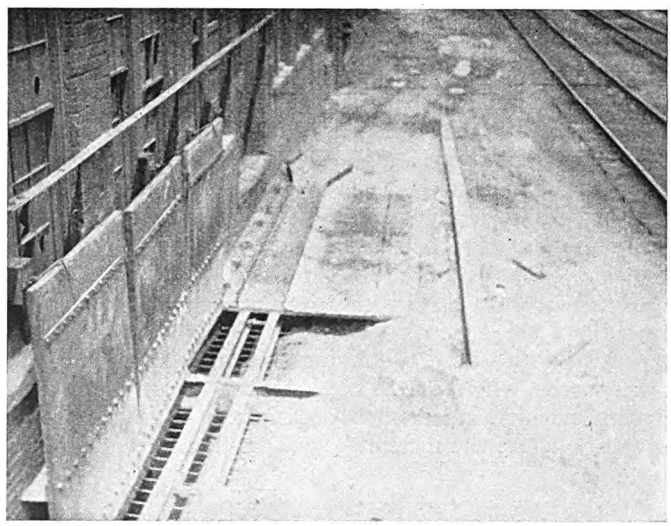
Temperatures of the gases as they pass into the outer sand chamber are greatly reduced so that overheating of the sand as it discharges is held at a minimum. This further tends to keep the moist steam away from the discharge end of the drum, preventing any possible after-mixing should the gases become oversaturated.

Control of the amount of gas required to dry sands of varying moisture content is obtained by a Bristol electric thermostat. The sensitive bulb of the thermostat is located in the path of the moist gases just before they enter the blower housing. This bulb is connected to a temperature indicator which in turn operates a solenoid valve on the gas line. By experimentation, a temperature of 190 deg. Fahrenheit at that point of the passage was found to be sufficient to carry away all the moisture without allowing it to condense in the dust catcher.

If the drum should stop rotating, the gas would automatically burn more slowly as the temperature rises in the chamber. An extra precaution against overheating the brick oven and cylinder shell is taken care of by connecting the solenoid in parallel with the motor that operates the wet sand elevator. If for any reason this motor should stop, the gas is immediately shut off. It is further evident that this thermostatic arrangement insures efficient economy of gas with practically no attention from the operator.

The necessity for reducing labor as much as possible in handling the sand made necessary careful layout and designs of storage and conveying machinery. The old sand room of the Rankin carhouse was chosen because of its convenient location near a source of supply. In back of the carhouse the ground is 13 ft. higher than the track floor inside of the building. The old sand drying stoves formerly stood on a second floor located in this portion of the building. Holes were cut in the walls and chutes were made to slide the sand into a 50-ton bin on the track floor. To get a desirable slope to the chutes, it was necessary to build a ramp 2 or 3 ft. high on which the trucks back up to dump. The doors covering the chutes were reinforced with I-beams so that the truck could back over them to the empty portion of the bins.

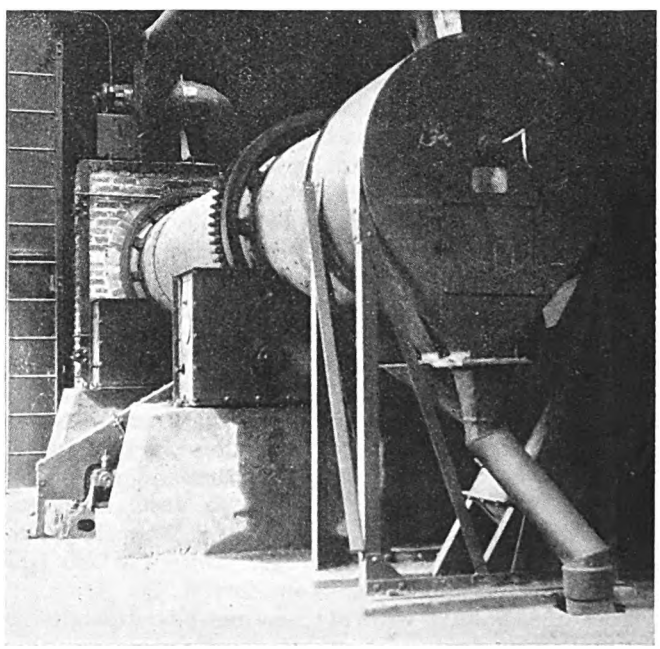
The wet sand falls out through openings in the bottom of the bin onto a conveyor belt. Six especially designed sliding gates on roller bearing wheels close and open the holes as desired. Above each gate, small poke holes



Ramp, chute and covers where wet sand is dumped from motor trucks

were cut out to break up any arching effect of the wet sand over the opening. This arching characteristic of wet sand was considered carefully in the design of the bin, but it has been found necessary to station a man to watch the conveyor almost continually in order to break up the arch when the sand stops running.

The conveyor belt is propelled by a three-speed motor so that by varying the speed of the belt, the rate of feeding can be controlled according to the wetness of the sand. A vertical conveyor lifts the wet sand up to the roof where it then falls through a pipe to the drying machine. Another vertical conveyor carries the dry sand from the discharge hopper to the ceiling, where it falls through spouts to the storage area of the floor. Holes were cut through the storage floor, and chutes with gates were attached for loading the cars on the track floor below. Electrical switches controlling the motors for the fan, drum and all conveyors, are interconnected, so that if any motor in the line should stop, all motors on



Closer view of the dryer drum and oven wall. The drum is lined with batten plates and tilted slightly to aid in moving the sand through its length

Digitized by Google

preceding operations would automatically shut off, preventing any dangerous overcrowding of the crippled unit.

The dryer has a rated hourly capacity of drying 7 tons of sand having an initial moisture content of 6 per cent. Practically all the sand used around Pittsburgh is dredged out of the river and delivered with upwards of 10 per cent moisture. The capacity of the fan to draw only a definite amount of hot gases through the drum limits the output to between 4 and 6 tons per hour when the sand contains more moisture than 6 per cent. It is unfortunate that during wet or icy weather when rail conditions are exceptionally bad, the sand is delivered saturated with water, containing frozen pieces of ice. In other words, when sand is needed most, the output of the drying machine is least. It occasionally is found necessary to operate the machine overtime due to this inverse ratio of operating conditions. An extra large storage for the dry sand helps to prevent overtime operating expenses.

Labor costs for the actual drying work have been greatly reduced. Where, heretofore twelve men were required the work is now being done with four men. Two operators are required on the machine and two of the old plants are still being operated to take care of peak loads and emergencies. This saving of labor is somewhat offset by the cost of transporting the dry sand about the system. Running time to the various carhouses is anywhere from 30 minutes to 1½ hours. Gondola cars are used mostly, requiring two men to operate them. Unloading at the storage bins of the carhouses is done by hand and takes about two hours. It would be liberal to estimate an average transportation cost of 60 cents per ton. A tank sand car is now under construction that will unload by means of compressed air. One or two large automatically controlled storage bins will be built at strategic points to do away with all the small sand houses, which will cut the transportation costs considerably.

Cost of dry sand with the new machine amounts to about 60 cents a ton. Transportation costs increase this item to about $1.20 per ton to make conditions comparable to the old stove drying system. The drying costs can be divided in per ton units as follows: 8 cents for 150 cu.ft. of gas at 5 cents per 100; 26 cents for labor of two men, at about $3,000 per year, drying 11,000 tons; 23 cents for interest, taxes and depreciation at 20 per cent of $14,028, the cost of the dryer and auxiliary equipment; and 3 cents for power at 1.5 cents per kilowatt. Records of cost by the old stove system averaged about $1.81 per ton. The entire cost of plant with building alteration and extras amounted to about $17,500. With a saving, as shown, of 61 cents a ton on a yearly quantity of 11,000 tons used, the total saving would be $6,710 per year. It would therefore take about 2½ years to pay for the plant.

There are many other advantages, however. More favorable purchasing contracts can be made as one sand company will bid on the entire quantity and make allowances for dumping. Automatic controls and conveying machinery get highest efficiency from fuel and energy, which makes for a more uniform dryness. Concentration of floor space makes available additional car storage areas at the various carhouses. Handling of coal and ashes is eliminated along with the smoke nuisance that was associated with the old stoves. In brief, the company is well satisfied with the sand drying machine.

Wet sand bin with a capacity of 50 tons, located on the ground floor

Work Cards Promote Efficiency

EACH carhouse mechanic on the system of the Los Angeles Railway is furnished a "Work Card" on which he sets down the time, correct to the nearest five minutes, which is spent on each separate job to which he is assigned during the day, the time being segregated by numbers into various major accounts. The foreman or anyone acting in a supervisory capacity may ask a mechanic for his work card at any time and learn from it exactly what he has done that day and how long it took him to do it. The work cards are turned into the foreman's office at the conclusion of the working day and are used in preparing the accounts. It has been found that the psychological effect upon the workman of recording the time required to perform a definite piece of work tends to improve efficiency, as the men take pride in doing the work in the shortest possible time.

Keeping Proper

Bus Depreciation Accounts

Detailed cost accounting eliminates the unsatisfactory estimating, or rather guessing, of the "fair life" of a bus and gives a sound economic basis for retiring equipment

By H. E. Jordan

Assistant Engineer Los Angeles Railway, Los Angeles, Cal.

BUS expenses are classified as transportation, fuel and lubrication, maintenance, general administrative expense and depreciation. The wages of the drivers and conductors, the cost of fuel, the cost of repairs, and the general administrative costs are expenses that may definitely be summed up at the end of any month, and any item included in that summary may be traced down to the purchase of a definite amount of material, the efforts of an individual, or the specific items of taxes and insurance. However, bus depreciation, which averages between 20 and 25 per cent of the total operating cost, is not definite.

Few operating companies have a detailed cost accounting system that is sufficiently complete to enable them to make a thorough analysis of their operations. When an analysis is attempted, usually the mechanical superintendent and the master mechanic are the first to be "hauled upon the carpet," and sundry proposals are made whereby the maintenance may be reduced. To be sure, this may offer many possibilities for increased economies. However, the net savings effected from proposed changes pertaining to the maintenance of the buses is seldom satisfying because the cost accounting system has not been developed to show accurately the resultant cost reduction, if any has been obtained. Since the total maintenance cost, exclusive of tires, is approximately 10 per cent of the total operating cost per bus-mile, a relatively large reduction in maintenance could only make a small reduction in the total expense.

Several Accounts Offer Cost Reduction Possibilities

The fuel and lubricating accounts are not considered to the extent they deserve. They represent about 9 per cent of the total operating cost and there should be many possibilities in them for reducing costs. Gasoline motors, driving gears and other units in buses have been developed to a high degree, but there should be opportunities for further improvements in their design that would lower the fuel consumption and the amount of lubrication necessary.

Operators' wages and other transportation expenses, approximately 31 per cent of the total, are not considered, as buses must have drivers and the rate of pay is not very flexible. The transportation expenses, therefore, are usually considered as inflexible charges and given little consideration in a study for cost reduction, unless the service is to be reduced. A reduction in service is seldom made as there is almost always a demand for not only bigger buses, but also more of them.

Insurance, taxes and general administrative expenses are also regarded as inflexible charges. Finally, the management in its analysis of expenses arrives at the equipment depreciation account. It represents approximately 23 per cent of the total operating expenses and is consequently a real temptation, but its indefinite nature makes it an elusive account. The mechanical men think in terms of physical life, the operating men in terms of obsolescence, the auditing men in terms of financial life, and the result is that an uncertain conclusion is drawn that the average life of a motor bus is five years.

Many Factors Cause Misconception of Depreciation

Ordinary laymen in the transportation industry think of the setting up of a depreciation reserve fund as the process of setting aside money over a period of time from the gross revenue, in sufficient amounts to enable the operator to purchase new equipment when the equipment that is being used wears out. It is based upon the original cost of the equipment and the length of time the equipment is to be used.

Public utility regulatory bodies have specified rules that allow the utilities to set up depreciation reserve funds on units of equipment that have relatively long life. The rules state that the amount set aside shall be based upon the original cost of the unit when installed, and the rate of setting it aside shall be based upon a "fair life" for the equipment. The amounts are set aside through depreciation and depreciation reserve accounts.

Regulatory bodies also have specified rules that wearing parts of any particular major unit of equipment may be renewed through the maintenance accounts. Although maintenance accounts and depreciation accounts are both classed as operating accounts, and as such are deductible from the gross revenue, they are considered as two distinct groups and are so classified.

Relation of Maintenance To "Fair Life"

If the rate of depreciation is to be based upon the "fair life" of any unit, it is important that there be a correct understanding of the term "fair life." If the "fair life" of a bus is to be based upon its physical condition, then it is essential that the maintenance be considered, because each time a worn or defective part of the bus is replaced its physical condition is bettered

Digitized by Google

and its life is prolonged. Since it is possible to replace any part of a bus, its physical life may be prolonged indefinitely. It is evident then, that the "fair life" of a bus cannot be gaged entirely from the physical condition over any definite period if renewals of defective parts are to be made whenever they are needed.

Danger in "Obsolescence" Determination

If the "fair life" of a bus is to be based entirely upon obsolescence, then the assumption must be made that at the end of a fixed period of time the bus will be obsolete. Not considering maintenance this might be a very satisfactory basis for depreciation, except that the word "obsolete" is too abstract. Development in equipment design and changes in service for each particular company cannot be foreseen accurately. Two competent and experienced parties might disagree on the time a bus is obsolete, and yet both parties will have sound reasons for their respective viewpoints. These opinions may vary as much as two or three years on the life of a particular bus or type of bus. When such wide differences of opinion are possible as to when a bus is obsolete, it is evident that obsolescence alone is not a satisfactory basis for establishing "fair life." If a bus were a single unit of equipment, time and experience would soon determine a definite life for it. However, a bus is not a single unit; it is an assembly of a large number of small units that differ in size, shape, structure and in wearing life. There is no established uniform relation between the wearing life of the different units that make up a bus, and much less between different models and makes of buses now being used.

Suppose renewals of units within a bus were made from time to time and charged to the maintenance account and no change was made in the capital or depreciation account. Consider the two following examples to see what the result in each case would be:

First, suppose a bearing becomes worn and it is replaced. Regardless of whether or not the new bearing costs the same as the one it replaced, the transaction will be considered a "replacement in kind" and charged to the maintenance account, in accordance with the rulings of the regulatory body. The new bearing, no doubt, will be similar in every respect to the bearing replaced and will carry the same specifications and identification. Therefore, no charge will be necessary on the property ledger, or in the capital and depreciation accounts, as the charges and credit have been cleared through the maintenance accounts.

Renewals Should Not Be Charged to Maintenance Accounts

Second, suppose the driving gear, body, chassis and accessories of a bus have given satisfactory service and are still in good condition, but the motor is defective and has been a constant source of trouble. Suppose further that a different make of motor is bought to replace the defective one. Usually the bus has been treated as a single unit of equipment and a depreciation reserve fund has been set up accordingly. Therefore, from the accounting viewpoint, it may appear easier to consider the motor replacement a similar transaction to the bearing replacement, a "replacement in kind," or, in other words, strictly a maintenance expense, and not disturb the property ledger. However, regardless of the relative cost of the two motors, the new motor is a different make from the motor replaced and will, therefore, have diferent specifications and identification. The result will be a different bus or unit of equipment than that carried on the property ledger and in the capital accounts for the original bus.

Buses have been universally used as transportation units a comparatively short time, and experience is fast indicating that there is nowhere near a balanced relation of the lives of their major parts. The body may become loose or obsolete long before the chassis and motor have ceased to give satisfactory service, or the motor may prove inadequate and have to be replaced while the body and chassis are still satisfactory. Therefore, the identity of the bus will change from time to time as the circumstances may warrant. If each major change is not followed by the proper change in property ledger and capital accounts, the result will be that after a few years the property ledger and capital account will not reflect the actual field conditions. It is ridiculous to imagine that changes and alterations are not going to be made to buses that will materially change their identity. It is impossible to foresee the development of bus equipment design and the changing service demand to dispose economically of each bus as a complete unit without having changed its identity during its operating life.

It is certainly the duty of the auditing department of every company to have its books represent the facts as accurately as possible. It is essential, therefore, that whenever a physical change affects the identification of a unit the books be changed accordingly. If it is desirable to consider an entire bus as a unit of equipment and set up depreciation upon it as such, then each time its specifications are changed the original unit should be struck off the capital accounts with proper charges and credits to both the capital and depreciation reserve accounts. The new unit with its identity should then be charged to the proper capital account and its life estimated to determine the proper rate of depreciation.

Definite Determination of "Fair Life" of a Bus

The most satisfactory basis for determining the "fair life" of a bus or any unit of equipment made up of a large number of small units, each of a different wearing life, is to find that point in the life of the major unit when the difference in maintenance between the old unit and the new unit, less the difference in rates of depreciation, is equal to the interest on the new investment, namely, the cost of the new unit.

If the operating company keeps an accurate detailed cost accounting system of operation cost per bus-mile, it will show that the maintenance cost will gradually increase for several years until a maximum is reached. The cost will probably stay at that maximum indefinitely, because every time a part becomes defective it will be replaced until finally no perishable part of the original bus will be left. However, it is very probable that before the peak of the maintenance curve is reached, the management will determine that the higher cost of maintaining and operating the old bus over that of a new bus will justify its replacement.

A detailed cost accounting system greatly reduces the necessity of the unsatisfactory guesswork of estimating the "fair life" of a bus and gives a sound economic basis for the retirement of the equipment. A system of this kind has been worked out and is in successful operation by some companies. It can be developed on any transportation system without excessive cost and will many times pay for the expense of its installation and maintenance by picturing true conditions to the management so that its judgment may be sound and accurate.

Transportation Improvements

Recommended for Milwaukee

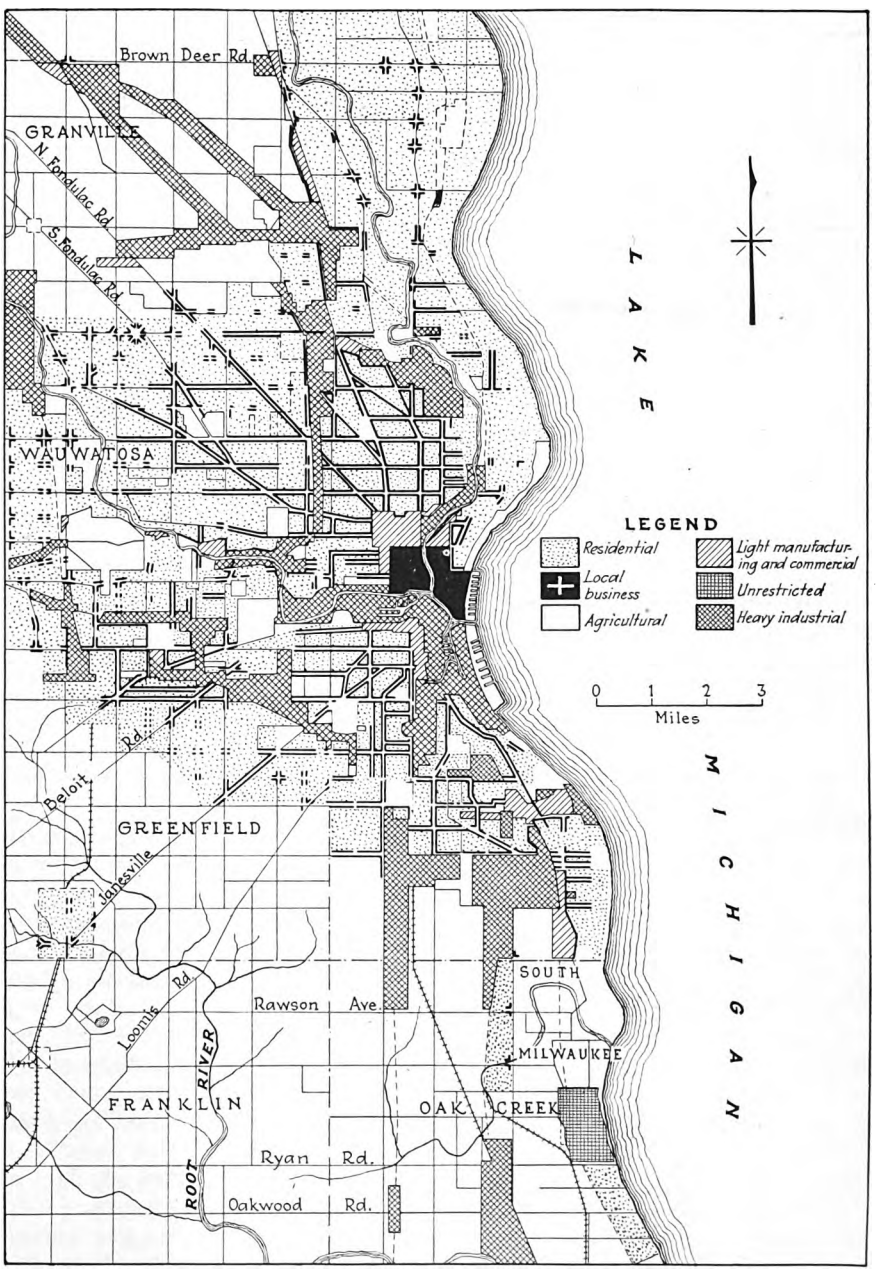
Survey by McClellan & Junkersfeld, Inc., included study of the relation between transportation and general community development. Recommendations were based on an analysis of travel routes of street railway and bus passengers and other vehicles

SECOND ARTICLE

Street widening, arterial highways, rapid transit expansion, semi-rapid surface lines, parking restrictions, improved traffic signals and special traffic routes for trucks were recommendations contained in the first article on the Milwaukee Transportation Survey, published last week. This concluding article contains a digest of the basic facts from which the recommendations were drawn.—EDITOR.

NOT only were direct checks of the use made of transportation facilities included in the Milwaukee transportation survey, but the general plan was far more general in that it embraced other phases of the city's development and planning which affect its transportation requirements. The field work covered a period of several months, so that data could be collected for various seasons of the year. The report consists of two volumes, the first containing text matter, and the second supporting data. One entire chapter is devoted to an analysis of the economic relation between transportation and general community development, including its effect on the value of land and property.

The geographical and topographical features of Milwaukee directly affect its traffic problem. The city is roughly semi-circular in area, limited on the east by the concave shore line of Lake Michigan and extending therefrom about 5 miles westward and an equal distance north and south from its business center, which is relatively close to the lake front. About half a mile inland from the lake front and roughly parallel to it the Milwaukee River flows through the business center of the city from the north. The Kinnickinnic River enters from the south and joins the Milwaukee River near its mouth. In addition to these two streams, the Menominee River, with a relatively



Milwaukee's transportation problem arises from the need for moving a heavy industrial population during short peak periods. Few crosstown lines are available between residential and business districts shown on this zoning map of Milwaukee County

Digitized by Google

deep valley ¾ mile wide, enters the city from the west and joins the Milwaukee River about ⅝ mile from its mouth. The trend of population distribution is shown in the following table, which includes forecasts for 1940 and 1960.

The topographical features of the city, coupled with the wide distribution area of population, results in heavy traffic flow to the central business district from all parts of the city and through the central business district from one outlying district to another. This latter is the result of the development of travel routes connecting each of the outlying districts with the center of the city without proportionate development of direct routes, because of the high cost of north-and-south routes across the Menominee Valley. Such routes as have been developed have required long and high viaducts entailing large expense. The Menominee River valley has been improved with wharves and docks and the stream made navigable half way across the city necessitating movable spans in the viaducts. Development of north-and-south traffic routes west of the navigable portion of this stream has the alternative of low-level routes across the valley, or viaduct construction without movable bridges. There is now heavy north-and-south traffic for which there are but few routes and, according to the report, this traffic will undoubtedly increase rapidly in the future.

DISTRIBUTION OF POPULATION OF MILWAUKEE FROM BUSINESS CENTER,
Third Street and Wisconsin Avenue, 1880-1960

	Per Cent Living Within Various Mile Zones					
Zone	1880	1900	1920	1926	1940*	1960*
1 mile	34.0	16.8	12.4	7.9	5.1	2.5
2 miles	33.6	41.7	31.5	26.5	22.3	11.6
3 miles	17.4	30.8	36.5	33.6	25.0	18.4
4 miles	9.4	6.5	12.7	14.5	17.9	21.3
5 miles	4.0	2.5	4.6	7.0	9.9	16.4
Over 5 miles	1.6	1.7	2.3	10.5	19.8	29.8
*Estimated.	100.0	100.0	100.0	100.0	100.0	100.0

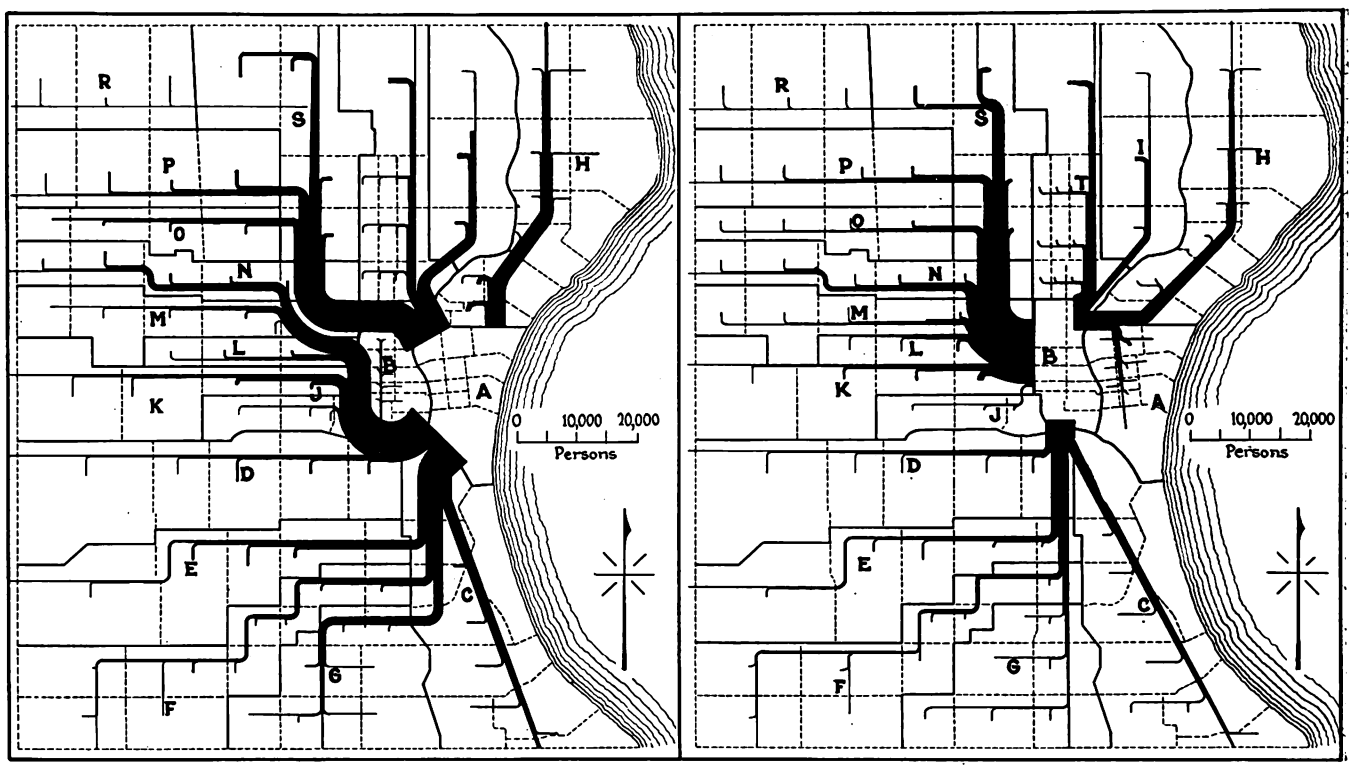
The city is served principally by the Chicago, Milwaukee, St. Paul & Pacific and the Chicago & North-Western railroads. The Grand Trunk, Pere Marquette, and Soo Line railroads and three interurban electric railways also serve Milwaukee. The main railway stations and freight depots are within the central part of the city but on opposite sides of the Milwaukee River. Small outlying depots have been located within manufacturing districts which have grown up at some distance from the business center.

Requirements of Metropolitan Area Studied

The population of Milwaukee, as estimated by the engineers, is 519,000 within the city limits. The Milwaukee metropolitan district, which roughly includes all of the area in Milwaukee County has a population of more than 640,000. The relatively high concentration of population indicates the nature of the transportation problem. The density of population in Milwaukee is 15,300 per square mile and the area within the city is 34 square miles. The population densities in Cincinnati, Kansas City and Buffalo, which have approximately the same total population, are 5,800, 5,400 and 2,900 per square mile, respectively. Only in cities of considerably more than a million population are densities found greater than that in Milwaukee.

Zoning in the city is shown in an accompanying map. This indicates the relatively large area devoted to commercial, light manufacturing, and heavy industrial use. Milwaukee is inherently an industrial city and its growth (approximately 10,000 per year) is almost entirely attributable to the expansion of its diversified industries.

The report introduces statistics compiled by the First Wisconsin National Bank which show that 133,000 persons are employed in the city. This is a higher proportion of total population than is usually found, and affects



Source and volume of employed population movement on a typical week day in January, 1927, was studied for each of nineteen industrial districts into which the city was divided. These typical flow diagrams show the movement of passengers into the two sections of the central employment district. On the left the section east of the Milwaukee River, on the right the western section

Digitized by Google

the traffic problem by producing heavy peaks in transportation requirements and in the demand on public transportation facilities. Transportation habits and requirements in the city were obtained from questionnaires distributed to the employed population. More than 127,000 usable cards were returned from the 133,000 employed persons, or a coverage of more than 95 per cent. The card form used is shown in an accompanying illustration. A similar questionnaire was distributed among students to determine the overlapping of their transportation requirements upon those of the employed population. The extent of this dual demand during the morning peak is indicated in an accompanying chart.

EMPLOYMENT BY DISTRICTS AND MOVEMENT OF EMPLOYED PERSONS BETWEEN RESIDENCE AND PLACE OF BUSINESS

	Location of Employment				
Location of Residence	Central Business District	South Side	East Side	North and West Sides	Total
Central business district	3,772	1,048	202	1,267	6,289
South side	11,683	27,227	307	5,077	44,294
Upper east side	5,503	878	1,259	1,701	9,341
North and west sides	28,801	9,331	1,956	26,493	66,581
Outside county	216	148	8	151	523
Total employed	49,975	38,632	3,732	34,689	127,028

For purposes of analysis the city and county were divided into 181 districts. These were in turn grouped according to business and industry and lines of traffic flow into nineteen "employment districts." These districts and sections are shown in an accompanying illustration which also shows traffic flow diagrams for the two parts of the central business district on either side of the Milwaukee River. Similar charts were used in the study of transportation requirements for each of the other seventeen employment districts.

That Milwaukee depends principally upon street cars for transportation is indicated by the following tabulation of questionnaire results:

	Number of Persons	Per Cent of Total
Street car	69,056	54.5
Bus	1,557	1.2
Bus and street car	4,468	3.5
Interurban car	2,069	1.6
Interurban bus	61	Less than 0.1
Steam railroad	140	0.1
Total public transportation facilities	77,351	60.9
Private automobile	15,298	12.0
Walking	34,166	26.9
Miscellaneous	213	0.2
Total—all facilities	127,028	100.0

Among other analyses made of questionnaire returns was one to determine the travel methods according to distance between places of residence and employment. The results are shown in an accompanying chart.

Routes Converge in Business District

Due to the manner of growth and the concentration of business within the relatively small area of the central business district and also due to the topography, most of the public transportation lines enter this district. It is significant that more than 40 per cent of the total working population is employed in it. Few reside either within the district itself or sufficiently close to walk to and from work. In addition to the traffic movement of the population employed in the central district, the natural terrain and location of routes cause many persons to be transported through it to other centers. The relation of place of residence to place of employment is

Detailed studies were made of approximately 95 per cent of Milwaukee's rush-hour traffic, from information collected on this simple questionnaire form

indicated in an accompanying table, in which, for convenience, the city has been divided into four parts and the working population from outside the county is shown separately.

This table indicates three major daily population movements, namely:

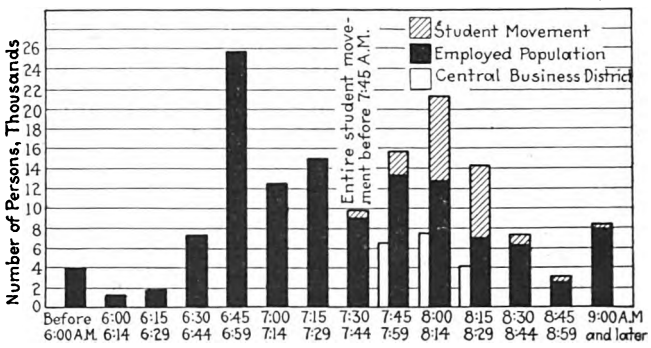
28,800 persons work in the central business district and live on the north and west sides,
27,200 persons work and live on the south side,
26,500 persons work and live on the north and west sides.

City Well Covered by Transportation Lines

Of the total city area only 2.14 square miles, or 6 per cent, is more than one-quarter mile from an existing car or bus line, this proportion being less than that found in any of the several typical American cities of approximately the same size which were visited by the Milwaukee transportation survey committee in 1927. The average of these cities was 22.5 per cent. A study made of the traveling time required to reach the central business district from various sections of the city indicates that during rush hours the time required for this trip is increased from 10 to 15 per cent over non-rush hours.

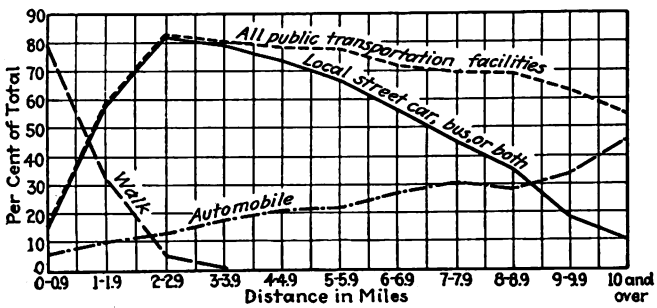
Transportation in the Milwaukee district is under the supervision of the Wisconsin Railroad Commission, which has prescribed certain standards of service, briefly as follows:

During rush periods cars operated two-man must furnish 67 seats for each 100 passengers at the maximum load point, and one-man cars must furnish 80 seats per 100 passengers. During non-rush periods from 110 to 133 seats per 100 passengers must be furnished, the ratio varying with the load on individual lines, unless headway governs.



Overlapping of student travel and that of employed population increases difficulty of public transportation in Milwaukee. In this chart the student movement is superimposed on employee movement according to time of arrival at school or work

Digitized by Google



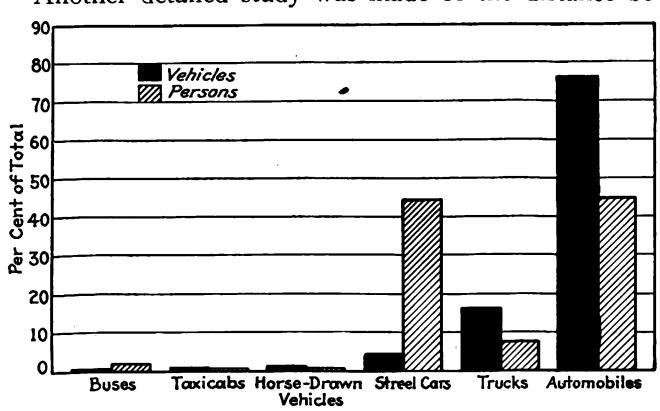
Use of various travel facilities by 127,028 employed persons on a typical week day in January, 1927, was plotted graphically to show the relative importance of each facility and the influence of distance between home and work upon the choice of transportation

A comparison of these standards of service with those specified in other typical American cities shows that requirements for Milwaukee are in general more stringent.

About 160,000 transfer passengers are handled on the lines of the Milwaukee Electric Railway & Light Company on a typical week day and the annual ratio of transfer to revenue passengers is 41.4 per cent for the entire system. On certain crosstown lines, which are essentially distributing lines, this ratio is as high as 60 or 70 per cent. A geographical analysis shows that of all transfer interchange 32.0 per cent is in the central business district; 44.3 per cent on the north and west sides; 19.4 per cent on the south side; 4.3 per cent on the upper east side. Extreme concentration of transfer interchange was found at certain points, particularly along Third Street between Michigan and Center Streets, where 16 per cent of all transfer movements in the entire city take place at seven intersections.

The general practice in the past has been for the bulk of the street railway lines in Milwaukee to be through-routed either from the north to south side of the city or from the east to west. A special study was made to determine the proportion of through passengers on these various lines to see whether such routing was justified and whether traffic was properly balanced. This number was found to be slightly more than 20 per cent of the total traffic within the downtown district and but 9.2 per cent of the total traffic throughout their length. This indicated that the volume of through traffic was not sufficient to be a determining factor in any rerouting which might be justified on the basis of other considerations.

Another detailed study was made of the distance between stops and the relation between the total number on each line and the actual number of stops made. This showed that the average distance between stopping places on the entire system is 590 ft., ranging from an average of 420 ft. in the downtown district to 610 ft. in the residential section. Computations including the time required to walk to car stops and the actual running time of the car as influenced by the number of stops, indicated that the minimum traveling time from home to the downtown district could be secured with an average distance between actual stops of 1,125 ft. Further study showed that on the average stops were made at 75 per cent of the scheduled stopping places during rush periods so that, adjusting for this ratio, the scheduled stopping places should be located 850 ft. apart to give an average distance between actual stops of 1,125 ft.



All the street cars entering and leaving central business district of Milwaukee on a typical week day amounted to less than 5 per cent of the total number of vehicles. More than 75 per cent of this vehicular movement was automobiles. The total persons carried, however, were approximately the same; namely, 45 per cent in street cars and 45 per cent in automobiles

An analysis of time required for passenger interchange was made from some 120,000 stop-watch observations. The results follow:

	Loading Time in Per Cent of Total Trip Time		
	All Lines	Maximum	Minimum
Inbound:			
Morning rush	18.5	28.5	12.3
Evening rush	15.3	19.1	6.3
Morning, afternoon and evening non-rush	14.0	18.5	8.4
Night non-rush	9.3	14.4	4.2
Outbound:			
Evening rush	18.4	24.1	11.8
Morning rush	13.6	17.3	8.3
Morning, afternoon and evening non-rush	12.7	16.7	8.2
Night non-rush	10.7	15.8	4.5

The similarity in ratio of time required for boarding and alighting during rush-hour trips in the controlling direction is striking. More than 18 per cent of the total trip time is consumed in this manner. Further amplification of this particular study shows that at the principal downtown intersections 62.6 per cent of the total standing time during the afternoon rush was spent in loading or unloading passengers, whereas 37.4 per cent was due to delays on account of other traffic.

An interesting aspect of the legal restrictions on speed of street cars in Milwaukee disclosed by the report is that prior to 1927, it was illegal for street cars to exceed a speed of 15 m.p.h. In 1927, this was increased to 20 m.p.h. in residential and business districts and 25 m.p.h. elsewhere. An extended study which covered the extent and frequency of various factors causing delays in street railway service, was made by the Milwaukee Electric Railway & Light Company in 1926, and analyzed in the preparation of the report. This study showed that, in the year 1926, of more than 69,000 delays of five or more minutes, 68.3 per cent were from street traffic and resulting congestion, 6.3 per cent from bridge openings, 5.9 per cent from defective equipment and 19.5 per cent from all other causes. The detailed analysis for the Twelfth Street Line is shown in the table above.

CAUSE OF DELAY (TWELFTH STREET LINE)

	Per Cent of Total Delay Time
Traffic interference due to parking, inability to enter loading zone, pedestrian travel, and waiting for traffic signals	41.1
Street car ahead	17.0
Trainmen's duties	14.0
Difficulties with equipment, including lights out, power off and minor defects	10.0
Automobiles and trucks on track	5.8
Stops at railroad crossings and due to bridge openings	5.8
Reduced speed due to traffic congestion, other vehicles moving in track zone, etc	4.2
Trolley off	1.3
Switching	0.8

It was found that for the entire railway system 30.2 per cent of the cars were on time at maximum load

Digitized by Google

points, 20.5 per cent were one minute ahead of schedule and 12.6 per cent were one minute behind schedule. Of the total cars 14.4 per cent were two minutes or more ahead of schedule and 22.3 per cent were two minutes or more late.

Cordon counts of all vehicles, including street cars, entering and leaving the central business district during a typical week day showed that the total traffic amounted to 189,000 vehicles in both directions, carrying 539,000 passengers. These were distributed as follows:

	Average Passengers per Vehicle	Per Cent of Total Vehicles	Per Cent of Total Passengers
Automobiles	1.7	76.6	44.9
Street cars	29.3	4.3	44.6
Buses	11.4	0.5	2.0

The distribution of this traffic by type of vehicle and passengers carried by each type is shown in an accompanying chart. A similar cordon count was made over the Labor Day week end on the outskirts of the city to ascertain the maximum use of highways entering the city.

Parking Regulations Not Enforced

Special checks were made to determine the degree of enforcement of parking regulations. It was found that out of 2,319 cars checked, 585 or more than 25 per cent violated the ordinance, this ratio running as high as 43 per cent in certain blocks. This study was extended to determine the available parking capacity in streets and in private parking places and garages in the downtown district. It was found that approximately 65 per cent of the parking space in the streets and 60 per cent of the space in private parking places and garages was occupied during the day.

Studies of conditions affecting traffic movement included street widths, speeds of vehicles, interference at intersections, traffic regulation, steam and interurban railroad grade crossings, river bridge openings and terminal movements of interurban cars and buses. The railroad grade crossings and river bridge openings are causes of considerable traffic delay in Milwaukee because of the topography of the city and the presence of three navigable rivers, one of which passes through the center of the downtown business district. The railroad crossing situation is being relieved gradually by grade separations. A separate study was made for the Board of Harbor Commissioners of Milwaukee, dealing with the possibility of reducing or eliminating bridge delays.

In Milwaukee, the base street railway fare on lines of the Milwaukee Electric Railway & Light Company is 7 cents and on the two other street railway lines operating in the city it is 5 cents. The report contains an analysis of costs of various means of transportation estimated for an average 4-mile ride, taken twice a day. A summary of this follows:

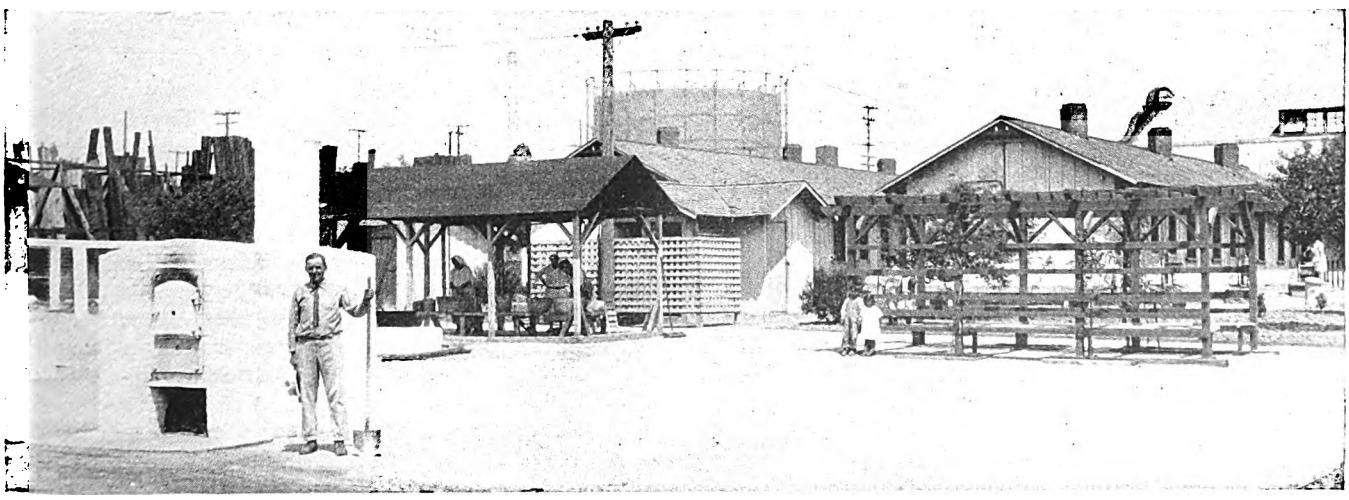
	Cost per Day
Street car—ticket fare	12.5 cents
Cash fare	14.0 cents
Private automobile—variable costs only ($500 automobile)	18.4 cents
"Seat per passenger" bus	20.0 cents
Private automobile—variable costs only ($1,500 automobile)	28.0 cents
Taxicab	$2.90

The report includes a study allocating the various operating expenses of the Milwaukee Electric Railway & Light Company between fixed and variable expenses. From this, the length of haul which under present traffic conditions and rates of fare would yield a 7½ per cent return on the established rate base of the company, was computed. This showed that the average ride for which the present rate of fare is compensatory is 3.1 miles, whereas the present actual average length of ride is 3.8 miles.

Handling Mexican Labor in California

By Paul T. Porter
Los Angeles, Cal.

PRESENCE of the Mexican immigrant is a problem of the great Southwest, just as the South has its negro labor problem, the crowded centers of the East and Middle West have their melting pot of the unassimilated foreign labor to deal with. What the Pacific Electric Railway, operating in southern California, has accomplished in dealing with this humble and conscientious foreigner is an outstanding example of what fair dealing and the application of modern principles of sanitation, education and hygiene can do in overcoming handicaps and making the best of a difficult situation. It is doubtful if a common labor problem more difficult of solution than this which has for years confronted the Pacific Electric



Type of buildings and facilities furnished in the 22 Mexican camps operated, maintained and supervised by the Pacific Electric Railway

Digitized by Google

Railway has arisen at any other point in the United States.

Due to his foreign tongue, his lack of education and the pitiful financial condition in which he usually arrives in this country, the Mexican's adaptation of himself to American conditions of labor, life and living is by no means an easy task. On the Pacific Electric, the problem is further complicated by the widespread activities of this great interurban system, extending as it does over four large counties, any one of which is larger in area than certain Eastern states. It was realized that a helping and kindly hand was necessary if these people were to be counted upon to supply the all-necessary element of brawn so essential in the great building program of this "world's largest interurban system."

The housing problem was that which offered the most serious obstacle to their beneficial employment. All over the West, and in southern California particularly, there are few if any tenement districts and it is questionable if their introduction would, under any circumstances, be tolerated. As a consequence and in deference to this feeling it was deemed advisable to establish housing centers in widely separated areas. At first certain communities did not view with favor the company's effort to establish colonies of these undesirables in their midst. Today, however, due largely to the intelligence that was displayed in building, maintaining and supervising these settlements, this agitation and feeling have to a great extent been overcome, and the company's experiment is regarded as a praiseworthy achievement in social relationship. To quote from an article appearing in a local paper where one of the settlements is situated: "The premises of the colony are kept with a cleanliness and care for appearances that would shame some of the homes and grounds of the community."

When the problem was first approached a number of years ago it became apparent, after careful investigation into the conditions under which this class of people was living, that careful supervision would be necessary. Entire families arriving in this country in ignorance of our language, strangers to our manner of living and having nothing in view but a hope for providing a better living for themselves, left much of a humane nature to be done. Often they had neither adequate clothing nor food nor the means wherewith to provide these necessities. In assuming the responsibility of introducing a people thus poorly equipped into an American community of advanced ideas and a uniformly high standard of living and culture, the Pacific Electric conceived it to be its duty not only to provide the means of obtaining a livelihood but also to educate these immigrants in the elements of cleanliness and right living. It was also desirable that they become good American citizens in the event that they decided to make their stay in the country a permanent one. As a means to this end the company has established a supervision of their camps which has worked wonders in the last few years with the result that cleanliness, happiness and prosperity mark the inhabitants of the camps under the control of the company throughout its entire system.

In each of the 22 camps there is an attendant employed to look after the general upkeep of the buildings and grounds connected with them, while in the ten largest camps two men are thus engaged. A trained nurse visits the camps regularly, giving instructions in sanitation and hygiene and offering advice in regard to medical treatment and care. The children of school age are sent to school and the parents are urged to see that they appear in a clean and tidy condition.

Scene in a typical Pacific Electric Mexican labor camp. The camp nurse, standing among the children, supervises their health, sanitation and general welfare

This work is carried even further. At various times during the year requests are sent out to the American employees of the company for toys, wearing apparel, etc. The contributions are collected, sorted and distributed where they will do the most good. Each year at Christmas suitable gifts are presented to the children by the company and at the annual picnic a special committee is appointed to 'provide entertainment for the Mexican employees and their families.

Occasionally families that have found themselves, so to speak, and are well on their way to becoming good American citizens will leave the camps and establish homes of their own. The company does not consider its obligation ended in such cases, however, and continues to offer in a general way help and supervision where it is needed.

These camps, while they may not be the highest type of modern living quarters, are at any rate clean, sanitary and wholesome; they are fulfilling an important economic need and are relieving charitable organizations of considerable humanitarian work that would otherwise be necessary. Above all, it is felt that they are meeting a problem of international relations in a manner creditable to the company and the community which it serves. The company feels that it is being well repaid for the effort put forth and the work is to be continued.

What Are You Doing To Meet Competition?

Electric railways cannot hope to succeed in the effort to win back lost patronage unless they keep pace with the rapid development of automobiles. Continued operation of obsolete equipment is a most serious handicap

By E. P. Waller
Manager Railway Department General Electric Company, Schenectady, N. Y.

EACH electric railway, steam railway and bus company is in reality a manufacturing company producing a definite product—transportation—which it is selling to the public at a fixed price. Are you making a profit, or are you spending your stockholders' money and selling your product at less than cost? Before we can analyze the methods of operation to put your business on a paying basis, we must first look at your equipment to see if you have modern tools to produce at a reasonable cost this transportation service which you are selling to the public.

In this article, which is based on a paper read before the Association of Equipment Men, Southern Properties, the author calls attention to the serious situation that arises from the failure of electric railways to keep pace in the replacement of obsolete equipment. Figures that have been available for some time indicate the staggering price which railways are paying for this backwardness in car replacements.

The technical press has published from time to time splendid articles on operating methods and types of equipment that have been found to produce good results. Investigations made by ELECTRIC RAILWAY JOURNAL more than two years ago showed that 34 per cent of the electric railway cars operated in the United States were over twenty years old and were obsolete, and that 54.5 per cent of the cars had been in service for fifteen years or more. These figures must be materially higher today and I dare say that there are more than 40,000 cars in daily operation that are so obsolete, so inefficient and so expensive to maintain that their continued operation is subject to most serious question. How can you expect to manufacture transportation economically with obsolete tools of this kind? Don't forget that there are two sides to this story: one is the manufacturing problem and the other the sales problem. What sales resistance are you meeting in the sale of your product to the public? Are you doing anything to attract the rider or are you giving him a product that you feel you should apologize for and he feels a little ashamed to purchase? During the year 1927 only 1,220 new rail cars were purchased by the electric railways in the country. These same companies purchased approximately 1,600 buses while your customer, the public, was purchasing something like a million private automobiles.

It may sound a little foolish to compare the purchase of street cars and buses with the private automobiles purchased by the public. But where is your competition? In the early days of the bus we heard a great deal about bus competition with street railways. To my mind that was never a serious problem. Your problem in disposing of your service—in selling it—arises from the competition offered by the increasing use of the private automobile. The question of traffic congestion, the parking of private automobiles in the city streets, which were never intended for such use, is becoming a more and more serious problem every day and within the next few years will force the municipalities of this country to enact stringent regulations. The parking of automobiles within a given radius of the business section of any city will be prohibited. To anticipate that situation it is highly important that electric railways improve their own service by discarding these 40,000 obsolete cars which are reaching or have already reached the quarter century mark.

For the first six months of the year 1928 less than 200 new cars have been purchased despite the convincing figures in dollars and cents that justify a tremendously higher rate of equipment renewals. In 1926 a survey was made by ELECTRIC RAILWAY JOURNAL. Forty typical roads operating in all parts of the United States were selected and the operating costs tabulated for a period of years. Twenty of these roads had purchased practically no equipment within ten years; on the other twenty, about 50 per cent of the cars were not over ten years old. Both groups operated about the same size and total number of cars, both served the same total population and both had the same proportion of city and of interurban tracks, and a comparable level of labor rates.

The total operating cost of the twenty backward properties was 37.94 cents per car-mile. The corresponding cost of the more progressive group, although only half

Digitized by Google

of its equipment could be considered modern, was only 28.29 cents per car-mile. This shows the economic value of modern equipment. If all the equipment of these twenty roads had been modern a much better showing could have been made. To make sure that the difference was due to the equipment and not to more efficient management, a further comparison was made between operating costs of the same properties before and after modernization. This showed that the second group had been operating a little below the first group, or 36.41 cents per car-mile as compared with 37.94 for the first group. By replacing 50 per cent of the old shipment a saving of 8.12 cents per car-mile was effected. This would indicate a possible saving of 16 cents per car-mile if all obsolete cars had been replaced with modern equipment. On five roads of the group this had been done. The operating cost of these five roads using nothing but modern cars was 23.64 cents per car-mile as compared to 39.56 cents per car-mile prior to the modernization or almost exactly 16 cents car-mile reduction. Of this 16 cents saving 12 cents was saved in power and maintenance, a reduction of 55 per cent, and 4 cents was saved in transportation expense, mostly through one-man operation, a reduction of 28 per cent in this account.

There is no reason to suppose that similar results cannot be shown on any property where the conditions are comparable. The savings alone will amply justify the replacing of old equipment. Two hundred and six electric railways reported to the American Electric Railway Association an average cost for the year 1927 of 31.4 cents per car-mile, of which power and maintenance cost was 12.26 cents per car-mile, and the transportation account was 13.54 cents per car-mile. A 55 per cent reduction on the first item would be 6.74 cents and a 28 per cent saving on the second 3.79 cents, giving a total of 10.5 cents per car-mile, which would mean a saving of $4,150 annually on each car purchased on the average of 39,500 car-miles per year, the average shown on the 206 properties referred to. This amount is approximately 30 per cent on the first cost of a modern light-weight A.E.R.A. standard car, or 2½ times the fixed charges.

The roads in the Southern territory probably show a lower average than those given. But very few roads will be found that will not average at least 10 cents for power and maintenance on routes where old heavy-weight cars are operated, and probably none that will be that low for transportation accounts without one-man operation. On such properties a saving of 8 cents per car-mile, or $3,160, per car per year could be shown, which is equal to a return of 20 per cent on the investment in a modern light-weight car.

Modern equipment will do more than affect the operating cost, for quieter operating cars, better looking cars, more comfortable cars and faster operating schedules appeal to the public and unquestionably will bring appreciably more riders, with resulting increased gross earning. Assuming that the substitution of new cars will bring in only 5 per cent increase in gross, this will, in many instances change a net loss to a profit.

If a manufacturing company should attempt to turn out its product with tools as obsolete as the cars many of the transportation companies are using today to provide their service, the inevitable result would be that the sheriff would soon take charge of the plant. I beg you to take an inventory of your equipment, modernize your tools, and I am very sure that the results will be more than gratifying to your stockholders.

A modern double-truck city car will weigh not over 60 per cent of the weight of cars with similar seating capacity built fifteen to twenty years ago. In the interurban field weight reductions of at least 50 per cent can be effected. The saving in energy consumption is nearly in proportion to the reduction in weight, there is materially less wear and tear on rails, joints and ties, less damage to pavement, less arcing at the trolley wheels, and the life of track is prolonged and the cost of upkeep of maintenance-of-way and structures materially reduced. Maintenance of equipment is in most cases reduced at least 50 per cent through the improvement in material and designs in the modern car and its component parts.

Modern light-weight equipment permits faster schedules, even when operated with one man, and the later designs readily lend themselves to the use of one man instead of two in all classes of service—city, suburban and interurban. To the direct economies of one-man operated cars, there should be added the savings due to operating a smaller number of faster cars for any given headway, and the increased riding that usually follows improved schedules.

If a manufacturing company should attempt to turn out its products with tools as obsolete as the cars many of the transportation companies are using today to provide their service, the inevitable result would be that the sheriff would soon take charge of the plant. I beg you to take an inventory of your equipment, modernize your tools, and I am very sure that the results will be more than gratifying to your stockholders.

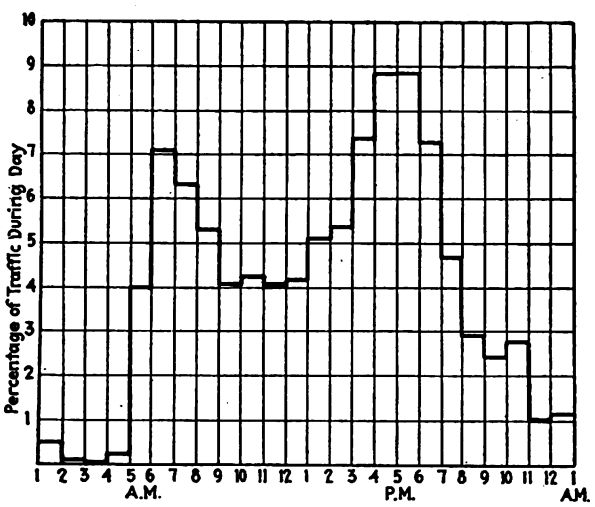
Traffic Is Growing in Berlin

TRAFFIC on the Berlin transportation lines is growing, according to an article in *Verkehrstechnik* for June 29. The figures for 1927 and 1926 follow:

TABLE I—PASSENGERS CARRIED IN BERLIN, GERMANY, (IN MILLIONS)

	1926	1927
Street railways	813.2	834.7
Elevated and underground	163.2	222.5
Omnibus	112.8	156.7
Total of above	1,089.2	1,213.9
Stadt, Ring and Vorortbahnen	371.0	379.0
Total of all four	1,460.2	1,592.9

In this calculation, a passenger who transfers from one vehicle to another of the same kind is counted only once, but if he transfers from one means of communication to another, he is counted twice. Beginning on March 15, 1927, a flat fare of 25 pfennigs permitting a transfer generally between street railway and elevated and a somewhat limited transfer between these two means of transport and the buses was put into force. The street railways, elevated and subway, and the omnibus lines are controlled by the city, the Stadt, Ring and Vorortbahnen by the Federal Railway Company.



Hourly traffic on average week day, Berlin surface lines

On the street railways, elevated and subway and omnibus lines, traffic per day by months did not vary greatly during 1927, except to show a gradual up-trend. Traffic by days of the week was also fairly constant except that Saturday was the high day for all means of transport and Sunday the low day. An hourly count of passengers carried on an average week day by the street railway system is reproduced. On the elevated line the peaks are somewhat more emphasized. The bus curve does not differ greatly from the street railway curve.

A comparatively large proportion of the business on all means of transport is by commutation tickets. On the street railways, 38.3 per cent of all rides are taken with some form of commutation ticket.

The average speed as determined by the car-miles divided by the car-hours was as follows: Street railways, 8.9, rising on Sundays and at times of light traffic to 9.6; elevated and subways from 14.9 to 15.3; omnibus 9.1.

At the end of 1927 the rolling stock of the street railways consisted of 1,880 motor cars and 1,761 trail cars, or a total of 3,641 cars. Three hundred center-entrance motor cars have been ordered. They will operate either singly or in multiple-unit trains.

The elevated and underground system has 427 passenger motor cars and 401 passenger trail cars, all of one class. Up to March, 1927, cars of two different classes were operated.

At the end of 1927, 561 buses were in operation and 104 had been ordered. The latter were of the six-wheel double-deck type with balloon tires.

The street railways had 8,339 motormen and conductors, 4,177 repair men or other hand workers, and 886 office employees. The division on the bus lines was respectively 2,023, 787 and 383. The elevated had 6,200 employees altogether. A consolidated operating report for the three means of transit mentioned is presented in Table II.

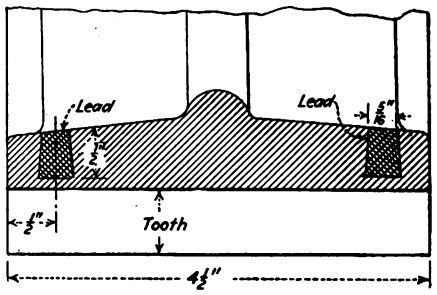
TABLE II—CONSOLIDATED OPERATING REPORT, STREET RAILWAYS, ELEVATED AND UNDERGROUND AND OMNIBUS LINES IN BERLIN DURING 1927

Operating expenses	M120,429,000	$30,107,250
Renewals and depreciation	26,542,000	6,635,500
Taxes	26,354,000	6,588,500
Return to capital	16,379,000	4,094,750
Surplus	896,000	224,000
Total receipts	M190,600,000	$47,650,000

Reducing Street Car Noises

Market Street Railway leads gears, places acoustical cloth under floor boards and uses rubber pads to accomplish this end

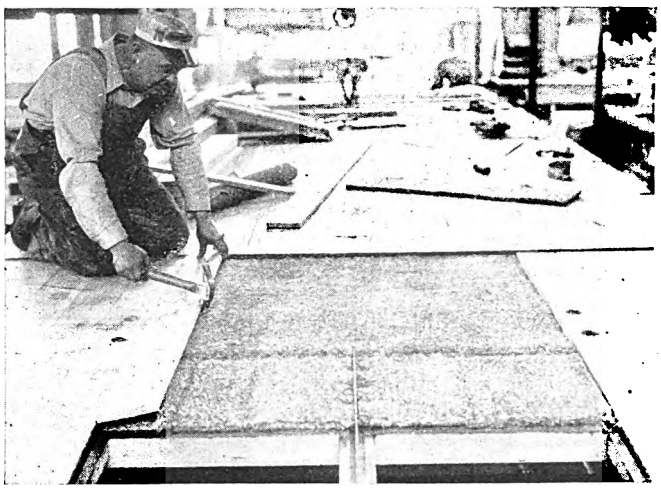
FOLLOWING out its policy to make its service more attractive to the public the Market Street Railway of San Francisco has recently been giving considerable attention to the matter of reducing the noises of car operation. Realizing that axle gears are an important factor in the transmitting of wheel noises into the car body, special effort has been directed toward deadening the noises arising from this source. Very satisfactory results have been accomplished by cutting grooves $\frac{5}{16}$ in. deep and $\frac{1}{2}$ in. wide on the under faces of both sides of the gear rim and filling these grooves with lead. The process is illustrated in the accompanying illustrations. The grooves are cut with a slight slope and left rough on the



Cross-section of rim of 67-tooth gear showing position of lead rings

Rubber pads are placed between car body and frame to reduce transmission of noise

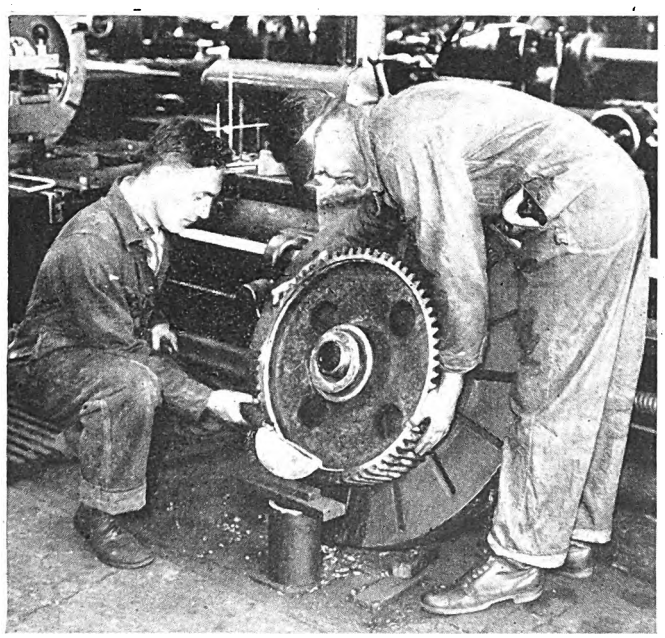
Digitized by Google



Placing soundproof insulation between car floor and frame. The entire floor is covered in this manner

last cut so as to retain the lead, which is poured in a molten state and is not calked, an acetylene torch being used to flow the ends together. Early practice was to shroud the gear case with acoustical cloth, but this was abandoned as being unnecessary.

Other practices developed to reduce noises arising from operation are the placing of a $\frac{5}{8}$-in. rubber pad under the center plate on the truck, the insertion of canvas between axle and axle collar, and the placing of $\frac{1}{2}$-in. acoustical cloth under the trolley base. Acoustical cloth, covered with acoustical cement, is placed under



Pouring a thin lead ring into a groove in a gear

the floor boards for the entire length of the car, in addition to which the entire floor is covered with Industrial Karpet laid with P. & B. paint. Half-inch acoustical cloth is placed under the trolley board saddles, felt is used to line the motor case cover groove, armature cap and axle cap covers are insulated with canvas, and $\frac{3}{16}$-in. rubber buffers are used on door jams and pockets to cushion the jar of the door. Compressor boxes are made of wood instead of metal. Body sills are insulated from the bolster "Z" iron with $\frac{3}{16}$-in. rubber pads. The result of these measures has been a marked reduction in the ordinary noises produced by operation, and the company plans to follow the same practice on all of the 26 cars which it will build in 1928.

An Ideal British Tramcar

Prize essay in Municipal Tramway and Transport Association contest gives details of ideal car from engineering and passenger points of view

WITH the desire to find the points which make up an ideal tramcar, both from the standpoint of the engineer and that of the passenger, the Municipal Tramway and Transport Association of Great Britain conducted an essay contest last year. The paper submitted by J. F. Richards, rolling stock superintendent Oldham Corporation Tramways, was awarded first place. His paper is interesting to American readers, since it gives in detail those elements which are considered desirable in a tramcar to meet the conditions that exist in Great Britain. Following are the principal points he brings out:

Cars are usually considered in terms of carrying and earning capacity. Although an engineer designs the car to fulfill these requirements, it does not necessarily follow that he agrees with the principle. For instance, there is a good deal to be said against the double-deck car. In order to arrive at the ideal, earning capacity will not be considered.

Since the primary function of a tramway car is to convey the public, it must have everything that makes for safety and comfort; it must be capable of maintaining a fairly high speed and insure both smooth and quick acceleration and retardation; it must be hygienic and easily kept clean and attractive. The design throughout should permit the car to give maximum all-round efficiency for a minimum maintenance charge. The equipment must be disposed and installed so as to be easily inspected, adjusted and operated. The human element should be reduced to the minimum.

Favors Single-Deck Car

To meet the above conditions, the car should be of the single-deck, vestibuled type, mounted on a single truck or on double trucks, depending on the physical nature of the route and the required length and passenger capacity. A double-truck car could be 35 ft. long between body corner posts, while a car on a long wheelbase single truck might approximate 24 ft. between corner posts. The sills should be continuous to the end of the platform, and the platform floors should be continuous with the car floor.

There must be no heavy unsprung parts, such, for example, as motors. Bearings should be of the ball or roller type; motors of the light-weight, high-speed type, their horsepower to be determined by general conditions, with differential and worm-driven axles, connection to the motor being with a Cardan shaft and universal couplings. The wheels must be mechanically attached to the axles by means of splines in a manner similar to that adopted in automobile practice.

Service and emergency braking should be by internal expanding blocks acting on drums which form an integral part of each driving wheel or else on a separate drum, mechanically attached to the wheel center. They would

Digitized by Google

be air operated and hand controlled. A secondary rheostatic brake would be operated through the controller but would be used only in the event of the failure of the air brakes. All air equipment would be placed below the floor level. Air sanders would also be included. Controllers would preferably be of the contactor type, of robust design and fixed in such a position that it is easy to operate them while the driver is seated.

Doors and steps would be of the folding type, interlocked, and controlled either by the conductor or the motorman. At busy periods, passengers would enter the two-man car at one end and leave at the other. On a one-man car, all entrances and exits would be at the front end only.

The body should be secured to the truck in such a manner that the bolts can be inserted or removed without removing various fixtures and panels. The body under-frame, side frame and miscellaneous members should be of light-weight metal, machined and drilled in jigs so as to be interchangeable. The body should have straight sides, giving maximum interior width. Window glass should be fitted into single-unit metal sashes with fillets at the corners to preclude dirt collecting. Window sash would slide upwards for removal from the exterior only. Ventilation should insure the adequate extraction of vitiated air and a fresh supply of new air.

Lighting wires should be run in channels built into the roof and sides with molding covering them to form a part of the inside roof preparation. Power cables would be carried in a trough or channel in or immediately above the body sills. All switches, fuses, lightning arresters, choke coils, etc., would be mounted in the motorman's cab.

Provides Comfortable Seats

The seating would be transverse, with individual seats set side by side in pairs. The seats would be of the bucket type, formed out of plywood or a material which could be set or molded into the desired shape, and mounted on a centrally fixed metal pedestal on which they could revolve. Seats would not be upholstered.

The floor surface would be of composition, slightly crowned towards the sides to drain off water. There should be a fillet where the floor adjoins the sides, to prevent the accumulation of dirt and facilitate cleaning.

Hand-rails and grab-handles should be of a non-tarnishing metal, preferably stainless steel. No lacquered fittings should be used, as the transparent lacquer quickly deteriorates. The exterior would be finished by the cellulose spray process, with a minimum of striping, but with suitable design as desired.

Destination sign boxes would be built in at the end of the car and at the side center windows.

For country service powerful headlights could be fitted on the car roof, but they should have dimmers. For normal city service, two single side lights built into the car vestibule dash are sufficient.

The trolley collector gear must be as light as possible, requiring a minimum tension to keep the trolley wheel on the wire. The driver should have a totally inclosed cab and should be seated. In front of him should be a clear glass window, the lower portion of which would be fixed, while the top portion would be hinged. Immediately over this should be another adjustable screen glazed with anti-dazzle glass. This secondary screen would prevent rain or snow driving on to the clear glass and could be thrown down to cover the clear glass to prevent eye strain during brilliant sunshine. All of the end glass should be of the non-splinterable type. Roller curtains should be fitted to the rear cab windows to prevent reflections from the car lights blinding the motormen.

The car should be attractive and distinctive of appearance without advertising matter. It should be comfortable, safe, silent and smooth running. Motor control and brakes must be designed to give easy and gradual starting and stopping. There should be a "dead man's handle" so that the car could be stopped automatically in emergency. There should be some means to arrest the progress of the car should it get out of control and run backwards.

Passenger's Viewpoint Considered

Ingress and egress must be easy. The doors and steps should be so arranged that passengers enter at one end and leave at the other end. This system of loading and unloading would help considerably in speeding up the service. The single deck is advantageous to the passenger, eliminating stairs and increasing safety, speed and comfort. It would also decrease the stopping time.

Comfortable upholstered seats arranged transversely are to be preferred. If possible, they should be individually arranged, with the seat back shaped. The aisle should be of such a width that standing is out of the question. The space might better be devoted to seating area. Foot rests are desirable, but may be tubular so that they can also be used to inclose warm air heaters. Control of the heating element might be made individual. There should be no cleats on the floor, but the surface should be made of a non-absorbent material which could be washed.

The floor and sides should be durable and should be packed with sound reducing material. Windows should be glazed with triplex glass and should be fixed. An electric fan would be desirable for use on hot days. A supplementary window frame and sash glazed with anti-dazzle glass for each individual window would be desirable. These should be arranged so that they could be slid up to cover the ordinary window completely.

Commodious baggage racks are an accessory which should be provided. Artificial lighting must be adequate but restful. Brilliant lighting is not necessarily comfortable lighting.

Besides the ordinary destination and route indicators visible from the outside, special route signs, to be illuminated at night, are recommended.

New Theory on Electrolysis

FROM an investigation of oil pipe line corrosion the Bureau of Standards found that a huge earth battery, releasing electricity of low voltage, may be formed when a metallic pipe passes through soils of different chemical composition or moisture content. In the course of an attempt to correlate soil conditions with the corrosion found on an oil pipe line, measurements of electric current were made on several sections of the line. It was found that in some places the line was collecting current while at other points current was discharged, the points of discharge corresponding in a general way with the place where the line was corroded.

The line was 35 miles from the nearest electric railway and there was no evidence of stray railway currents. Apparently the corrosion was caused by the action of large galvanic cells formed by the pipe line passing through soils of varying chemical composition.

Maintenance Methods *and* Devices

Hot-Pot Trailer for Patching Pavement*

By Charles Herms
General Foreman
San Diego Electric Railway,
San Diego, Cal.

PATCHING of asphalt paving along the tracks of the San Diego Electric Railway is facilitated by use of the hot-pot trailer illustrated. It was designed and built in the railway's shops. It is of all-metal welded construction. A Buick chassis was used and the springs were reinforced to carry the load. The original wheels were turned down and a $\frac{5}{8}$-in. steel tire was shrunk on and turned to the proper taper to take a 30x5-in. R.M.C. tire.

The hot pot consists of a round tank of $2\frac{1}{2}$ bbl. capacity. The body box is divided into two sections. One holds $\frac{2}{3}$ yd. of crushed rock, and the other $\frac{1}{3}$ yd. of rock screenings. The sides of the body are inclined outward so a man standing alongside can shovel out the rock and screenings.

The pot is fired by cut-up pieces of old wooden ties, and the heat is controlled so that it can be directed around the pot or it can be diverted so as to pass underneath the rock and screenings through a flat flue 4 in. high and 33 in. wide. From this it passes through the rear smokestack. Provision is made by means of dampers, so that the heat can be divided and part of it directed each way. After heating, the material combines more readily with the oil.

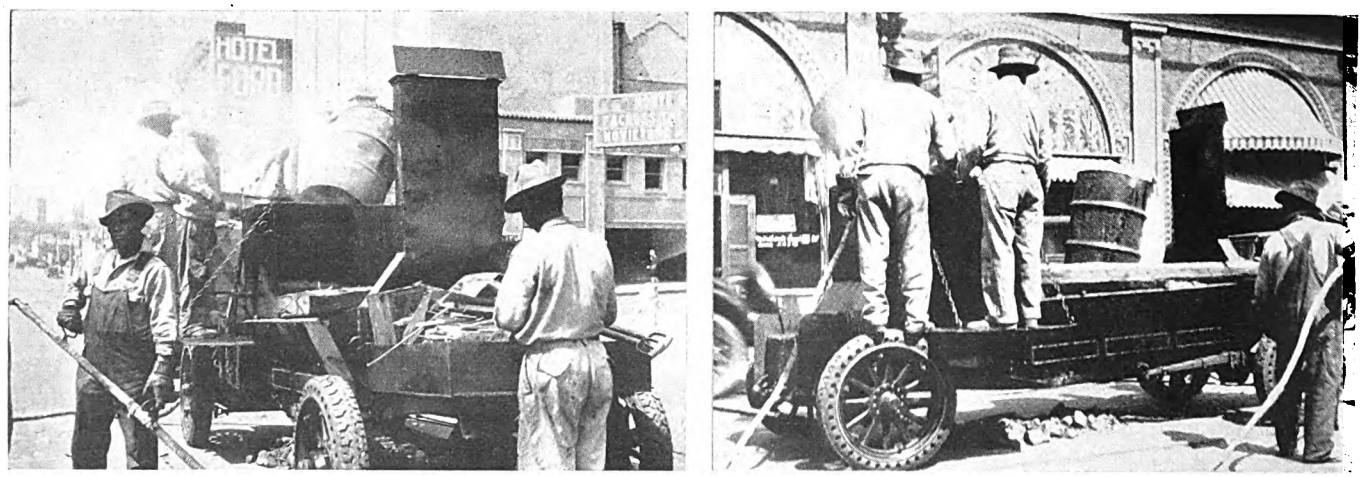
The oil is forced out into a hose line for distribution by means of a geared pump in the bottom of the hot oil pot. This is driven by a sprocket and chain, geared so that three turns of the hand crank produce one turn of the pump. Sufficient pressure is thus placed on the hot oil so that it is thrown out with some force and readily penetrates crevices of broken pavement. After the pavement walls at the edge of the patch are primed, the proper amount of crushed rock is filled in and the oil sprayed on under pressure. A special nozzle is used which has a flat aperture so as to spread the oil out in a fan-shaped spray. After the oil is sprayed on, a covering of rock screenings completes the job. It is advisable to tamp the work down somewhat after spreading the screenings. For holes that are several inches deep it is necessary to fill in alternately with layers of rock and oil so as to make a good bond. A flexible steel hose is used with an 8-ft. length of $\frac{3}{4}$-in. pipe. This has two handles, the lower handle operates a cut-out cock to shut off the flow of oil. If the spray is not to be used for several minutes, the operator reverses the pump, which sucks the oil out of the hose back into the hot pot. Otherwise there is danger of the oil becoming hard. Then it is necessary to heat the hose to get the oil flowing again.

A perforated sheet metal screen is installed around the pump, so that when a new barrel of oil is added the cold oil will not get to the pump and clog it. The pump operator stands on a folding platform which is raised while traveling to and from the work. A brace is installed across the pot in such a manner that a barrel of oil can always be carried in an inverted position in the pot. The oil used is quite heavy and takes about 30 minutes to run out. By having a support for the barrel no attention is required after it has once been placed in the pot. A sheet metal box in the rear of the trailer carries the necessary fuel and tools. The trailer is also equipped with brakes which are operated by means of a chain from the towing truck. Use of this equipment has resulted in a considerable saving in cost of street repairs.

Submitted in Electric Railway Journal Prize Contest.

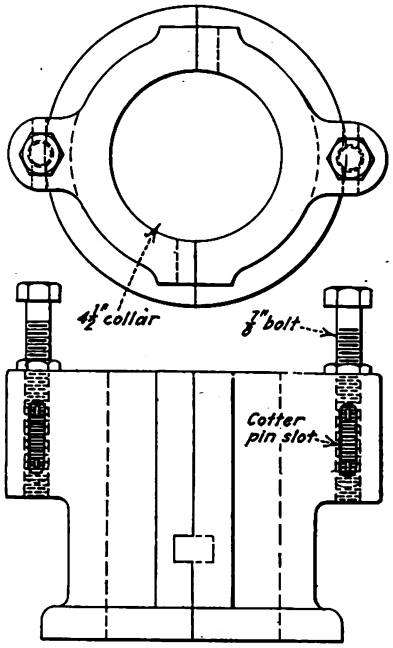
Axle Collar Adjusting Bolts Held Rigid

MOVEMENT of the adjusting bolts in axle collars caused considerable trouble on the Richmond Railways, Inc., Staten Island, N. Y., until a method was devised to prevent it. The collars furnished originally with the motors had a $\frac{3}{4}$-in. adjusting bolt threaded into a lug. A cotter pin was inserted in the bolt through a slot in the lug to prevent turning. This arrangement permitted a slight movement of the bolt in the casting, causing appreciable wear on the threads and shearing of the cotter pins. The result was that the bolt adjustment was lost and the



Hot-pot trailer used by the San Diego Electric Railway for making pavement repairs

Digitized by Google



Locknuts for axle collar adjusting bolts

motor shifted. This trouble has been eliminated by drilling and tapping the casting to take instead of the ¾-in. bolt, a ⅞-in. bolt with a locknut in addition to the cotter pin, as shown in the accompanying sketch.

A careful inspection of these bolts after long service has shown that shifting of the adjusting bolts has been eliminated.

Substantial Rail Fastening*

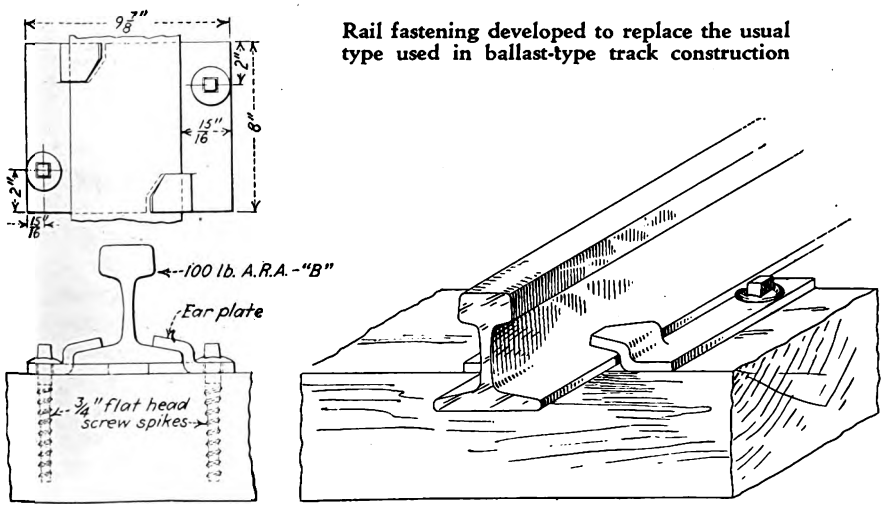
By I. O. Mall
Assistant Superintendent of Roadway
New Orleans Public Service, Inc.,
New Orleans, La.

FASTENING the rails to the ties in ballast type track construction of the New Orleans Public Service, Inc., is being accomplished by a combined tie plate and lock designed to replace the usual type of rail fastening. It consists of an ear plate which is held in contact with the tie by flat-head screw spikes. There are two ears on the plate which are placed diagonally and so spaced as to come into fishing contact with the base of the rail when the plate is in proper position. The plate is held in contact with the tie by two flat-head screw spikes spaced on the diagonal opposite the ears.

With this arrangement the spike functions only as a fastening device for holding the plate in contact with the tie in such a manner that it cannot move. The rail is held in position and to gage by the ears on the tie plate. The fastening is more substantial than the usual installation of hook-head spikes. An element of flexibility is maintained by virtue of the distance between the ear and the flat-head spike fastening. The direct strain due to rail movement is removed from the spike. This feature allows an increased life in the spike fastening so that it will last throughout the life of the tie without maintenance.

The observed action and effect of this type of fastening over a period of years shows that the track remains true to gage, that the tie plate remains in firm contact with the tie and that there is no appreciable churning of the ties on the ballast due to the more rigid type of fastening. In some places where electrolysis has been bad the ears have been electric welded to the base of the rail and the screw spikes spot welded to the tie plate. Those installations where welding has been done show results no different from a maintenance point of view than where the welding was omitted.

*Submitted in Electric Railway Journal Prize Contest.

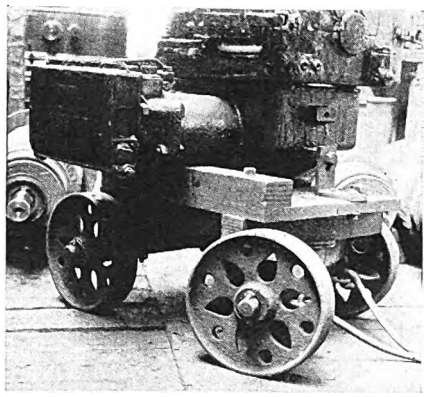


Rail fastening developed to replace the usual type used in ballast-type track construction

Special Compressor Truck

SAFE transportation of its apparatus is given considerable attention in the shop of the Richmond Railways, Inc., Staten Island, N. Y. Special trucks are used for carrying certain parts of equipment in order to guard against accident. The accompanying illustration shows a hand truck designed and constructed in the shop for the transportation of air compressors.

The platform of 1-in. planks is bolted to a rear bolster 2¾x5½x17 in. and a front bolster 2¾x2½x17 in. All woodwork is oak. A block 2¾x2½x17 in. is bolted to the front axle. This



Type of truck used for transporting compressors in the shops of Richmond Railways, Inc.

axle is held in position by a ¾-in. king pin passing through the center of the platform and axle bolsters. The weight on the front axle and the rotating movement of the front wheels is taken care of by two disks ¼ in. thick and 5 in. in diameter. One is bolted to the platform bolster and the other to the axle bolster. The axles are made from 1¼-in. stock and the wheel fits are 1 in. in diameter. Axles are spaced at 18 in. centers and are mounted on iron wheels of 11 in. diameter and 2½ in. face. The wheel centers are 21 in. A ¾-in. round iron handle 5 ft. long provides for easy movement. It will be noticed that an oak block 3 in. wide and 2¼ in. high is bolted to one side of the platform and forms a rest for the compressor cylinders. The bottom of the crankcase rests upon the platform. For further safety a ½x2½-in. angle is bolted to the platform and the vertical leg drilled to meet the compressor suspension bracket hole. Bolting this bracket to the compressor assures its safe transportation under practically any condition. Since this truck has been in service not a single compressor has fallen to the floor.

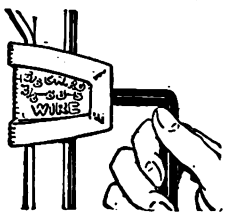
New Equipment Available

Grounding Wire Connection Clamp

DESIGNED to encircle the ground rod and bind the grounding wire directly to the driven member a simple and effective grounding wire clamp has been announced by the Copper Weld Steel Company, Glassport, Pa. With this method no solder or heat is required. The clamp is placed around the rod, the grounding wire is inserted, and by tightening a set-screw the connection is formed. Advantages claimed for this method are the elimination of the melting pot, ladle and other soldering equipment, and a reduction in the time needed to effect the connection.

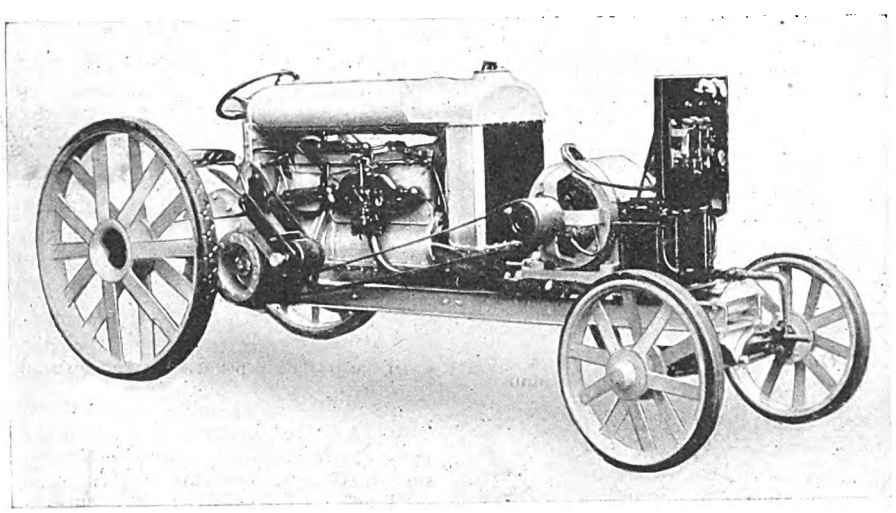


Clamp for grounding wire connection

Arc Welder Mounted on Tractor

MOUNTING of a new kind for the standard Lincoln Electric Company's Stable-Arc welder has been announced by the Pontiac Tractor Company, Pontiac, Mich. The welder unit with stabilizer and panel are mounted on a frame which attaches to either the McCormick-Deering 10/20 or Fordson tractors. The Pontiac mounting gives a four-wheeled rubber tire self-propelled unit, which is capable of hauling heavy loads. This unit is also mounted on crawlers for soft ground work.

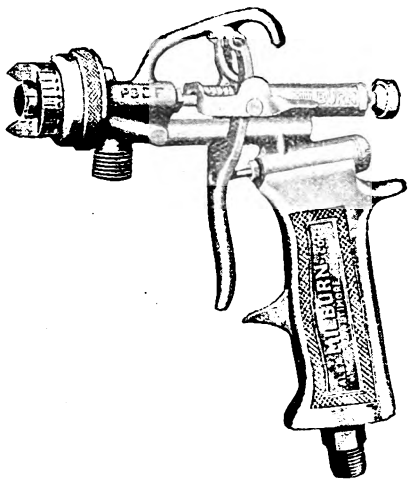
Power is taken from the tractor to drive the welder through a power take-off pulley, which has a clutch, allowing it to be thrown out or into gear at will. The forward drive of the belt brings the belt tightener into correct relation with the belt.



Tractor mounting for electric arc welder

Dialed Head Added to Spray Gun

STANDARD spray guns manufactured by the Alexander Milburn Company, Baltimore, Md., have been augmented by two recent additions.



Improved features added to spray gun

The first of these is a dialed head which gives numerous different spray adjustments from a circular spray to a fan of a wider field than has been possible heretofore with spray guns.

The second addition includes a series of indicator numerals on the paint valve plunger. A pointer moves as the adjustment button is turned. Just as the dial in the head produces the exact spray desired, so the indicator numerals on the paint valve plunger show the exact volume desired without the loss of time by testing. The operator, having found that a certain class of work is performed best when the indicator points to a certain figure, makes the proper adjustment before beginning to spray.

The new Milburn spray gun is known as Type EF. To enable users of the Type E gun to obtain the benefit of the improvements, the new dialed air control valve and the plunger have been made interchangeable, and can be inserted.

Mica Undercutter for Small Spaces

SAVING of the time necessary for taking down and assembling a generator or rotary converter is claimed for a new undercutter announced by the Ideal Commutator Dresser Company, Sycamore, Ill. This can be operated in a space only 3 in. wide. The machine is driven from a small electric motor through a flexible shaft. The motor can be furnished in any voltage desired. The shaft is at right angles to the arbor which carries the saw, the latter being driven by gears. A depth gage next to the milling cutter is placed at the bottom. A micrometer adjustable guide operates in the slot next to the one being cut.

Mica undercutter in position ready for slotting a commutator

Association Activities

American Association Nominations for 1928-29

RECOMMENDATIONS for officers for the American Electric Railway Association have been made by the nominating committee, of which Britton I. Budd is chairman. The following names have been placed in nomination:

For president, James P. Barnes, president Louisville Railway, Louisville, Ky.

For first vice-president, Paul Shoup, president Pacific Electric Railway, San Francisco, Cal.

For second vice-president, J. H. Hanna, president Capital Traction Company, Washington, D. C.

For third vice-president, C. E. Morgan, vice-president Brooklyn City Railroad, Brooklyn, N. Y.

For fourth vice-president, G. A. Richardson, vice-president Chicago Surface Lines, Chicago, Ill.

For treasurer, Barron Collier, president Barron G. Collier, Inc., New York, N. Y.

For Executive Committee: Operating members, three-year term: H. B. Potter, vice-president United Railways & Electric Company, Baltimore, Md.; W. A. Draper, president Cincinnati Street Railway, Cincinnati, Ohio.

Manufacturer members, three-year term: Carroll Burton, president Lorain Steel Company, Johnstown, Pa.; E. D. Kilburn, vice-president Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.; Wm. M. Wampler, president Ellcon Company, New York, N. Y.

Way and Structures

CONSIDERABLE routine work was disposed of and a number of interesting special committee reports were brought up for approval at the third and final meeting of the way and structures committee of the Engineering Association, held at association headquarters, New York City, on July 19. Members present were Chairman H. H. George, Vice-Chairman E. M. T. Ryder, C. A. Alden, W. G. Hulbert, J. R. McKay and C. A. Smith. The following special committee chairman also were present: W. R. Dunham, Jr., C. F. Gailor, Adrian Hughes, Jr., and W. W. Wysor.

Mr. Hughes submitted a tentative draft of the report of the special committee on bus garage design. The discontinuance of some of the subjects and the revision of the assignment of another were recommended. After a discussion of a few minor changes the report was approved.

Mr. Dunham called attention to the final report of the special committee on review of the Engineering Manual. The letter ballot on the revision of Manual section W-112-22 — specifications for low-carbon steel track bolts—which constitutes final action on this report, has not yet been completed.

Mr. Ryder submitted the report of the committee on special trackwork, but stated that the report had not yet been approved by the committee membership. In discussing the section of the report dealing with rules for the maintenance of electric switches, Mr. Wysor emphasized that the rules evidently covered only one type of switch operating mechanism, namely, the solenoid type, and at the suggestion of Mr. Hecker the heading of this subdivision of the report was changed accordingly.

A progress report of the special committee on foundations for special trackwork was submitted by L. A. Mitchell. Mr. Ryder called attention to the desirability of wording the report so as to eliminate references which might savor of an indorsement of any particular type of crossing and Mr. Mitchell agreed to take care of this.

The chairman read a report which had been forwarded by the special committee on track drainage and ballast, which was adopted.

Mr. Smith reported that the final meeting of the special committee on wood preservation had been held on July 17. He reviewed briefly a tentative draft of the report in which the recommendation was made that a considerable number of Manual sections covering wood preserving oils and wood treatment be covered by reference to similar specifications of other associations only. It was the opinion of the way and structures committee that it would be undesirable to make this change, as many association members do not have available the manuals of other associations containing their specifications, and that this recommendation should therefore not be approved.

Mr. Gailor stated that the special committee on arc welding had no written report to submit, but that new data were being developed. He added that co-operation with the American Welding Society was working out entirely satisfactory and that the joint committee had reached agreement on a number of subjects.

Mr. Wysor submitted a tentative draft of the special committee on rail corrugation, stating that it had been approved by thirteen out of the seventeen members. It was suggested that slight modification be made to clarify certain references to experimental track under observation.

The special committees on alloy steels, pavement, track construction, joint bus and railway terminals and track gage had no reports to make.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Aug. 16 **— Metropolitan Section, American Electric Railway Association, fourth annual outing, Luna Park, Coney Island, N. Y.**

Aug. 16-17 **— Wisconsin Utilities Association, Transportation Section, Sheboygan, Wis.**

Sept. 7**—Maryland Utilities Association, mid-year meeting, Braddock Hotel, Braddock Heights, Md.**

Sept. 7-8**—Central Electric Traffic Association, Potawatomi Inn, Angola, Ind.**

SEPT. 22-28, 1928

American Electric Railway Association, 47th annual convention and exhibit, Cleveland, Ohio.

Sept. 25 **— Central Electric Railway Master Mechanics' Association, Cleveland, Ohio.**

Oct. 1-5**—National Safety Council, safety congress, New York, N. Y.**

Oct. 8-12**—American Welding Society, fall meeting, Philadelphia, Pa.**

Oct. 24-25**—Public Utilities Association of West Virginia, annual meeting, Huntington, W. Va.**

Nov. 14-15**—Public Utilities Association of Virginia, Roanoke, Va.**

Jan. 23-25, 1929**—Electric Railway Association of Equipment Men, Southern Properties, Houston, Tex.**

Wisconsin Utilities Complete Program

ANNOUNCEMENT has been made of the following program for the meeting of the transportation section, Wisconsin Utilities Association, to be held in Sheboygan, Wis., Aug. 16 and 17:

THURSDAY, AUG. 16
9:30 a.m.

Address of Welcome, Mayor Herman Schuelke.

Response, C. R. Phenicie, president Wisconsin Utilities Association.

Chairman's address, J. H. Lucas, Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

"Making the Streets and Highways Safe for All the People," by J. W. Oliver, chairman accident prevention and insurance committee, Highwood, Ill.

"The Need of Standardizing Highway Crossing Protection," by Andrew R. McDonald, commissioner Railroad Commission of Wisconsin, Madison, Wis.

"Track and Overhead Problems," by F. G. Hibbard, Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

Digitized by Google

"Noise Research," by Silas B. Tobey, Menominee & Marinette Light & Traction Company, Menominee, Mich.

1:30 p.m.

LUNCHEON PROGRAM

Demonstration of psychological tests and explanation of their value in the selection of platform men, by W. J. McCarter, supervisor of training Milwaukee Electric Railway & Light Company, Milwaukee, Wis.

"Furnishing and Co-ordinating Transportation Services in Cities up to 50,000 Population," by L. P. Fessenden, district manager Wisconsin Power & Light Company, Sheboygan, Wis.

Discussion led by Nels C. Rasmussen, Wisconsin Valley Electric Company, Wausau, Wis., and Clyde L. Hedges, Mississippi Valley Public Service Company, La Crosse, Wis.

FRIDAY, AUG. 17

9:00 a.m.

"Air Brake Installation and Maintenance," by Kenneth Wilkins, student engineer Chicago, North Shore & Milwaukee Railroad, Highwood, Ill.

"Recent Developments in Lubrication Methods," by John S. Dean, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

"Electric Railway Service in the Eighties," by A. K. Ellis, vice-president Wisconsin Michigan Power Company, Appleton, Wis.

"Operating Results of Light-Weight Worm Drive City Car," by A. W. Baumgarten, division engineer Chicago & Joliet Electric Railway, Joliet, Ill.

1:00 p.m.

Luncheon speaker, Lucius S. Storrs, managing director American Electric Railway Association, New York, N. Y.

The annual dinner will be held on Thursday evening at 7 at Elkhart Lake, B. W. Arnold acting as master of ceremonies.

Ample provision has been made to entertain the ladies attending the convention, including motor trips, swimming and bridge. The delegates will be taken on a trip around Sheboygan and Kohler on Thursday afternoon, winding up at Elkhart Lake for golf and swimming.

Educational Program Announced

PLANS for a series of conferences to be held under the auspices of the Committee on Education of the American Electric Railway Association at the forthcoming convention at Cleveland, Sept. 22-28, 1928, have been announced. There will be two training courses, one for transportation department leaders, under the leadership of William A. Durgin, of the Commonwealth Edison Company, the other, for non-transportation men, to be conducted by Frank Cushman of the Federal Board for Vocational Education. Mr. Durgin's course will have for its principal objective the training of leaders who can help employees fit themselves for contact with the public; Mr. Cushman's course will be more along the line of training foreman conference leaders. Dr. A. J. Rowland, educational director, Milwaukee Electric Railway & Light Company, will have general oversight over both series of conferences.

The program is divided into six distinct elements, as follows:

1. Training course for conference leaders (transportation department).
2. Training course for conference leaders (non-transportation departments).
3. An educational luncheon conference under the leadership of Edward Dana, general manager Boston Elevated Railway, which will be one of the group of American Association luncheons. The discussion at this luncheon will center on the general subject of salesmanship in transportation.
4. Two informal luncheon conferences for personnel and educational directors, to afford an opportunity to talk over their every-day experiences and problems.
5. A dramatized lesson in safety, to be given by a dozen actual car and bus operators, as a part of the Transportation and Traffic Association program.
6. An educational exhibit.

GROUPS TO BE LIMITED

As the groups will necessarily be limited as to size, member companies will be permitted to enroll not more than one representative in each course. Accordingly, it is desired that men of the highest type be selected. Previous experience in teaching or the handling of conference work is not a necessary qualification, the principal aim being to secure an attendance of men who are deeply interested in the improvement of working conditions or the handling of public relation matters. A personnel director, a man engaged in service improvement, an employment superintendent, a member of the staff who has direct contact with large numbers of employees, in short, any employee who has displayed an interest in problems of human relationship is urged as the proper type of a person to send to the conferences. A limited number of invited guests may also attend.

As planned there will be five 4-hour morning sessions, running from Monday to Friday inclusive, from 8:30 a.m. to 12:30 p.m., supplemented by additional sessions in which actual demonstrations in conference leadership will be given.

COURSE FOR TRANSPORTATION DEPARTMENT MEN

This course will have for its primary object the training of leaders who can help their fellow platform men to fit themselves for contact with the public. It covers the entire phase of relations between platform men and the passenger, and is offered in the hope that it may have a favorable influence upon the attitude of the public toward electric railway trainmen in general. Emphasis will be placed upon the five major qualities or elements of individual service, namely:

1. Interest shown by the employee in the needs of the passenger.
2. Quality of information given passenger.
3. Speech used in conversation with passenger.
4. Politeness and tact.
5. Personal appearance.

This course, to be handled by Mr. Cushman, is to be along the line of training foremen to act as leaders in conference groups on their own properties. Instruction will cover the steps to be taken in the preparation for a conference, subjects to be discussed, and procedure to make the meetings of interest and value. It is expected that a considerable number of men with previous experience in these matters will be enrolled for this course and that the resulting discussions will bring forth much information of benefit to others in the class.

PRACTICAL MEN IN CHARGE

Mr. Cushman, who is to handle the group of non-transportation department men, assisted in conducting the course for training conference leaders at last year's convention, in which line of endeavor he has had a wide experience in connection with his work as chief of the industrial education service, Federal Board for Vocational Training, at Washington, D. C. Mr. Durgin, who will be in charge of the course for transportation men, is a former member of the Stone & Webster organization, and for the past three years has had direct charge of men using the conference method of training with large numbers of employees. In the conduct of the program as outlined Mr. Durgin expects to call to his assistance from time to time a number of men from the electric railway field who have had previous experience in work of this nature.

Engineering Nominations Made

IN ACCORDANCE with the provisions of the constitution of the American Electric Railway Engineering Association, its committee on nominations has presented the following names for consideration of the membership:

For president, Frank H. Miller vice-president and general manager Louisville Railway, Louisville, Ky.

For first vice-president, W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore, Baltimore, Md.

For second vice-president, L. D. Bale, superintendent of power Cleveland Railway, Cleveland, Ohio.

Third vice-president, Charles H. Jones, general manager Chicago, South Shore & South Bend Railroad, Michigan City, Ind.

For secretary-treasurer, J. W. Welsh, general secretary American Electric Railway Association.

For executive committee: P. V. C. See, superintendent of car equipment Northern Ohio Power & Light Company, Akron, Ohio; F. McVittie, electrical engineer New York State Railways, Rochester, N. Y.; E. M. T. Ryder, way engineer Third Avenue Railway System, New York, N. Y. and Howard George, superintendent of research Cleveland Railway, Cleveland, Ohio.

All the nominees have expressed their willingness to serve the association for the ensuing year, if elected.

News of the Industry

Arbitration on Eastern Massachusetts Completed

Arbitration hearings have been concluded at the State House in Boston on wages and working rules on the Eastern Massachusetts Street Railway system. The men are asking for a substantial increase in wages, without stipulating the specific amount desired, and they want certain concessions in the matter of discipline. The special arbitration board is composed of James J. Kerwin, of Lowell, who represents the general public and acts as chairman; Fred. A. Cummings, vice-president of the company, and James H. Vahey. Mr. Cummings reprerents the company and Mr. Vahey the carmen's union. These two men have acted in similar capacities for the company and for the union at several previous hearings. While Mr. Vahey acts both as arbitrator and counsel for the union, Mr. Cummings acts only as arbitrator for the company; Arthur G. Wadleigh, one of the public trustees, is serving also as counsel for the railway.

The hearings lasted from July 30 to Aug. 6, inclusive, and after the argument by counsel for both sides the board will take the case under advisement. The decision will be written by Mr. Kerwin and will be binding if one of the other arbitrators concurs in it.

Ten Cents and Ticket Rate in Schenectady

Permission was granted the Schenectady Railway, Schenectady, N. Y., by the Public Service Commission on Aug. 4 to increase its fares, fixing the rate at three tickets for 25 cents with a 10-cent cash fare in the city zone and an interurban zone rate of 10 cents, regular riders to be permitted to use tickets at the rate of 8⅓ cents per zone. The commission held that some form of a commutation fare should be established, and the company was directed to file a schedule with the commission which might become effective on three days' notice. The railway asked for a 10-cent cash fare. The present fare is 7 cents in Schenectady, with a like fare in its outside divisions. The commission says in part:

The showing of the company's operations is such, as fully demonstrated by the low return which it is now earning, that no question need arise as to the justification of its claims for relief. It is questionable, however, whether a general fare of 10 cents with no special consideration for regular riders will not unduly restrict car riding to an extent prejudicial to the company. The commission has taken this attitude in other cases, and in no important city thus far has a general rate of 10 cents per passenger been allowed.

The commission in its determination holds that approximately $11,000,000 represented a fair valuation of the property used and useful at the present time. It further held that under the results showing operations of the company it was not necessary to fix a valuation of the company's property now.

The city of Schenectady objected to the jurisdiction of the commission because of the franchises granted to the company. An application to the Supreme Court for a writ of prohibition against the commission was denied by Justice Cropsey last February.

The city later agreed that the commission should examine the books of the company for 1926 and 1927. This was done and copies of the commission's reports served on the city and the company. A conference then followed between Schenectady and the company whereby the company's petition was submitted to the commission for decision without taking further evidence.

St. Louis Survey Under Way

New board appears fully to recognize magnitude of problems before it. Committees preparing to report utilization of streets and improvement of service

MAYOR Victor J. Miller of St. Louis, Mo., has named Charles J. Eisenring, business agent for the Carpenters District Council, as a member of the newly organized Transportation Survey Commission. Mr. Eisenring was selected to represent the City Plan Commission on the commission.

E. J. Russell, chairman of the commission, is also a member of the City Plan Commission, but was named to the transportation board as a private citizen so that he could be elected its chairman.

In commenting on the duties of the new board Chairman Russell expressed the belief that it should not confine its work to the city, but should study transportation needs of a community twice as large, including St. Louis County and the district on the east side of the Mississippi River. He said in part:

The ordinance creating the commission requires it to study all forms of transportation for the present and the future. Air transportation, electric traction, motor vehicle, steam railway and river traffic are included in the scope of the work. A study of this kind, to be complete, must extend beyond the political boundaries of the city and should be for the metropolitan district which includes the city, portions of St. Louis County and of Madison and St. Clair Counties in Illinois. In order to make the work effective, the co-operation of the counties should be invited.

In St. Louis County the problem would be practically that of adequate highways; for Madison and St. Clair, mutually satisfactory locations for future bridges across the Mississippi River.

The commission should familiarize itself with the fundamental principles of adequate transportation facilities and should endeavor to approach as nearly as might be reasonably possible an ideal system.

Surveys have been made of the electric railway problem and the reports on them should be analyzed as they will save a great deal of time and it is unnecessary to duplicate the excellent work previously accomplished. Rapid transit is a phase of the problem because it involves new and costly construction if it takes the form of subways or elevated, or a combination of both.

If private ownership is decided upon, franchises need careful scrutiny. Financing of the cost of new construction and of its upkeep afterwards will have a bearing on the fares to be paid, and while they are established by the Public Service Commission, it will be influenced by the facts in the case.

Vehicular traffic covers passenger cars, trucks, buses, taxis and service cars. Are existing and contemplated streets adequate to serve the purpose? What is the answer for congested traffic intersections? An extension of one-way traffic streets may become necessary. Tourists should be provided with proper facilities for entering and leaving the district. Trucking is constantly on the increase and should largely be separated from passenger traffic.

In looking ahead for future needs, the commission might well bear in mind the fact that the population in the metropolitan district will double itself within 25 years, and the solution of the problem might well be based on this growth. This would seem reasonable in view of the strategic position of the district from a geographic and railroad standpoint, the ultimate development of the river traffic, the ability to coke the Illinois coal and the accessibility of an almost exhaustless supply of iron ore.

The survey should be made by competent and experienced men, selected only after mature deliberation. The work of the commission will be valueless unless it is sold to the citizens. Organizations and individuals should be invited to make suggestions. As the work advances the people should be informed of the progress.

He named two sub-committees, one to study and report on the utilization of the streets in the speeding up of traffic and the second to consider the improvement of surface street car service.

Director of Streets and Sewers Brooks informed the commission that four plans have been evolved that will eliminate about 10 miles of street car tracks and by adding 2½ miles of new tracks the service as a whole will be improved and cost of operation and maintenance reduced.

Digitized by Google

Samuel W. Greenland, representing the St. Louis Public Service Company, said that while St. Louis cannot complete subways for more than five or ten years, many improvements in down-town conditions can be made immediately. Some of these changes, such as one-way streets, would not require any alterations in the preesnt trackage, and would greatly speed up traffic in the congested areas.

Making Good Use of Obsolete Cars in Cincinnati

The Kiwanis Club of Cincinnati will sponsor erection of a machine shop and woodworking shop, together with school rooms, to be constructed out of old cars of the Cincinnati Street Railway at St. Edmund's Home for Boys in Glendale, a town near Cincinnati. Hudson R. Biery, Cincinnati, director of public relations of the railway, announced that the cars would be removed to Glendale for the purpose when taken out of service at the Winton shops of the company the week of Aug. 12. The cars were purchased for them by a friend of the boys' home.

Report Expected in Portsmouth

W. B. Brady, vice-president of the Portsmouth Public Service Company, Portsmouth, Ohio, is making a personal survey of conditions in that city prior to presenting a report to the owners of the company. In a statement Mr. Brady said that the company had been losing money for the last seven years and was now unable to finance any improvements. In fact, the situation was so bad that it was a question of how long operations could continue under the present conditions.

The Portsmouth City Council recently ordered the company to improve the streets along the company's tracks.

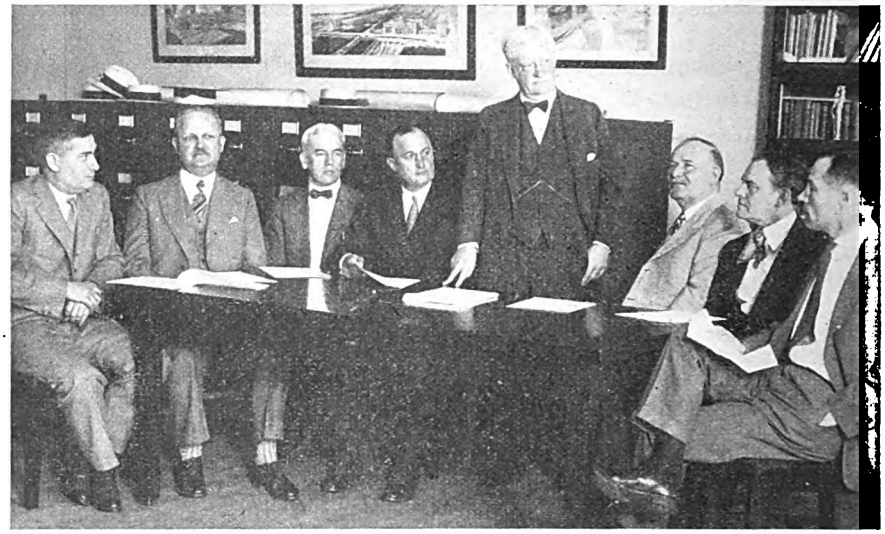
Catching the Frauds on Maryland Line

As a means of combatting those who make improper use of commutation books, the Washington, Baltimore & Annapolis Electric Railroad, with headquarters in Baltimore, Md., has started the rigid enforcement of a rule which provides that the commutation tickets be detached by the conductors. On every commutation book sold by the company on and after Aug. 1 appeared a sticker bearing the following: "Conductors have been instructed to personally detach coupons. Please, therefore, allow him to detach them."

The conductors were notified to refuse to accept tickets detached by the patrons. Should any be detached by the rider they must be properly stamped by an official. Numerous cases of improper use of the books have been reported, one conductor apprehending a patron who attempted to use tickets issued three years ago.

Subway a Real Civic Undertaking

Architects and engineers named on committee to plan proposed Chicago system. Assessment idea favored



—Courtesy of Chicago *Daily News*

In consultation: David H. Wallace, Harvey A. Fleming, C. M. Mock, Horatio B. Hackett, representing John A. Holabird; Ernest R. Graham, Michael J. Faherty, president of the board of local improvements; Benjamin H. Marshall and E. J. McIlraith.

LEADING architects and engineers have pledged Michael J. Faherty, president of the board of local improvements, active assistance in the drawing of architectural plans for a complete Chicago subway system and the drafting of the engineering specifications. As a result a committee of seven—three architects and four engineers—has been appointed to work out the general scheme for the subway. The committee is headed by Ernest R. Graham, architect. The other two architects appointed are John A. Holabird and Benjamin H. Marshall. The four engineers are Harvey A. Fleming of the south side lines; E. J. McIlraith, the Chicago Surface Lines; C. M. Mock of the elevated system and D. H. Wallace, city engineer.

Mr. Graham said the committee will determine what they believe the best general scheme for Chicago. Results will be compared with previous efforts.

The work of the committee will be started as quickly as possible, he said, and will not be confined to a State Street subway, but to a comprehensive system. When the members are ready to report they will notify Mr. Faherty and another conference will be called.

Mr. Faherty said that before actual work is started on so gigantic an enterprise as a subway "the plan of construction should be made not by any administration, board of local improvements or other local body but by a committee of competent and able men representing all of the groups interested, such as property owners, transportation companies and the city."

After informing those present that they were not called together to discuss whether a subway can be built by special assessment, Mr. Faherty explained how, in his judgment, a subway can be built out of the traction fund and at the same time permit that fund to remain intact and available for any other purpose that may arise. He said:

The city already has the money from which a subway can be built. We will say for the sake of argument that the first unit will cost $40,000,000 and we further say that 25 per cent of it will be public benefit and the other 75 per cent charged against the property in the assessed district, and we will say that the assessment for the first unit is to extend from 22d Street to North Avenue and from the lake to the river. We will say that $30,000,000 of this will come from the property owners and $2,000,000 as a public benefit to be paid by the general public.

This special assessment paper can be deposited with the comptroller and the law enables the comptroller to loan 100 per cent of it to the board of local improvements. When the board of local improvements deposits its special assessment paper with the comptroller it signs an agreement that when the assessments are paid by the property owners the money will be turned over to the comptroller and credited to the traction fund. In this way the traction fund will be secure, as it is not possible to lose a dollar in the assessed district and the money will be drawing 5 per cent interest.

The $10,000,000 that are the city's share of this improvement, known as a public benefit, should be treated like any other indebtedness of the city of Chicago, like building a fire department house or a bridge. This money would have to be paid out of a general bond issue submitted to the people for approval and then credited to the traction fund.

In this way, the contractor will not have to submit his special assessment paper to the banker and receive 94 to 97 cents on the dollar. When the contractor knows that cash will be paid and that he can pay for his material and labor in cash, we will get the best bids possible for the construction of a subway.

It is safe to say that at least 25 per cent of the assessment will be paid the first

Digitized by Google

year and possibly 50 per cent in two years. The money can then be used in the construction of another unit, and in that way the traction fund can be used and reused to construct subways and pay cash to the contractors.

Inasmuch as the banks are willing to take special-assessment and public-benefit paper, there is no reason why the traction fund cannot be used in this way. By doing this the traction fund, instead of being idle as it has been, will enable the city to utilize this fund for subways and at the same time allow it to remain intact and available for any other purpose that may arise. Borrowing from the traction fund is not anything new. It has been done frequently by the board of local improvements, with no loss to the fund and, I think, with great benefit.

As indicated in the JOURNAL for July 28, page 154, Mr. Faherty suggested that to determine the legality of building a subway by special assessment, a judge familiar with the special assessment law, might sit two hours a day, two or three times a week, for the next five months and listen to the city's attorneys argue that such action is legal.

Extension Over Detroit United Track

The utilization of Detroit United Lines tracks to some of the outlying districts is enabling the Department of Street Railways at Detroit, Mich., to weld the two systems into one composite structure, with a view to rendering a greater service to patrons residing in suburban localities.

A decided step in this direction was taken on July 29 when the Grand River car line was extended to Farmington, a distance of approximately 18 miles from the City Hall, Detroit, under an agreement entered into between the Department of Street Railways and the Detroit United Lines, whereby cars of the municipal railway operate over the D.U.L. tracks from the Seven-Mile Road to Farmington.

The coach service operated by the street railway to Farmington has been discontinued, but the coaches thus released will be utilized in other districts where service is planned by the department.

The new service to Farmington has many advantages over the old method. The all-rail line is more economical than the coach line since the tracks were already in location and the transmission system in order. Moreover, the service is more convenient than taking the street car to Seven-Mile Road and going thence to Farmington by coach, a route formerly traversed by many.

The tracks from the Seven-Mile Road to Farmington have been idle for more than two years, but under this new régime they ought to prove not only a boon to patrons, but a profitable enterprise as well. The new plan is believed to be an initial step in service to outlying communities that will, it is hoped, be more and more adequately served in the future, through the medium of Detroit United Lines tracks and the Department of Street Railway cars and coaches.

Review of Athol-Orange System

First municipally owned Massachusetts railway, a 7-mile road, appears to be doing well

THE first municipally owned street railway in Massachusetts, the Athol & Orange Transportation Area, is entering its fifth year with a remarkable record. In four years the Area has carried 200,000 school children without an accident. In 1927 not an accident claim of any kind was made against the railway. This is considered remarkable as it operates 7 miles of track over the Mohawk Trail, one of the heaviest travelled roads in the state.

George S. Donley, superintendent, believes safety comes first and service second. Safety and service, however, go hand in hand and service does not need to be sacrified to safety nor safety to service. A motorman would not think of letting a school pupil out in a whirl of auto traffic. If the need seems to warrant pupils are assisted on and off the cars. Safe stops are planned.

Two miles of new roadbed have been completed and work has been started on the rest between the two towns of Athol and Orange. New feed wires, bonds and switches are included in the program. The carhouse has been improved with a new stock room, car repair pit, paint room and minor improvements to facilitate handling of cars.

None of the large cars is new but they have the appearance of new cars. The car rehabilitation program has been an extensive one and will continue to be, Mr. Donley said. This long-term operation is considered exceptionally good as the cars run over hilly country, with several grades as severe as 15½ per cent. Hourly service is given on the main line except on Saturdays, when half-hour service is operated.

The Area was taken over by a vote of the town of Athol in 1923 and stands as only one of two roads taken over by towns since an act of the Legislature was passed, giving such authority. The road originally was the Athol & Orange Street Railway. Later when a loop connecting Springfield, Greenfield, Worcester and Fitchburg was planned it was taken over by the Northern Massachusetts Street Railway. When the last-named company went into receivership an order of the Supreme court was issued to close out. Actual operation under the town was begun on March 23, 1924, with Mr. Donley as superintendent. He had been a platform man beginning March 27, 1895, for the old Athol & Orange Street Railway, but took over the management of Brookside Park, an amusement resort in Athol in 1920.

The Area is operating with a 10-cent minimum fare, selling ten tokens for 50 cents. After the first zone, users of tokens pay one token for every zone thereafter. A half-rate issue is made for school children and the school tickets are recognized not only during school hours but through all hours of the day and during the summer. Interest has been paid regularly on the bonds. A small reserve is kept and the balance put back into equipment.

It is a watchword of the employees that people along the route can set their timepieces by the cars, since service is so near the dot.

A Mile an Hour Increase in Pittsburgh

Efforts are being made by the Pittsburgh Railways, Pittsburgh, Pa., to improve service by increasing the average speed to about 9½ m.p.h. The changes are represented as having been made practical at this time because the large number of company and public improvements have made for fewer delays and better operating conditions generally. Among the other contributing factors are more adequate power supply, at vital points, and the use of cars particularly suited to a given service.

Thomas Fitzgerald, vice-president of the Pittsburgh Railways, issued the following statement:

Our efforts may be described as an attempt to maintain and improve service in spite of a marked decrease in traffic and earnings. Additional adjustments will be necessary if we are to discharge our obligations to the city and other municipalities. In the event of improved earnings or operations, service will be improved accordingly. We certainly regret the necessity of adjusting operations and the number of employees to the seasonal traffic conditions and to decreased earnings.

The prompt movement of street cars in Pittsburgh has been slightly improved, so that we hope to make the average rate of speed 9½ m.p.h., less than a mile an hour increase. An increase in car speed has been made imperative by the demands of the car riders. If service is to keep pace with the improvement required by the public, cars must take them where they want to go within a reasonable time.

In the past congestion on Pittsburgh streets has slowed down the movements of trolleys considerably. Now that public and company improvements have in some measure relieved this, we hope to return the cars more nearly to the schedules formerly maintained. At one time the street car was the fastest moving vehicle on the streets. Now it is the slowest except for the horsed vehicle.

The car riders of Pittsburgh have provided, through the railways, more than $1,500,000 in improved power facilities; $4,500,000 in reconstructing the tracks of the railways, and about $5,000,000 in new cars—simply to improve operations and furnish a service adequate with the demands of the car riders. These expenditures have been made since 1924.

It is true that by Aug. 6, 220 of more than 2,900 trainmen will have been placed on the extra list—not 500. The present depression in business conditions—reflected in railway revenues—makes imperative not only improvements but economies, as has been the experiences of many businesses under similar conditions.

The improved schedules are based on careful observations of actual performances under present traffic conditions, with the factor of safety always in mind. Where schedules have been improved, the improvement in automobile as well as street car movement has been very noticeable.

Stimulating Sales on the Pacific Electric

D. W. Pontius, vice-president and general manager of the Pacific Electric Railway, Los Angeles, Cal., has announced a new form of monthly pass to to be sold at $13 to regular commuters in Long Beach, Wilmington, San Pedro, Alamitos Heights, Redondo Beach and El Segundo. The new tickets will be made permanent only if after a trial period of 3 months they are regarded as sufficiently popular to warrant their continuance.

Sold at a lower rate than the 60-ride commutation ticket book, the new pass is good for an unlimited amount of transportation for the purchaser and members of his family. It further effects a considerable saving to the user through the privilege carried with it of free transportation within the 5-cent zone of both the city selling point and Los Angeles. The pass is good for use only by one person at one time on any train.

Shorter Week Sought in Seattle

Nearly 1,400 employees of the Seattle Municipal Street Railway, Seattle, Wash., are concerned in a request for a week of 5½ days made to the City Council recently. The city can grant their petition without any considerable addition to the expense of operating the street car and bus service, W. E. Carpenter, secretary-treasurer of the railway employees' organization, declares He said that the street car and bus men were now getting only one day in eight off from work, which was not enough to give them the rest and relaxation that they should have.

The request for the shorter work-week was made in a communication to the City Council from local Division 587 of the Amalgamated Association. It urged upon the Council the fact that "there is nothing in which labor is more vitally interested than in fewer hours and fewer days of daily toil whereby are afforded leisure and recuperation and opportunity for the things that make life worth living."

Travelers Guide in New Jersey

"Where to Go and How to Get There," a pocket-size guide, is soon to be issued, showing bus and railway service between Newark, N. J., and all other points in that State, as well as important cities in New York, Pennsylvania, Delaware, Maryland, the District of Columbia and other nearby States with which there is direct communication.

The guide will be published monthly by Criterion Service, Inc., 1060 Broad Street, Newark. It will contain about 50 pages of timetable information arranged alphabetically by destinations. To insure accuracy and reliability the contents will be compiled and printed under the supervision of men of long experience in the transportation field. About 50,000 copies of each issue will be distributed free at the terminals of all lines centering in Newark, at hotels in the local territory and at designated places adjacent to heavy traffic points. In addition to the timetable data, pages will be devoted to shopping and amusement information. The first number will appear early in September.

Would Increase Fare on Jersey Line

The Cumberland Traction Company, operating between Bridgeton and Millville, N. J., has applied to the New Jersey Board of Public Utility Commissioners for permission to increase the rate of fare between the two towns from 35 to 45 cents. The line is 10 miles long.

South Shore Methods Attracts Riders

To induce summer riding the Chicago, South Shore & South Bend Railroad has put into effect a reduced week-end rate from South Bend to Chicago and return for $4 and $2 for children. This is only one of the features of the new summer services which includes half-hour service during week-ends between Chicago and Michigan City and eight new trains, several operating on extra fast time. The accompanying advertisement shows still another way by which the South Shore is making an effort to stimulate the use of its service. The service as advertised in the daily press is very effectively displayed in space 8x12 in. One of the Chicago agencies is handling the advertising account.

Two Bells in Los Angeles with Changed Appearance

In the opinion of officials of the Los Angeles Railway, Los Angeles, Cal., the time is now at hand for *Two Bells*, the weekly publication of the road's employees, to take its place with full-grown publications that are issued monthly. Accordingly, with a change in make-up but still serving as a herald of good-cheer and fellowship, the first of the new series will make its appearance on or about Sept. 10.

Rehearing in Stockton Denied

The California Railroad Commission has denied the petition of the City of Stockton for a rehearing of its recent order fixing the rates for the Stockton Electric Railroad. A one-way single cash fare of 7 cents between all points on the company's lines and four tokens for 25 cents were authorized by the commission.

Safety the Subject of Comment In the Society Column

The Chicago Surface Lines has broken into the society column of the Chicago *Tribune*. Madame X, after reviewing the safety banquet at the Stevens Hotel last May which was the subject of treatment in the JOURNAL, said that the awarding of the safety buttons "will mean more to you when you know that the Chicago street cars covered more than 136,000,000 miles last year with a 12½ per cent reduction in the number of accidents of the record of the previous year."

The commentator then continued as follows:

This is in spite of the fact that it has the world's highest speed average, which is 11 m.p.h., while the average elsewhere is 8 m.p.h. It has 1,070 miles of track, over which it runs 3,539 cars, carrying 892,000 revenue passengers a day, which is 500,000 more than all the rest of the railroads in the country carry in the same period of time. For three successive days at Christmas time last winter, every car owned by the surface lines was in continuous use. These cars carry many more passengers per diem than the elevated and bus lines put together. Eighteen thousand men are employed, of whom 12,000 are motormen and conductors. It is said to be the largest railway of its kind in the world, and the best run.

I got all this information from Guy Richardson, vice-president, and he gave the facts to me because of a remark made some time ago in this column that if we didn't get a subway by the world's fair year the city's transportation problem would be overloaded and break down. I'm glad I made the statement, as I had, thanks to John Chapman, a pleasant chat with Mr. Richardson, and learned much about the workings of our surface lines.

Nevertheless, I still think that if we don't enlarge our street railway traffic facilities we shall be swamped with the traveling public in 1933, or if not, it will be because people don't come to our world's fair.

The street railways officials say that their motormen all have to undergo each year a thorough examination for their fitness to drive a street car, and suggest that similar methods in dealing with drivers of the much more deadly and dangerous automobiles would do more to diminish our present appalling accident list than any speed laws and other inefficient regulations.

Madame X then went into the subject of the conditions imposed in other states, reciting the rigid requirements to be met before an operator's license is issued to the prospective applicant.

Increase in Detroit Municipal Fare Unlikely

Del A. Smith, general manager of the Detroit Municipal Railway, Detroit, Mich., addressed members of the U. and I. Club at luncheon in the Detroit-Leland Hotel recently as follows:

We are extremely confident of continuing with the present 6-cent fare. When we took over the D. U. R. lines in 1922 we were indebted to the extent of $42,000,000. That debt will be wiped out in 1931 and thereafter we will enjoy a $2,000,000 annual increase in the net income of the D. S. R.

Digitized by Google

Believing that "a stitch in time saves nine," we are now repaving and laying new tracks on many lines of the city. For four years following the acquisition of the system by the city the railway lines were merely patched. At the end of that period we found ourselves exactly in the same place that we started. A year and a half ago we started to concentrate on the main lines. Jefferson Avenue is now completed at a cost of $180,000 and will not need attention for at least ten years.

Instead of repairing trolley wires after they are broken, we now inspect them regularly and when one shows signs of wear it is immediately replaced. When we took over the lines, the number of such delays averaged 80 per month. So far this month we have experienced only one break which delayed the car 18 minutes.

The Detroit railway system is today valued at $60,000,000, a gain since 1922 of $28,000,000.

Public Speaking Important Branch of North Shore Line

The North Shore Line Public Speaking Clubs, sponsored by the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., filled 132 engagements during the second quarter of 1928 and spoke before an aggregate audience of 15,942 persons. The period was one of the most active in the history of the organization. The clubs took a prominent part in the safety campaigns conducted in their territory. Their work in this connection brought a letter of commendation from G. F. Loomis, superintendent of schools in Kenosha, Wis.

Defends One-Man Car System for Cincinnati

In connection with recent complaints to the Cincinnati City Council against the use of one-man cars on a certain Cincinnati line, E. D. Gilman, municipal utilities director, stated on Aug. 6 that he had received a report from Kansas City showing that that city now uses nothing but one-man cars, permitting a saving of about $500,000 annually in cost of operation compared with the two-man system. Mr. Gilman pointing out that both Cincinnati and Kansas City were hilly cities and that conditions were therefore comparable, further observed that all savings on operating costs in Cincinnati would be put back into improvements under the service-at-cost arrangement.

The Personal Element in Richmond

The Virginia Electric & Power Company, Richmond, Va., recently instituted the custom of carrying the name of each street car and bus operator in big letters on a card inserted in the front of the fare box. The custom is designed to assist the passenger in identifying the operator and to add a personal touch which, it is believed, will work for better service on the part of the employees and promote friendly relations between the riders and the company.

Recent Bus Developments

From Kalamazoo to Grand Rapids by Bus

Kit F. Clardy, assistant attorney-general of Michigan, and Charles B. W. Aldrich, assistant United States attorney, representing the Michigan Public Utilities Commission and the Interstate Commerce Commission, respectively, have attacked the proposal to abandon the western division of the Michigan Railway in briefs filed in United States district court.

Mr. Clardy maintained that the federal court has no authority to issue an order permitting the abandonment of the line. Mr. Aldrich said that as the company has interstate connections, the question rests with the Interstate Commerce Commission. The matter of state jurisdiction also was stressed.

Mr. Aldrich also said if the United States court holds it has the right to decide the abandonment question, it will open the door to breaking down the power held by the Interstate Commerce Commission in settling questions of interstate transportation. The Public Utilities Commission, maintaining the constitutional rights of Michigan in the question, says it is best qualified to pass on the matter.

The western division runs from Kalamazoo to Grand Rapids and from Allegan to Battle Creek. There is a spur from Battle Creek to Camp Custer. The company, in its petition sought to abandon the division. Its plea was made through John F. Collins, of Jackson, receiver. The company offered to run buses over the route of the electric lines.

Permit Would Jeopardize Existing Services in Missouri

The Missouri Public Service Commission on Aug. 1 denied the Egyptian Transportation System of Marion, Ill., a certificate of convenience and necessity for the operation of buses between down-town St. Louis and Kirkwood. Last February the company applied for the bus permit and final hearing was held by the commission on April 11.

Besides steam railroad protestations the St. Louis Public Service Company also entered the case, since this bus competition affected its railway lines from St. Louis to Maplewood, Webster Groves and Kirkwood.

Barney W. Frauenthal, general traffic manager for the railway, testified the bus route paralleled the railway and duplicated its service. He also stated that after 6 p.m. the St. Louis Public Service Company supplied the only public transportation to this territory and that if the heavy peak traffic of the morning and evening were taken away from the car line its revenue would continue to be depleted. He said that the line from St. Louis to Kirkwood had not shown a profit in eight years.

The state commission ruled that to grant the permit sought by the bus company would be inequitable and unjust to the electric railway and to the Missouri Pacific and the St. Louis & San Francisco Railroads.

Mid-State Coach Lines to Be Sold

Equipment of the Mid-State Coach Lines, Inc., Syracuse, N. Y., will be sold at public auction on Aug. 15 by R. S. Messenger, Auburn, receiver of the company. The equipment includes ten of the 21-passenger buses, five trucks, three buses, two for seventeen passengers and one for twenty-nine; two automobiles, a truck and snowplow attachment, garage tools, equipment and supplies. The sale will include permission to operate buses in Syracuse and several towns in Onondaga and Oswego Counties subject to the approval of the Public Service Commission. The Rochester & Syracuse Railroad, the Empire State Railroad, the Auburn & Syracuse Electric Railroad, and the Syracuse Northern Electric Railway, Inc., are all interested in the coach company.

New Plan in Knoxville to Go Before Council

The appearance of S. A. Markel, chairman of the legislative committee of the American Automobile Association in Knoxville, Tenn., led the Knoxville *News Sentinel* to associate his name with the group of engineers who are making a survey of the new routes proposed by the Knoxville Rapid Transit Company, which is petitioning the City Council for a franchise to operate an independent bus system in that city. The new system is a revision of the ten-route plan laid out by Earl O. Mills, engineer for Bartholomew & Associates, and proposes eight instead of the former ten routes.

Meanwhile, no action has been taken by the City Council on the proposition advanced by the Knoxville Power & Light Company for the operation of buses in co-ordination with street cars.

Seeks Permission to Run Buses on Jersey Line

The Public Service Railway, Newark, N. J., has asked the City Commission of Bordentown, N. J., for permission to run buses through that town in connection with the already established railway lines. The company intends to operate the buses on a regular schedule there, articulating the service with that of the railway. Action on the matter was laid over.

Financial and Corporate

Augusta System to Pass to Southeastern Power

An offer was made recently by the Southeastern Securities Company, through which it is expected the company will acquire control of the Augusta-Aiken Railway & Electric Corporation. This will mean that the Augusta Company will become a part of the group of operating companies controlled by the Southeastern Power & Light Company.

The plan is to co-ordinate the operation of the Augusta-Aiken company with that of Georgia Power Company in Georgia, and South Carolina Power Company in South Carolina, and with the interconnecting system of the Southeastern Power & Light Company, extending through Alabama and Georgia. There is an electric transmission line connection at the present time, but the full benefits are not realized under separate control.

F. Bayard Culley, general manager of the Augusta-Aiken Company, issued a statement in which he said in part:

For the past two years the Augusta Company has been connected with the interconnected transmission lines of the Southeastern and has enjoyed the benefits of this association through the Georgia Power Company. However, this relationship has been in the nature of a buyer of power. It it true that all of our power requirements have been met by the Atlanta Company, but still we were simply a customer.

For the future we are a part of that system which now occupies the greater part of the State of Georgia and which is connected with the power resources of the State of Alabama, largely centered around Muscle Shoals. These connections with the large producing companies of the Southeastern System assure for us an unlimited supply of power for the territory served by the Augusta-Aiken Company.

In addition to all this, we will be directly connected with the $20,000,000 power project to be constructed on the Savannah River above our Stevens Creek Power Development.

I anticipate that the acquisition of the Augusta-Aiken Railway & Electric Corporation by the Southeastern Power & Light Company will be of value to the patrons of the company and to its employees.

St. Paul Southern to Be Resold

Judge Albert Johnson of Dakota County, Hastings, Minn., has ordered resale of the St. Paul Southern Railway. Operation of the road was discontinued July 31 pending a decision as to who bought the line at a previous sale. C. Rieger of St. Paul bid $30,250 and was awarded the line by the receiver, C. P. Kuckler. C. A. Davis of Minneapolis said he did not hear the receiver's acceptance and bid $30,750. Meanwhile the Minnesota Railroad & Warehouse Commission will have a hearing Aug. 13 in St. Paul upon application of the receiver to abandon the line. He said it is the plan of either purchaser to junk the road.

Automobile travel and bus transportation have cut down receipts of the line. The road has lost money since 1923 and has been operated by a receiver since Sept. 28, 1918. It was built in 1914 at a cost of $600,000 and operates 18 miles of track. Bus lines now operate five round trips to Hastings.

Separate Report on Railway Operations in Havana

As a result of the general economic condition and of bus competition, the earnings of the Havana Electric Railway, Havana, Cuba, have been seriously affected, and a policy of rigid economy was undertaken during 1927. However, care was taken that the economies introduced were not at the expense of the physical condition of the property, nor in any manner prejudicial to the proper upkeep. Thus does F. Steinhart, president, in the annual report explain the trying situation in Cuba.

The report of operations of the company shown in the accompanying statements covers the period from Sept. 1, 1926 (the date on which it began to function independently of the Havana Electric Railway, Light & Power Company) to Dec. 31, 1927 and as the calendar year has been adopted as standard by the company, a financial statement is contained for the calendar year 1927.

The Havana Electric Railway as now organized operates the tramway system in Havana, together with the interurban line known as the Insular Railway, and also the tramway systems in Santiago and Camaguey, all on the island of Cuba. The number of passengers carried in 1927 was 115,712,035. During the year, approximately 800 buses were operated in the city of Havana and adjoining districts in competition with the railway. Passengers are carried for 5 cents from and to these outlying districts. The result has been that many riders are now being brought into Havana by the buses for 5 cents who would normally have been delivered to the railway at the terminals by the buses acting as feeders.

RESULTS OF OPERATION OF THE HAVANA ELECTRIC RAILWAY

	Four Months Ended Dec. 31, 1926	Year 1927	Total
Gross operating revenues	$2,116,285	$6,020,679	$8,136,965
Operating expenses including taxes	1,690,172	4,814,609	6,504,781
Net revenues from operation	$426,112	$1,206,070	$1,632,183
Net non-operating revenues	11,564	52,264	63,828
Gross corporate income	$437,676	$1,258,335	$1,696,012
Interest and other charges	214,637	643,893	858,530
Net divisible income	$223,039	$614,442	$837,481
Out of the net divisible income for the period under review, namely			$837,481
There has been set aside as depreciation reserve			128,000
Leaving a balance of			$709,481
The following disposition was made thereof:			
Dividends paid during the period on the preferred stock (at the rate of 6 per cent per annum)			$375,000
Balance carried forward			334,481
Total			$709,481

HAVANA ELECTRIC RAILWAY

	Four Months Ended Dec. 31, 1926	Year 1927	Total
Gross receipts from all sources	$2,127,849	$6,072,944	$8,200,793
Total deductions for operation, maintenance and accrued taxes	1,690,172	4,814,609	6,504,781
Net additions to property account	21,487	135,806	157,293
Total number of railway passengers carried	40,970,603	115,712,035	156,682,638
Passenger car-miles	7,004,815	21,521,652	28,526,467

Cites Lack of Municipal Railway Program

Considerable space is given by M. M. O'Shaughnessy, city engineer of San Francisco, to the electric railway situation in that city, in his report for the year ended June 30, 1927, just issued. Thus he calls attention again, as in the report for the previous year, to lack of any city plan of action when the franchises of the Market Street Railway expire. He urges the appropriation of money by the city to permit the Department of Public Works to make a study of the situation. Nothing has been done either, he says, as to any policy of acquiring the California Street System, although the franchises of that company expire February, 1929.

Referring to the Municipal Railway, Mr. O'Shaughnessy says that no extensions were made to it during the past year, and none can be made from surplus funds derived from the operation of the line, as in the past, because for some years there has been no surplus. For the year ended June 30, 1927, the operating ratio of the municipal line was 84.7 per cent, leaving a margin of only approximately 15 per cent to cover interest charges, depreciation, and other items. The suggestion of the city engineer, made March 31, 1927, for a $4,700,000 bond issue for extensions, new cars, buses, shops, etc., was denied at an election held in June, 1927.

Six buses used for giving service on the Embarcadero Line were run at a loss of about $18,000 a year. This loss, however, will be covered by a subsidy from the Harbor Commission, which is interested in keeping this line in operation. Altogether 19 buses are now in use, but garage facilities for them are greatly needed. During the year ended June 30, 1927, 15 new elec-

Digitized by Google

tric cars were put in service. They cost $18,316 each compared with $7,000 for almost the same type of car bought in 1914. The document in which Mr. O'Shaughnessy's comments are contained is the regular report of the bureau of engineering, a 104-page booklet adequately illustrated.

Indiana Merger Approved by Stockholders

Approval of the proposed merger of the Terre Haute, Indianapolis & Eastern Traction Company and the Central Indiana Power Company was voted at a meeting of the stockholders at Indianapolis on Aug. 1. Similar action was taken at a meeting of the stockholders of the Terre Haute Traction & Light Company, the traction subsidiary.

The consolidated properties will be known as the Indiana Electric Corporation and in it the Insull interests will participate. The railway lines have been controlled by the Randal Morgan interests, of Philadelphia, since their construction. They include more than 450 miles of tracks crossing the state from Richmond on the east to Terre Haute on the west. The company also has lines from Indianapolis to Martinsville and Crawfordsville and a leased line from Indianapolis to Lafayette.

The Public Service Commission will be asked to approve the merger.

A resolution permitting the sale of the Eastern Division of the railway, to a separate corporation was adopted at the meeting.

The merger has been the subject of detailed analysis previously in ELECTRIC RAILWAY JOURNAL.

Abandonment Allowed in Sherrill

The Public Service Commission on Aug. 1 approved a declaration of abandonment by the New York State Railways of 11.2 miles of its system in Sherrill. Approval is conditioned upon forthwith removal of track and structures from the highway and restoring the highway for traffic.

Service has been discontinued since Aug. 29, 1927, hourly bus service now being given, connecting Sherrill, Kenwood and Oneida.

Dividends Passed by New Bedford Company

Directors of the Union Street Railway, New Bedford, Mass., on July 19 passed the dividend due to be paid on Aug. 1. Quarterly dividends of $1.50 a share have been paid on the stock since the beginning of 1926. Prior to that 8 per cent annually was paid. In commenting on the action of the directors, E. S. Wilde, president, said that "owing to the local textile situation during the last quarter patronage has decreased to such an extent that the company has not earned its dividend."

Progress in Buffalo

Tangible evidence that rehabilitation work of Mitten Management on International Railway is bearing fruit. Employees increase their holdings of company securities

CONTINUED improvement in the financial position of the International Railway, Buffalo, N. Y., under Mitten Management is shown by the semi-annual income account reproduced in ELECTRIC RAILWAY JOURNAL for Aug. 4. For the first six months of this year the company earned $240,031, compared with a deficit of $176,271 for the similar period last year. Operating revenue was $5,538,871 compared with $5,423,725 for the similar period last year, while there was a decrease in expenses and taxes from $4,901,174 last year to $4,637,947 this year.

The statement reflects the benefit of recent financial changes authorized by the Public Service Commission, since the 1927 figures include an amortization charge of $167,879 discontinued on Jan. 1, 1928. The figures indicate that the improvement is due in part to an increase of $115,000 in passenger revenue, and in part to greater economies and efficiencies.

After the meeting of the board of directors B. J. Yungbluth, president, announced that the equity of holders of I.R.C. 5 per cent refunding and improvement gold mortgage bonds is being substantially improved through the retirement this year of six issues of underlying bonds. Holders of these bonds totaling $600,000 have taken in exchange I.R.C. preferred stock, a $2,000,000 issue of which was recently authorized by the Public Service Commission. The bonds retired in this manner include $60,000 Tonawanda Street Railway, $12,000 Niagara Falls, Whirlpool & Northern Railway, $488,000 Niagara Falls & Suspension Bridge Railway and $40,000 Tonawanda Electric Railway. In addition, through the operation of a sinking fund under the I.R.C. mortgage, $300,000 underlying bonds of the Niagara Falls & Suspension Bridge Company and of the Clifton Suspension Bridge Company have been retired at maturity, while $125,000 bonds of the Lewiston Connecting Bridge Company and the Queenston Heights Bridge Company will be similarly retired at maturity on Oct. 1. Last year $215,000 of Buffalo, Bellevue & Lancaster Railway bonds were also retired. As of June 30, 1928, there was outstanding only $8,432,000 of underlying bonds.

Of the $2,000,000 issue of 7 per cent preferred stock authorized by the Public Service Commission to replace temporary financing with permanent financing, and to reimburse the treasury for capital expenditures, $1,600,000 has been sold. Dividends as declared are payable on Sept. 1 and March 1. Since the stock was issued May 1, the directors on Aug. 1 declared an initial dividend for four months of 2⅓ per cent, payable on Sept. 1 to stock of record Aug. 20. No dividend has been paid on the common stock since 1918. Under Mitten Management, however, operating deficits have been steadily reduced, and for the last two years the company has shown a net income.

In commenting on the improvement of the I.R.C. financial position President Yungbluth said in part:

The transition from a loss to a gain has benefited the public, the employees and the owners. Resulting improvement in the company's credit has made possible many service betterments. I.R.C. service today is substantially better than Public Service Commission requirements. In spite of crowded streets, more than 90 per cent of I.R.C. cars are on time. The cars are in better condition, cleaner, and better painted than ever before. Last year and this year track and paving maintenance and reconstruction expenditures have totaled $1,425,000. Improvements have been so marked that recent advertising of Buffalo's advantages as a site for industry has made mention of the excellent transit service available.

The employees who now own 11 per cent of the common stock, 2,000 shares of the preferred and $550,000 par value of I.R.C. bonds have been benefited by steady increases in market value of their holdings and in the security behind their equity, while the other owners of the property who are waiting and have been waiting since 1918 for dividends on their common stock have also benefited by the improved market value of their securities.

The splendid improvement in the relations involving the city, the public and the company has resulted in the development of a fuller understanding of the fact that to give good service the company must be in sound financial condition. As the spirit of co-operation among the city, the public and the company continues to grow, the advantages already secured will become even more generally recognized that Buffalo and the Niagara frontier have the best transit service in New York State.

$309,403 Available in Sacramento for Surplus

The Sacramento Northern Railway, Sacramento, Cal., reports to the Railroad Commission its 1927 operating revenue at $1,541,605, compared with $1,569,482 for 1926. Operating expenses, excluding taxes for 1927, are $1,190,080 and $1,181,297 for 1926, leaving a net operating revenue of $351,525 for 1927, and $388,185 for 1926. During 1927 taxes charged to operation amounted to $101,618, and for 1926 to $81,824. Deducting the taxes leaves operating income of $249,906 for 1927 and $306,361 for 1926. Adding to the operating income, the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, available for fixed charges, non-operating expenses, dividends and surplus of $309,403 for 1927 and $350,663 for 1926.

Would Sell California Property

The San Francisco-Sacramento Railroad has applied to the California Railroad Commission for authority to sell its railroad properties to the Sacramento Northern Railway, and the latter has applied for authority to purchase the same. The consideration named in the purchase agreement to be paid for the property is $1,675,100, the property to be delivered free from encumbrance. Lines involved include one between the city of Oakland and the city of Sacramento and a branch from West Pittsburg to Pittsburg, in Contra Costa County; the former comprises 84.8 and the latter 2.28 miles.

Asks to Abandon Branch Line in Oregon

The Oregon Electric Railway on July 31 requested permission from the Interstate Commerce Commission to abandon operation of a branch line extending from West Woodburn, Ore., a distance of 2.3 miles. According to the applicant in 1926 it substituted stage service upon an adjacent highway for railroad passenger service but the revenue from the stage line has been substantially less than cost of operation. The applicant states that the city of Woodburn and adjacent territory is adequately served by its main line and the main line of the Southern Pacific Company.

Fewer Directors in Cortland

A certificate was filed recently with the secretary of state at Albany, reducing the number of directors of the Cortland County Traction Company, Cortland, N. Y., from eleven to nine. The board of directors consists of C. H. Churchill, G. H. Garrison, Albert Haskell, Jr., Charles S. Ruffner, Paul D. Weakers, J. D. Whittemore, C. G. Wickwire, R. C. Brewer, and A. N. Woodhead.

Authorized Returns Not Earned in Kansas City

The operating statement of the Kansas City Public Service Company, Kansas City, Mo., for June shows receipts from railway fares were $680,629. This sum represents 9,158,986 cash fares, the average fare being 7.43 cents. The total number of passengers carried was 13,881,785 and the average fare per passenger 4.90 cents. Bus fares totaled $36,211. Bus passengers numbered 323,102, at an average fare of 11.21 cents. The actual cost of transporting each passenger was substantially in excess of this sum. Total receipts for the month from all sources were $751,651. Total June charges were $669,083, leaving the excess of receipts over charges $52,568. This is only 52.74 per cent of the sum the company was authorized to earn under the terms of the franchise. For the first six months of 1928 the company was authorized to earn $663,188 after operating expenses, taxes, and fixed charges, but actually earned $416,204, or 62.76 per cent of the authorized amount.

Strain on Seattle's Finances

At a recent conference at which Mayor Frank E. Edwards and members of the City Council were present, Roy E. Furse, acting superintendent of the Seattle Municipal Street Railway, issued a warning that severe financial strains loom for the railway during the next five years when bond redemption requirements reach their peak. He says steps for an adequate financial program cannot be safely delayed. The conference was held to discuss plans for rehabilitation of the system. Mr. Furse advocated a bond issue of $4,000,000 or $5,000,000 for local subscription, to finance the purchase of new cars, the reconstruction of existing tracks and other necessary improvements.

Traffic, Fare and Wage Figures

The number of revenue passengers, including bus passengers, reported by 215 companies to the American Electric Railway Association for June, 1928, compared with June, 1927, is as follows:

June, 1928	793,596,077
June, 1927	801,411,345
Decrease, per cent	0.98

The percentage decrease in June is slightly greater than that reported for May. One reason for this is that there were several rainy week-ends in the large cities in the eastern and middle western sections of the country which materially reduced the amount of traffic to the pleasure resorts, which are usually crowded on Saturdays and Sundays. Otherwise there does not seem to have been any fundamental change in the traffic situation throughout the country.

Average cash fare in cities of 25,000 population and over were

	Cents
July 1, 1928	8.1728
June 1, 1928	8.1457
July 1, 1927	7.9752

The rise in the average fare was due to an increase from 6 cents to 10 cents in Galveston, Texas, and an increase from 7 cents to 10 cents in Savannah, Ga. With these two changes added there are now 239 cities in the United States having a cash fare of 10 cents. Of these, 122 cities have a population of 25,000 or more.

The average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate Cents	Index Number 1913=100 Per Cent
July 1, 1928	57.48	210.94
June 1, 1928	57.44	210.79
July 1, 1927	57.20	209.91

Net Lower in Indianapolis

Gross earnings of the Indianapolis Street Railway, Indianapolis, Ind., for the six months ended June 30, 1928, showed a decrease of $92,349 from the corresponding period of 1927. Gross for 1928 was $2,794,017, compared with $2,701,667 a year ago. Net increased from $622,920 to $702,433, a gain of $79,512, but the six-month deficit was $19,602. With a June deficit of $55,851 the total deficit carried by the company to July 1, 1928, was $933,353.

Fewer Passengers in St. Louis

A 3,256,669 decrease in passengers during the first six months of 1928 compared with the similar period in 1927 is shown by the reports filed by the St. Louis Public Service Company with the city. In the quarter ended June 30 the company carried 60,763,736 cash passengers, using an average of 1,358 cars on week days, 1,172 on Saturdays and 618 on Sundays. In the similar period last year 62,761,114 passengers were hauled, 1,368 cars used on week days, 1,181 on Saturdays and 653 on Sundays. In the six months' period the total number of passengers was 122,876,154 against 126,132,823 in the first six months of 1927. The decrease was 1,259,291 in the first quarter and 1,997,378 in the second quarter.

Loss Described on Maine Road

At a recent hearing the Maine Public Utilities Commission listened to arguments in favor of the Androscoggin & Kennebec Railway abandoning service on its 14-mile line between Augusta and Winthrop, via Lake Cobbosseecontee and Lake Maranacook. Congressman John E. Nelson, acting for the railway, said that the line had been operating 26 years, that revenues for the first six months of 1927 were $515,486, and $451,209 for the 1928 period.

Referring to the popular idea that the Augusta division as a unit was profitable he said that making proper allowance for depreciation, this division in 1927 showed no profit over and above the $21,000 required for bond interest.

Approves Costs at Los Angeles

The Harbor Commission at Los Angeles, Cal., has approved the recommendation of Harbor Controller Edwards that $2,800,000 of harbor improvements bonds be sold to meet the costs of the proposed railroad classification yard and for one year's normal construction work at the port.

Signed certificates from the Santa Fe, Union Pacific, Pacific Electric and Southern Pacific railroads, all parties with the city in the agreement for unified operation of the Los Angeles Belt Line Railway at the harbor, have been turned over to the Harbor Commission. The certificates authorize execution of the agreement.

Book Reviews

Lineman's Handbook

By Edwin Kurtz, M.S., E.E., professor of electrical engineering and head of department, Oklahoma Agricultural and Mechanical College, formerly member of educational department, Milwaukee Electric Railway & Light Company. Published by the McGraw-Hill Book Company, Inc., New York. 548 pages. Price $4.

Sections of particular interest to electric railway men in this handbook deal with pole line construction, power line erection and inspection, testing and maintenance. To give the reader a perspective of electric systems, chapters are introduced on elementary electrical principles and on the electric system. There are four chapters dealing with line material, equipment, protective equipment and line control equipment. Chapter VIII is a simple treatment of the factors governing line design. There is a comprehensive treatment of first-aid. The book concludes with a reprint of the accident prevention course for linemen.

The chapter on pole line erection includes sections on laying out the line, framing poles, erecting poles, setting poles, pole climbing, mounting crossarms, and concludes with some tables on the tensions in hard and medium-drawn bare copper wire for different span lengths. Several pages are given to the subject of power line erection. The chapter on inspection, testing and maintenance gives usual methods. It is well illustrated.

Die Selhsttatige Signalanlage der Berliner Hoch und Undergrundbahn.

By Alfred Bethe, chief engineer of the Berlin Elevated Railways, with a foreword by Dr. Kemmann. Published by Julius Springer, Berlin. 164 pages, 14 charts, illustrated. Price, 32 reichsmarks.

This is a very complete description of the automatic block signal system of the Berlin Elevated and Subway Lines. Former methods of block signaling are treated briefly, and the latest installations are considered in great detail. Complete wiring diagrams are given. The automatic train stop is also considered, and charts are included showing how it is adjusted to the schedule of the railway lines.

McGraw Electric Railway Directory—1928

Published by McGraw-Hill Catalog & Directory, Inc., New York. 256 pages. Price $10.

As a reliable guide to technical and operating conditions in the electric railway field this new edition of the McGraw Electric Railway Directory will be of invaluable service to operators and manufacturers. This up-to-the-minute survey covers geographic, managerial, equipment, track, shop and bus data on 741 operating companies and sixteen municipal railway properties. It also lists 122 holding companies, whose properties are located in the United States and its possessions, Canada, Newfoundland, Central America and the West Indies.

The names of 5,271 officials are given under the main office of their companies with a notation of the individual's local headquarters. As in former years, an index to electric railway companies is included with heavy black stars indicating holding companies. In addition, this year's directory contains an index to motor bus subsidiaries operated by electric railways. The contents also cover information on utility associations and national and state commissions.

The first issue of Electric Railway Directory appeared in 1884 with the first issue of the paper. It has been published continuously ever since.

Safety and Production

A report by the American Engineering Council. Published by Harper & Brothers, New York. 414 pages. Price $5.

In this volume, a representative committee of American executives has set forth its recommendations and findings about safety work today and its relation to high productivity. The book contains a complete picture, with results graphically shown, of safety and production conditions in seventeen major industries intensively studied. Sixty products groups in twenty basic industries were studied, and the experience of 14,000 American plants—with 2,500,000 workers and 54,000,000,000 man-hours of work—has been here recorded.

The American Electric Railway Association supplied the accident and production statistics from 1920 to 1926 for 172 electric railway systems involving 55,781 trainmen. These companies, in 1925, operated 860,576,318 car-miles and carried 5,926,032,087 passengers. In computing accidents rates, the association used the number of accidents per car-miles operated.

The passengers carried per car-mile and the car-miles operated per mile of track have been used as units of measurement for production rates. The rate based upon passengers carried per car-mile operated is an accurate measure of the density of traffic, which is also a factor affecting the number of accidents. The rate based upon the number of car-miles operated per mile of track is an adequate measure of the service rendered.

While apparently little change has taken place in the production rate of this group of electric railways, there has been a very uniform improvement in the rate of accidents to employees. From 1920 to 1925 there has been an over-all increase in the cost of accidents; but in more recent years the cost shows a downward trend.

Employees Stock Purchase Plan in the United States

Published by the National Industrial Conference Board, Inc., New York, N. Y., 245 pages. Price, $2.50.

This volume is the result of an investigation, conducted by Margaret L. Stecker, under the supervision of the Board's Staff Economic Council, of the movement in the United States toward increased holding by workers of the securities of the corporations by which they are employed. The investigation was based on data secured from 389 companies.

The first chapter describes various plans whereby employees may secure the individual and exclusive ownership of stock, bonds or other securities of their companies through cash purchase or on some form of partial payment basis. It also treats of the extent of employee stock ownership in the United States in 1927. Details of various stock purchase plans are next considered.

Other chapters discuss various problems which come up in connection with the operation of stock purchase plans and the benefits of employee stock sales to the company and to the employee. As a disadvantage, the risk of the investment is pointed out, as well as the means taken by some companies of eliminating this disadvantage. Three appendices describe the stock purchase plans of six large corporations, list companies which had or have had stock acquisition plans for their employees and recite the story of some stock subscriptions.

Code for Electricity Meters

Published by the National Electric Light Association, New York, N. Y. 122 pages.

This is the third edition of the code for electricity meters prepared by a sectional committee according to the procedure of the American Engineering Standards Committee under the joint sponsorship of the Association of Edison Illuminating Companies, the National Electric Light Association, and the United States Bureau of Standards. The code as published was approved as an American standard by the American Engineering Standards Committee on Feb. 20, 1928. It is known as A.E.S.C. standard No. 312—1928. The sectional committee which had charge of the revision included representatives from various national bodies interested in the standardization. The representative of the American Electric Railway Association was R. W. Eaton, public service engineer, Providence, R. I.

The code includes definitions, standards, metering, specifications for acceptance of types of electricity meters, specifications for acceptance of types of auxiliary apparatus for use with meters, installation methods, watt-hour meter test methods, laboratory and service tests, and demand meters. This edition is a completely revised and rearranged compilation of the second edition, issued in 1912, and the sectional demand meters issued in 1920.

Personal Items

A. J. Fink Given New Title in St. Louis

A. J. Fink was appointed director of transportation of the St. Louis Public Service Company, St. Louis, Mo., effective on Aug. 1. He will have full charge of all transportation matters as well as all schedule and traffic matters now in his charge. Mr. Fink went to St. Louis in March of this year, assuming the position of transportation engineer. He went there from Pittsburgh, where he learned the business of transportation under Thomas Fitzgerald.

Changes on Illinois Valley Division

E. W. Fowler has been named vice-president and general manager of the Chicago & Illinois Valley Railroad.

F. E. Fisher is retiring from the management of this property, but will continue with the organization as industrial representative.

Subject to the appoval of the Interstate Commerce Commission and of the Illinois Commerce Commission, the property of the Illinois Valley Division of the Illinois Traction, Inc., will be transferred to the Chicago & Illinois Valley Railroad. These changes were announced by L. E. Fischer, vice-president.

Honor for Key System Officer

B. W. Fernald, manager of the claim department of the Key System Transit Company, Oakland, Cal., was elected president of the Pacific Claim Agents' Association at the recent convention in Coronado. At one time Mr. Fernald was auditor of the Tonopah & Tidewater Railroad and later auditor of the Oakland Traction Company, San Francisco, Oakland & San Jose Railway, East Shore & Suburban Railway and California Railway.

New Officers Elected in Cortland

G. H. Garrison, vice-president and general manager of the Cortland County Traction Company, Cortland, N. Y., was elected president of the company on Aug. 4. Mr. Garrison's election fills the vacancy created by the death July 4 of President Edwin Duffy.

C. H. Churchill was elected vice-president and general manager; J. D. Whittemore, vice-president; Albert Haskell, Jr., secretary, and P. D. Weathers, treasurer.

Mr. Churchill has been general manager of the Port Henry Light, Heat & Power Company, Port Henry, subsidiary of the New York Power & Light Corporation. Mr. Whittemore is executive engineer of the New York Power & Light Corporation, with offices in Albany. Mr. Weathers is treasurer of the Mohawk-Hudson Power Corporation and of the New York Power & Light Corporation.

A. E. Morris Traffic Manager at Dallas

With the reputation of a big business builder A. E. Morris went to Dallas recently in the rôle of traffic manager of the Texas Electric Railway. His former position was general passenger and freight agent of the Oklahoma Railway. It was there that he arranged the details of through rates and divisions, and succeeded in increasing business from 20 to 30 per cent a year from 1923 to 1928.

Mr. Morris has climbed rapidly. In 1905 he was local agent for the Nashville, Chattanooga & St. Louis Railway at Buena Vista, Tenn. Five years later he was made local agent for the Louisville & Nashville Railway and from 1912 to 1917 he served with the Rock Island line in various capacities ranging from claim clerk to chief clerk. For the next eleven years, with the exception of two years in which he was engaged in Army service, Mr. Morris was general passenger and freight agent of the Oklahoma Railway.

A. E. Morris

He was born in 1890 in Tennessee. He has served as president of the traffic club of Oklahoma City and is a member of the Dallas Traffic Club and the American Legion. The new traffic manager predicts rapid progress for the freight business started by the Texas Electric Railway in June, a pioneer project for strictly electric companies. The company operates 231 miles of electric railway and connects with twelve other railroads passing through the heart of Texas. The service reaches many of the principal cities of the state, including nine important shopping and manufacturing centers.

Alexander Mackenzie Retires

Sir Alexander Mackenzie, Toronto, well-known in South American public utilities, has resigned as president of the Brazilian Traction, Light & Power Company, Ltd., but will remain as a director and will continue to serve in a consulting capacity. The retirement of Mr. Mackenzie, due to ill health, terminates a period of service with this company of nearly 30 years. He became president of the Brazilian company in 1915 to fill the vacancy created by the death of Dr. F. S. Pearson. At that time also he was elected president of the Rio de Janeiro Tramway, Light & Power Company, Ltd., the São Paulo Tramway, Light & Power Company and the São Paulo Electric Company, Ltd.

Changes in Akron

R. L. Stevenson, claim agent of the Northern Ohio Power & Light Company, Akron, Ohio, since October, 1924, left on June 15 to occupy a similar position with the West Penn Railways, with headquarters in Pittsburgh.

C. L. Hansen has been transferred from the auditing department of the Akron company to the claim department.

Promotions in St. Louis

Dennis Kelley, formerly assistant auditor, stores account, for the St. Louis Public Service Company, St. Louis, Mo., has been promoted to the newly created post of general storekeeper.

Herbert Mueller, who has been cost keeper for the way department, has been advanced to the post vacated by Mr. Kelley.

J. T. Hamilton With Lackawanna Consultants

James T. Hamilton, master mechanic of the New York, Westchester & Boston Railway, on Aug. 1 became consultant for Jackson & Moreland, Boston, Mass., on the electrification of the Delaware, Lackawanna & Western Railroad out of New York City. Mr. Hamilton was born in Howard, R. I., and was educated at the Cranston High School and the Bliss Electrical School of Washington, D. C. During his summer vacations while attending college he was on construction work for the Standard Electrical Company of Providence. In September, 1913, he entered the electrical department of the New York, New Haven & Hartford Railroad at the Van Nest shop, Van Nest, N. Y. He was later appointed electrical inspector and on May 1, 1917, became chief inspector. In this capacity he was assistant to the shop superintendent and through organization changes he became mechanical superintendent. Before taking up work with the New York, New Haven & Hartford Railroad, by which the New York, Westchester & Boston Railway is controlled, Mr. Hamilton had been

Digitized by Google

engaged on electrification work with the Westinghouse Electric & Manufacturing Company. For seven years he has been superintendent of equipment for the Westchester Street Railroad and the New York & Stamford Railway. He is a member of the heavy traction committee of the American Electric Railway Association and is a member of the American Institute of Electrical Engineers. Mr. Hamilton will eventually be located at Hoboken, N. J., but for the present he expects to be situated in Boston.

G. O. Muhlfeld Heads New Firm

Stone & Webster official to direct new $9,500,000 corporation which succeeds to gigantic engineering business

GEORGE O. MUHLFELD, vice-president of Stone & Webster, Inc., has been elected president of the new Stone & Webster Engineering Corporation, capitalized at $9,500,000. This corporation has taken over from Stone & Webster, Inc., its construction and engineering business and its interest in Ulen & Company, and has also acquired from the North American Company its engineering and construction company, McClellan & Junkersfeld, Inc. Besides being president of Stone & Webster Engineering Corporation and vice-president of Stone & Webster, Inc., Mr. Muhlfeld is a director of American Investors Corporation, Engineers Public Service Company, General Public Service Corporation, Grace National Bank, Pennsylvania Power & Light Company, Simms Petroleum Company, Inc., Stone & Webster Associates Corporation, Stone & Webster and Blodget, Inc., and Ulen & Company.

Mr. Muhlfeld has been associated with Stone & Webster since 1903. For the past 21 years he has been one of the principal executives of the construction and engineering branch of the business, and since 1919 the chief executive of this branch, which has done work totaling nearly $900,000,000. Born in Peru, Ind., he attended Purdue and Cornell Universities, then worked on various construction jobs in Chicago, Detroit and Seattle. At Seattle he joined the Stone & Webster organization and was associated with S. Z. Mitchell, since become a national figure in utility circles, on the Puyallup River Development, one of the earlier hydro-electric stations built by Stone & Webster.

After completing this project and others, including the Taylors Falls, Minn., development he came to the firm's Boston office in 1907. In 1912 he was placed in charge of all construction work. The scope of his activities continued to broaden and when Stone & Webster became identified with the government shipbuilding program in 1917, the construction of the Hog Island shipyards was under his personal direction as senior vice-president of the American International Shipbuilding Corporation.

Mr. Muhlfeld then changed his headquarters to the New York office of Stone & Webster. There, in addition to other work, he has had complete charge of all construction and engineering done by the organization. Included in this may be mentioned power stations for the Boston Edison Company, Southern California Edison Company, Potomac Electric Power Company, Montaup Electric Company and Luzerne County Gas & Electric Company, the gigantic headquarters for the Insurance Company of North America in Philadelphia, power stations and manufacturing plants for the Ford Motor Company in this country and abroad, and the recently-completed Conowingo hydro-electric development for the Philadelphia Electric Company. Interspersed with this work has been the supervision by him of appraisals and reports of properties valued at more than $6,000,000,000.

Ulen & Company have done a large amount of foreign work, including more recently new water-works and sanitary systems in a number of cities in Poland; water supply, electric railways, sewer systems, municipal buildings, docks and harbor improvements in the Republic of Colombia; and a reconstruction of the water-works systems of Athens and Piraeus; besides work in Brazil. Contract has recently been awarded by the Persian government to a syndicate composed of Ulen & Company and a German Consortium for the construction of a railroad across Persia, connecting the Caspian Sea with the Persian Gulf. Associated with Ulen & Company in building the southern half of the railroad are two prominent British and French firms and another American firm.

Recent work done by McClellan & Junkersfeld includes the Cahokia steam station for the Union Electric Light & Power Company, St. Louis; the San Francisco steam station for the Great Western Power Company, and the power house for the University of Pennsylvania at Philadelphia.

M. W. CHAMBERLAIN, general manager of Leeds City Tramways, Leeds, England, was appointed general manager of the Belfast City Tramways, Belfast, Ireland, on June 27. Mr. Chamberlain has been manager at Leeds for three years, and prior to that he was in Oldham. One of his first problems at Belfast will be to combat bus competition.

MILLER LASH, K.C. succeeds Sir Alexander Mackenzie as president of the Brazilian Traction, Light & Power Company, Ltd.

Obituary

WAYLAND LLOYD ARNOLD, widely known in the electric railway and public utility field, died on July 28 in Chicago.

W. L. Arnold's active life had been devoted mostly to his duties in the electric railway and other public utility fields. In 1890 he joined the Thomson-Houston Electric Company, which later was consolidated with the Edison General Electric Company to form the present General Electric Company. After being in charge of the St. Louis office of the General Electric Company he joined the Arnold Engineering Company, engineers and constructors, remaining there as vice-president until 1926. In the meantime he had also become vice-president of the Elgin & Belvidere Electric Railway, holding both offices until his retirement from active business in 1926.

Mr. Arnold was born in Jackson, Mich., on July 6, 1863. When he was one year old his parents made the journey by covered wagon from Chicago to the territory of Nebraska, settling at Ashland. There in the new west he grew up with the pioneers, his father being a member of the Territorial Legislature when Nebraska was admitted to the Union. One of his brothers is Bion J. Arnold, eminent engineer and consultant. "W. L." as he was familiarly known among his friends, was widely traveled, having visited many of the progressive countries of the world.

HENRY J. SULLIVAN, superintendent of tracks and lines of the Springfield Street Railway, Springfield, Mass., died in Springfield July 30. He became connected with the Springfield Street Railway fifteen years ago. In his earlier years he was employed by the Boston & Albany Railroad, but left that company to engage in construction work.

JOHAN M. ANDERSON, president of the Albert & J. M. Anderson Manufacturing Company, Boston, Mass., died at his home in Brookline on July 25. Mr. Anderson was born in Norway 73 years ago and came to this country 48 years ago to join his brother Albert. He was a pioneer in the manufacture of overhead line material and molded insulation, designing many of the present-day standards. Many notable achievements in the design and construction of switches and circuit breakers are attributed to him. He was well known among power plant engineers.

JOHN S. HARSHMAN, a prominent figure in the electric railway industry in Central Ohio for many years, died recently in Sprinfield. Mr. Harshman was one of the promoters of the Dayton, Springfield & Urbana Electric Railway, which later became part of the Indiana, Columbus & Eastern system. He was also an officer of the Columbus, Delaware & Marion Railway, the predecessor of the Columbus, Delaware & Marion Electric Company.

Digitized by Google

Market for Track Materials Active

Recent purchases of equipment and supplies cover wide range of products

ALTHOUGH this is not the season for large purchases of track material, reports from a number of railways, indicate that the market for track materials has been active during the past 30 days. Among the recent purchases are 60,000 cedar ties, 20,000 yellow pine ties, 4,500 tons of rails, 122,000 tie plates, 9,000 tie rods and 800 kegs of track spikes by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. The Portland Electric Power Company, Portland, Ore., has ordered $10,000 worth of rails and $10,000 worth of ties.

The Louisville Railway, Louisville, Ky., has placed an order for 25,000 ties to be used in replacement and will purchase ties, bolts, tie plates, joint plates, spikes, and bonds for the 500 tons of rail ordered in February. The Dallas Railway & Terminal Company, Dallas, Tex., has ordered 200 kegs of track spikes and contemplates the order of about one car of special work for electric over steam railway crossings. The Municipal Railway, San Francisco, Cal., has ordered eight pieces of special track work, 50 kegs of bolts and 75 kegs of spikes. The Ottawa Electric Railway, Ottawa, Canada, has ordered 250 tons of groove rail, 30 tons of tee rail and welding plates for same. Toronto Transportation Commission has ordered one Lincoln Stable Arc welder 400-600 volts d.c., 400 amp., portable truck type, and one Gurney track scale of 100 tons capacity. Another company has ordered one tongue switch, mate and half slot frog for special trackwork costing $1,369; 1,000 steel tie plates costing about $200 and one Cleveland Portable Pneumatic Grinder with 8 x 1-in. grinding wheel and wheel guard.

Georgia Power Company, Atlanta, Ga,. is negotiating with the country commissioners for the paving between the tracks from Atlanta city limits to Buckhead. Gary Railways, Gary, Ind., has started an extension of the second track on its West Eleventh Avenue line in Gary from Rutledge Street to Wilson Street, a distance of six blocks. Mount Tom Railway, Holyoke, Mass., has installed a new steel cable, 5,000 ft. long on the road running from Mountain Park to Mount Tom Summit. The company is a subsidiary of the Holyoke Street Railway.

Overhead Line Materials

Overhead line materials amounting to $30,000 were ordered by the Portland Electric Power Company and the Dallas Railway & Terminal Company placed an order for one minimum car of Creosote pine poles. The Milwaukee Electric Railway has ordered six cars of cedar poles, four cars of pine poles, two cars of weatherproof wire, one car of transformers, one-half car of signal devices and two cars of cross arms. The Toronto Transportation Commission has ordered 15,925 ft. of paper insulated, lead covered cable.

Rolling Stock

Seventeen Peter Witt type passenger cars have been ordered by the Dallas Railway & Terminal Company from the St. Louis Car Company. Ten new city cars have been ordered by the Milwaukee Electric Railway & Light Company. This company is also remodeling 40 vehicles into one-man safety cars, remodeling eight cars for suburban rapid transit service and reconstructing 34 old cars into 17 three-truck trains. It has also ordered seven new buses and is rebuilding fifteen double-deck buses into one-man operated buses. Seattle Municipal Railway, Seattle, Wash., has ordered two 21-passenger street car type Studebaker buses. Two de luxe intercity buses have been ordered from the White Company and the Bender Body Company by the Louisville Railway. The Dallas Railway & Terminal Company has ordered 150 rolled steel wheels and the Toronto Transportation Commission ordered 100 wheels.

A new 35-bus garage and equipment for same is contemplated by the Municipal Railway of San Francisco. The Portland Electric Power Company has let a contract for power and substation work amounting to $25,000 and the Milwaukee Electric Railway & Light Company has let contracts for a $1,200,000 addition to its Lakeside Power plant. The United Railways & Electric Company, Baltimore, Md., plans a substation to cost approximately $150,000.

Track Extension in Memphis

Memphis Street Railway, Memphis, Tenn., has notified Mayor Overton that as soon as the city passes an ordinance permitting the extension the railway will begin construction of car tracks on Jackson Avenue from the present end at Watkins to the L. & N. crossing.

The line, approximately 1¼ miles long, will cost more than $70,000.

Improvements in Ontario

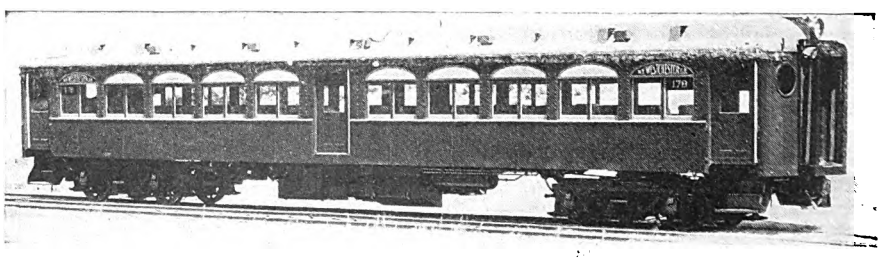
Hydro Electric Railways, Toronto, Canada, has underway a large program of track construction and rehabilitation in Windsor and surrounding municipalities. The work in Windsor includes 1,000 ft. of track and a Y being rehabilitated. This track is in pavement, and International twin steel ties and 100-lb. T-rail, A.R.A. type A section, are being used. A contract has been given Cadwell Sand and Gravel Company for the sub-grade, and work has

New York, Westchester & Boston Railway Cars Being Delivered

Delivery of twenty cars is being made to the New York, Westchester & Boston Railroad, New York, N. Y., by the Osgood Bradley Car Company, Worcester, Mass. These cars, which were described in the April 21 issue of the JOURNAL, are designed for heavy suburban service and are 72 ft. 7¼ in. long and 9 ft. 10¾ in. wide. The car bodies weigh about 63,200 lb., each car weighing approximately 124,830 lb. complete. They are of the all-steel type, made up of unit side frame, Stillwell design.

The trucks have an 8-ft. wheelbase, the motor trucks being equipped with 36-in. wheels and two inside-hung motors. The trailer trucks are equipped with 42-in. wheels. The 11,000-volt single-phase power feeds through one of two pantographs through high tension leads to the transformer. The voltage is then stepped down for use on motors and auxiliary circuits.

The interior of these new cars is finished in green with white enamel ceiling



Type of heavy suburban cars being delivered to the New York, Westchester & Boston Railroad

Digitized by Google

started. The cost of the work will be approximately $31,000. On London St., between Windsor city limits and Huron Line in Sandwich, 3,000 ft. of double track will be rehabilitated. This track is in concrete. Steel ties and T-rail, A.R.A. type A section, will be used, and joints will be welded by the Thermit process. Work will start in the near future. The cost of the rehabilitation will be about $80,000. On Field Ave., in Windsor and Sandwich, and on Lena St. in Sandwich new track is to be laid. On Field Avenue in Windsor 2,500 ft. of double track will be laid in pavement, and on Field Avenue and Lena St. in Sandwich 3,000 ft. of single track, open construction, will be laid. On the double track steel ties and 100-lb. T-rail, A.R.A. type A section, with Thermit welded joints, will be used; on the single track, 100-lb. rail, cedar ties with tie plates, and stone ballast, will be used. The job will cost approximately $130,000. On Tecumseh Road, Ford City, easterly to Ford City limits, 3,000 ft. of single track, open construction, will be laid. C.P.R. section 85-lb. rails, tie plated cedar ties, and stone ballast will be used. The work will cost about $31,000. All of the foregoing work is to be completed during the present construction season.

Eighteen New Cars for Phoenix

Phoenix Municipal Railway, Phoenix, Ariz., will purchase eighteen double-end, double-truck cars according to plans adopted by the City Commission. Bids on the cars will be opened on Aug. 22. New cars were called for in the rehabilitation ordinance for which the $750,000 bond issue was approved by the voters on April 30, 1927. The legality of the bond issue was upheld by the State Supreme Court on Jan. 16.

Philadelphia Loop Construction to Start in Fall

With $4,000,000 available, Philadelphia, Pa., is preparing to proceed with the construction of the Ridge Avenue subway loop, an authorized project in step No. 1 of the high-speed program.

Director Myers, of the Department of City Transit, has ordered the plans expedited so that actual construction will get under way by fall.

The subway extension will proceed east from Broad Street and Ridge Avenue and south on Eighth Street. The city is proceeding with condemnation of the land involved in the cutting through of Ridge Avenue from Ninth and Vine Streets to Eighth and Race Streets.

Information on Shipping to A.E.R.A. Convention

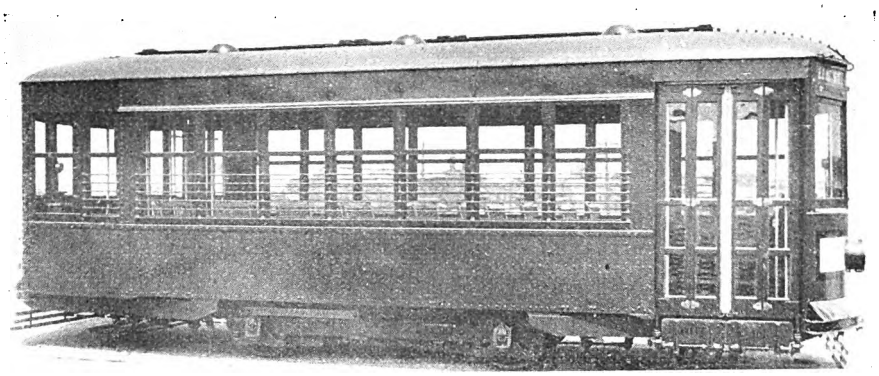
Shipping information which has been mailed to all exhibitors at the coming A.E.R.A. Convention in Cleveland, by Frederick Dell, director of exhibits includes instructions in shipping both by freight and express. All freight and express shipments should be prepaid. All carload shipments made over any railroad should be consigned as follows: Your firm name, care of Norris Bros. Company, Pennsylvania Railroad, City Hall Siding, Cleveland, Ohio, space number, for American Electric Railway Association Convention. Less than carload shipments, or L.C.L. freight should be shipped over any railroad addressed as follows: Your firm name, care of Norris Bros. Company, 2138-44 Davenport Avenue, Cleveland, Ohio, space number, for American Electric Railway Association Convention. Original bills of lading should be mailed direct to Norris Bros. Company, 2138-44 Davenport Avenue, Cleveland, Ohio.

Exhibitors in the Central Electric Railway territory may ship over any of the lines in that territory. The three interurban lines going into the City of Cleveland are as follows: Cleveland

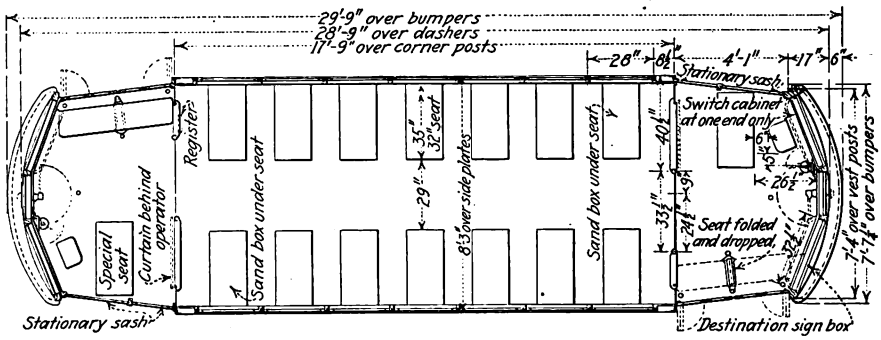
Single-Truck Cars for Mobile

Six one-man, motor, city type passenger cars are being built for the Mobile Light & Railroad Company, Mobile, Ala., by the American Car Company, St. Louis, Mo. The cars are of the double-end, single-truck type with fourteen seats. Each car is 29 ft. 9 in. long, 8 ft. 3 in. wide and 10 ft. 8 11/16 in. high from rail to trolley base.

The bodies are semi-steel construction with arch roofs and folding end doors. The finish is in yellow enamel with Mexican mahogany interior trim. Each truck is equipped with two outside-hung motors and 26-in. wheels. The truck wheelbase is 8 ft. 6 in. Plain journal and armature bearings are used. Additional details are given below.



One of the single-truck, one-man cars being built for the Moblie Light & Railroad Company, Mobile, Ala.



Floor plan of the Mobile cars

Length over all	29 ft. 9 in.
Length over body posts	17 ft. 9 in.
Truck wheelbase	8 ft. 6 in.
Width over all	8 ft. 3 in.
Height, rail to trolley base	10 ft. 8 11/16 in.
Window post spacing	28 in.
Body	Semi-steel
Roof	Arch
Doors	Folding-end
Air brakes	G. E. straight
Armature bearings	Plain
Axles	A. E. R. A.
Car signal system	Faraday buzzer type
Compressors	D. H. 16
Conduit	Flexible duraduct
Control	K-63 B R
Couplers	Pull bar
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter roller type
Door mechanism	National Pneumatic Company
Fare boxes	Johnson D M 4
Finish	Enamel
Gears and pinions	Spur tooth
Glass	Plate
Hand brakes	American Car Company's drop handle
Headlights	Ohio Brass Company's Imperial W-D-F
Interior trim	Mexican mahogany
Journal bearings	Plain
Journal boxes	Brill
Lamp fixtures	G.E.
Motors, 2	Westinghouse No. 510-E, outside hung
Painting scheme	Yellow
Registers	International R 5
Roof material	Canvas
Sash fixtures	O. M. Edwards Company
Seats	Waylo reversible
Seat spacing	28 in.
Seating material	Wood slats
Slack adjusters	Brill
Steps	Folding
Step treads	Feralun
Trolley catchers	Earll with No. 79 socket
Trolley base	U. S.—20-A
Trolley wheels	U. S. No. 31
Trucks	Brill 79-E-2
Ventilators	Brill exhaust
Wheels, type A.E.R.A.	Diameter 26 in.
Wheelguards or fenders	American Car Company

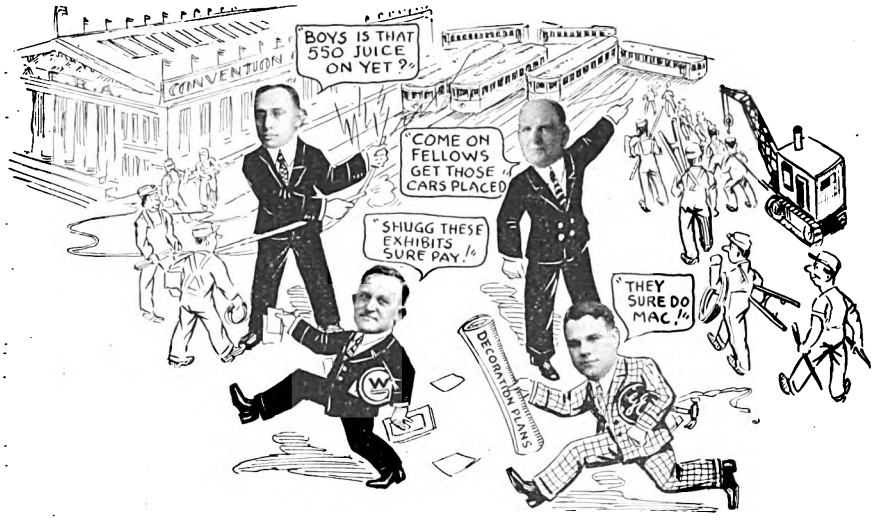
Exhibitograph No. 16



Carrying out the plans

and South Western Railroad-Boliver Road Station, Northern Ohio Power & Light Company-Boliver Road Station, and the Lake Shore Electric Railway-Boliver Road Station.

All street cars intended for track display and shipped to Cleveland on their own wheels or on flat cars should be shipped and billed as follows: Your firm name, care of Cleveland Railway Company, Harvard Avenue Yards, Newburgh and South Shore Railroad Delivery, Cleveland, Ohio, space number, for American Electric Railway Association Convention. All such cars will be handled by the Cleveland Railway Company, moved to the city over their tracks and placed in exhibition space at actual cost of unloading, reloading, transporting, and placing. No charge will be made for storage.

All electric locomotives, gasoline rail cars, dump and crane cars, shipped to Cleveland on their own wheels should be shipped and billed as follows: Your firm name, care of Norris Bros. Company, Pennsylvania Railroad, City Hall spur track, Cleveland Public Auditorium, Cleveland, Ohio, space number, for American Electric Railway Association Convention. Norris Bros. Company will handle such rolling equipment. Buses arriving in Cleveland under their own power can be delivered by owners' drivers direct to exhibition space and placed. A charge for unloading buses will be made when necessary.

Exhibitors making shipment by express and desiring an express company to make delivery direct to the auditorium should consign their exhibits as follows: Your firm name, for American Electric Railway Association Convention, space number, Cleveland Public Auditorium, Cleveland, Ohio, express prepaid. Many other important instructions are included in the shipping information, and copies may be had by addressing the director of exhibits of the American Electric Railway Association, 292 Madison Avenue, New York, N. Y.

Timken Axle Earnings Show Gain

Operations of the Timken-Detroit Axle Company for the six months of 1928 show earnings of $716,410 after all charges, including estimated federal tax, as compared with earnings of $660,011 for the first six months of 1927.

The company's financial condition has continued to improve. Cash and certificates of deposit amount to $3,843,568, showing an increase of $219,461 since the first of the year, with no debts other than for current liabilities. Net working capital is $8,907,002, an increase of $1,019,919 during the six months. The surplus account now stands at $3,584,754 and the book value of the common stock is $14 per share. Common and preferred dividends have been paid amounting to $455,209, and $99,057 has been paid for the purchase of preferred stock for sinking fund purposes.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

Metals—New York	Aug. 7 1928
Copper electrolytic, cents per lb.	14.525
Copper wire, cents per lb.	16.625
Lead, cents per lb.	6.20
Zinc, cents per lb.	6.60
Tin, Straits, cents per lb.	47.875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.15
Somerset mine run, f.o.b. mines, net tons	1.825
Pittsburgh mine run, Pittsburgh, net tons	1.75
Franklin, Ill., screenings, Chicago, net tons	1.50
Central, Ill., screenings, Chicago, net tons	1.475
Kansas screenings, Kansas City, net tons	2.175
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.3
Weatherproof wire base, N.Y., cents per lb.	17.125
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.1
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal	$0.58

TRADE NOTES

REYNOLDS ELECTRIC COMPANY, Chicago, Ill., has taken over the Korrectolite Company and E. F. Oliver, formerly general manager of the Korrectolite Company, is now with the Reynolds Electric Company.

SULLIVAN MACHINERY COMPANY, Chicago, Ill., has appointed as its distributors in New York, N. Y., the United Hoisting Company; in Salt Lake City, Utah, the Utah Eastern Iron & Metal Company, and in Sacramento, Cal., the Standard Equipment & Supply Company.

GUNITE CORPORATION, Rockford, Ill., has announced the recent appointment of C. W. Rhoades to the sales division of that company. In his new capacity Mr. Rhoades will act as sales engineer in direct contact with the bus field in furthering the use of Gunite brake drums. Mr. Rhoades' experience in the organizations of the Fageol Motors Company of Kent, Ohio, and the Cincinnati Car Company, together with his previous long experience in the railway field, gives him an unusually good background for serving in his new capacity.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., announces that Fred Johnson, heretofore in charge of its St. Louis sales office, is now manager of the Los Angeles branch office. This transfer brings to a close 21 years of service as district manager of the St. Louis territory. Alexander L. Miltenberger, heretofore Pacific Coast manager with headquarters in San Francisco, has been transferred to St. Louis as branch manager of the St. Louis office.

L. B. FOSTER COMPANY, Pittsburgh, Pa., has opened a St. Louis office, located at 1725 Railway Exchange Building, where it will render service to buyers and users of industrial trackage.

ADVERTISING LITERATURE

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has just released a new publication (Reprint 334) under the subject "Oil-Electric Motive Power on the Canadian National."

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, has issued a bulletin describing the new electronic tornado method of welding entitled, "Automatic Arc Welding by the Electronic Tornado Process." The text deals first with the strength, ductility and metal structure of the welds made by the new process. It continues with a description of the operation and a table showing the speed and costs of automatic arc welding of metal of different thicknesses for various joints.

Mr. Hoover Expresses His Views on Business

FOR the first time in American history since Washington, an engineer is a candidate for the highest office in the land. The engineering profession and American business men have therefore had reason to expect in this Presidential campaign an unusually practical and comprehensive interpretation of the relation between economic and social problems. Though business men have for several years known something of the views of Herbert Hoover on the relation between government and business, and have experienced the results of the application of those views in the functioning of the Department of Commerce under his guidance, there is, nevertheless, a new significance in their expression to the nation as the policy of a candidate for the Presidency at the opening of a great political campaign.

In his speech on Aug. 11, accepting the nomination as the Republican candidate, Mr. Hoover lost no time in justifying the confidence of those who looked to him for a straightforward expression of sound governmental policy regarding business. In a few short paragraphs he lays down a business creed, not alone for the nation and the government, but for business itself. He recognizes first that increasing complexity of our economic life tends to multiply the relations between government and business. It is the government's function to maintain equality of opportunity and to protect public rights. Beyond that it should not go. It should not extinguish enterprise and initiative by going into competition with its own citizens. "The production and distribution of goods on a large scale is not wrong," said Mr. Hoover. "The test of business is not its size—the test is whether there is honest competition, whether there is freedom from domination, whether there is integrity and usefulness of purpose."

Upon business itself Mr. Hoover places the responsibility for regulating its own conduct so as to make unnecessary government regulation or competition. Business is founded upon public faith and a high sense of moral responsibility within business itself, he maintained. In the fact that self-regulation of business has grown rapidly he found great promise for the future. He refrained from elaborating on the part which the Department of Commerce, under his guidance, has played in helping business and government to work co-operatively in bringing about higher standards of business practice. But business men themselves know from their experience with the Department of Commerce, Mr. Hoover's capacity to put into practice the ideals and principles which he expressed in his speech.

American business, non-partisan in the past, should be most reluctant to abandon this policy, the wisdom of which has been proved by experience. The powers of the nation's chief executive are so circumscribed that business has little to expect from the election of any particular candidate. In Mr. Hoover and Mr. Smith, the country is fortunate in having a choice between two strong and able men. But under our system of government we elect a president through a great national political campaign in which views on questions affecting the country's economic welfare are given the widest possible circulation. Unfortunately, sound principles are sometimes submerged in the heat of partisanship. When, therefore, for the first time, we find an engineer engaged in a campaign for the presidency it is not surprising that something of the unusual has entered the proceedings. It was to be expected that the passion for accuracy and straight thinking which are cultivated in the mind of the engineer from early training, when seasoned by world wide experience in many lands and under many economic and social systems, would reflect itself under the glaring spotlight to which a presidential aspirant is subjected. This evidence we find at the very beginning of Mr. Hoover's campaign in the blunt statement, "We shall use words to convey our meaning, not to hide it." Surely, American business will indorse this unique procedure in a political campaign. It is to be hoped that Mr. Smith will follow the same policy, and that his views on economics and business will be equally sound and as frankly expressed.

Much for the Maintenance Man at the Convention

PERHAPS no other group will find so much of interest and value in the exhibits and proceedings at the forthcoming Cleveland convention as those men who have to do with maintenance of cars, buses, track and overhead. This is the group to whom the problem of keeping the wheels turning is not a matter of casual interest but of constant concern. The men responsible for maintenance activity are everlastingly on the firing line, and are quick to respond to any suggestions for improving their practices or methods. Ideas which a shop foreman, a roadmaster or a master mechanic might pick up from the exhibit itself, or from contact with others engaged in the same line of work, often can be translated into tangible results with little delay and with little or no expense.

It is particularly desirable that the minor executive attend. None is quicker to grasp the value of a new shop kink or mechanical device than the man directly in charge of any one of the numerous jobs that are included in the daily routine of the average maintenance force. After all has been said and done, it is often the foreman or minor executive who carries the real burden of keeping things going, and in no phase of operation is this more true than in the maintenance department.

At Cleveland there will be displayed not only the regular line of tools and machinery that have featured

This is the issue in August that is devoted essentially to maintenance and construction subjects

Digitized by Google

the exhibits in years past, but a number of appliances more recently developed and not previously shown. The car and truck exhibit is to be particularly interesting, illustrating the latest advances in improving the street car to meet the present-day standard of transportation. The bus display, as heretofore, will include the latest refinements in body and chassis design. Manufacturers of garage and shop equipment have promised a noteworthy display of their products.

The property of the Cleveland Railway in itself constitutes an exhibit of no mean order. Here are to be seen modern shops, cars of the latest design, excellent track and roadway, and an up-to-the-minute operating organization. The city is the center of an extensive network of interurban lines and bus routes. Also in Cleveland and its immediate environs are the plants of a number of the leading manufacturers of electric railway materials and of buses and bus bodies.

As to the proceedings at the convention meetings, it is enough to say that a diversified program of interest to maintenance men has been arranged under the auspices of the Engineering Association of the A.E.R.A., with discussions led and participated in by prominent figures in the industry. A foreign observer has said that one of the most potent sources of American supremacy in industrial achievement is the free exchange of ideas among industrial leaders. Of great value to those operating and maintenance men fortunate enough to attend the Cleveland convention will be the opportunity afforded to meet and exchange ideas with men engaged in similar work from all parts of the land. The meeting is not sectional; it is national in scope. The operator from the Pacific Coast is given an opportunity to make contact with men busy with similar activities and confronted with the same problems from the Gulf states and the Atlantic seaboard. In the hotel lobbies, among the exhibits, at the regular sessions and at committee meetings acquaintances are made and ideas assimilated of lasting value to the individual and to the company he represents. A single improvement suggested by a casual conversation or the discussion in one of the regular sessions may lead to a saving worth many times the cost of the trip. In no industry is there a freer exchange of thoughts than among members of the electric railway fraternity, and the annual convention is a recognized clearing house for these ideas.

Preventive Maintenance Methods Applied to Rail Corrugation

IN LINE with the modern medical theory that it is better to prevent disease than merely to cure it, W. W. Wysor, chief engineer of the United Railways & Electric Company of Baltimore, has developed a system of removing rail corrugation before it has become serious. Details of the method used to accomplish this are given in an article appearing elsewhere in this issue. The essence of his plan is rapidity in grinding. This is effected by using a car equipped with two reciprocating grinders, one for each rail. A twofold grinding effect is produced—that resulting from the reciprocating apparatus itself and that from the movement of the car along the track.

Prior to the adoption of this method of removing corrugation the company's maintenance-of-way force was able to do no more than keep pace with the development of corrugation. While the crews were busy grinding in some places, corrugations were multiplying in other places. At the end of the year the total amount of corrugation on the system was about the same as at the beginning. Now, however, by means of the grinding, corrugations are removed much more rapidly than they are being formed. Minor corrugations are ground down before they have a chance to become serious. The grinding of new rail immediately after its installation, to forstall the development of incipient corrugation, is under consideration. It is hoped ultimately to be able to keep the entire system practically free from rail corrugation.

Factors That Affect Motor Life

MAINTENANCE of motors after they are installed under cars consists chiefly of brush replacements, brush-holder inspection, tension adjustments, gaging distance between armature and pole faces to check bearing wear and the addition of oil to the bearings. Of these, brush replacements and oiling ordinarily determine the period between inspections.

Repairs become necessary due to grounding or short circuiting of armatures or fields, excessive wear of bearings and gearing, looseness or breakage of armature bands and need for reslotting commutators. It is at the time such repairs are made or when the motors are given a general overhauling that things may be done which affect the ultimate life of the motor.

The insulation may have become dried out and baked, due to overloading, but whether or not the armature is rewound completely usually will depend on the judgment of the armature room foreman. By far the easiest procedure is to clean the armature and place a coat of insulating varnish on the exposed parts of the winding, fix up the string band, reslot the commutator and return the armature to service. If the foreman could look ahead and see the armature coming back into the shop in a few weeks due to grounded coils, he would rewind it and a service failure would be avoided.

How can exact knowledge replace guesswork in motor maintenance? In the particular instance just given severe routine shop tests afford the probable remedy. Giving the armature the overloads in current and voltage that it will have in service is not sufficient. The tests should be so severe and exhaustive that if the armature gets by, it will be sure to stay out until the next scheduled overhauling.

The useful life of a railway motor generally is determined by the frequency with which troubles occur. To eliminate the troubles, repairs must be made with the best material that it is possible to obtain and the work must be well done. It is by doing things that may seem to be not absolutely necessary, that the ultimate life is extended. Thus it is considered advisable to reband a newly-wound armature after about one year's service, as bands stretch and the insulation shrinks due to the high temperature to which it is subjected. Manufacturers recommend that armatures be dipped in insulating varnish and baked about every second year. Excessively worn bearings cause much motor trouble. Vibration and pounding cause rapid deterioration, and improper meshing of gears may cause overloads. Limits of wear should be small and bearings should be checked frequently.

There are many outside factors that influence the life of an armature. Dirt and moisture cause rapid electrical deterioration. They must be kept out. Rough track not only causes excessive vibration but overloads and severe electrical stresses due to carbons being jarred off the commutator.

Digitized by Google

The price of freedom from service failures is eternal vigilance. The best of materials are by far the cheapest in the long run. A carefully trained organization must be created to do the work, and a definite and systematic program of overhaul must be rigidly maintained. Then the pull-in record will quickly tell the rest of the story.

Real News Still in Demand

PUBLIC utility news, if it is genuine news, frank, honest and constructive in character, is wanted today by the newspapers just as much as it ever was. There may have been some feeling in the electric railway industry that public utility news had lost its standing as a result of the recent Federal Trade Commission inquiry in Washington, and that it would be useless to make it available to the press. This is not true. The demand that has always existed still exists among high-class publications and news services. The instructions recently sent out by the Associated Press to its correspondents, as printed in the *Editor and Publisher,* reveal this clearly. These instructions say in part: "It is the business of the Associated Press to carry news. We will continue to receive press agents or anyone who has news to offer until such time as they are shown to be unworthy. . . . Letters from some correspondents indicate a feeling of resentment against publicity men and a disposition to shun them. . . . We expect our correspondents to be ready to pit their news judgment against anything that may be offered by any press agent, regardless of its disguise. If there is news in what is offered, the correspondent should not be afraid to handle it just as he would news from any other source."

The position taken by the Associated Press is in complete harmony with that of progressive railway managements. When something occurs to make real news, the alert newspapers will be glad to hear of it. No intelligent publicity man can expect to secure space in the news columns for any other kind of material. When he has real news to offer he will find himself just as welcome in the newspaper editor's office in the future as he has been in the past. When he has no real news to offer, the best thing he can do is to keep away from the newspaper office.

Southern Properties Better Their Pull-In Records

PROMINENT among the activities of the Electric Railway Association of Equipment Men, Southern Properties, is the keeping of records of pull-ins and maintenance of equipment costs of the various properties. These are prepared in chart form and distributed to the delegates in attendance at the annual meetings. At the meeting held in Cincinnati July 25-27, 1928, analysis of the reports submitted showed a pronounced improvement for each of the seven years since the organization of the association. For the first time since the institution of the graphical analysis of pull-ins the New Orleans Public Service, Inc., yields first place to another property, the Nashville Railway & Light Company. Their respective records of 111,699 miles and 112,987 miles per pull-in not only are remarkably close, but are some 46,000 miles per pull-in ahead of the next highest property.

Almost without exception the companies in the association show an improvement in their average miles per pull-in this year over last, while in only two instances has the comparative maintenance cost per car-mile increased over the 1927 figure. While equipment, maintenance methods and organization are partly responsible there is no question but that the real secret of decreased pull-ins lies in the closer co-operation which most of the properties concerned are obtaining between their mechanical and transportation departments. To the pride of workmanship of the former must be coupled a considerate handling of equipment by the latter. There must be that type of co-operation that scorns formality where the situation justifies it, that sees eye to eye and works shoulder to shoulder for the accomplishment of the greater good.

In no small measure the excellence of programs and the close attention to business which have characterized the meetings of the equipment men's association since its inception in 1921 have been reflected in service betterment on the Southern properties. The work of better informed, more forward-thinking maintenance men is bound to play an important part in making records such as have been cited here.

Record Machine Tool Performance

FOR determining the efficiency of the various machines used on different classes of work and to make proper recommendations to the management for the purchase of machine tools, the shop superintendent in every electric railway should have available at all times a complete history and performance record of every machine and tool in the shop. Too often the only record kept is in the head of the shop foreman, leaving the choice of new equipment to be determined by his unsupported opinion or by the manufacturer's representative having the best sales talk. Such slipshod methods are often one of the causes of high maintenance costs, resulting in the discouragement of proper maintenance programs.

A large industrial plant has worked out a system of records from which data can be secured on any of its machine tools employed to handle job work. Every machine is numbered and indexed so that a check upon it can be made at any time. Every five years the whole record is gone over and a study made of the tools taken out of service during that period. The records show why each machine is removed or changed from one service to another, how much is spent on each of them, how long they have been in use, the type of operator employed, whether they are on night or day work and whether they were employed in heavy or fine work.

Time studies are included with the records which show what make or type of machine does a particular job most efficiently and what men are best suited for each machine. Particular attention is paid to the life of each machine. From these records it is possible to determine whether a machine is obsolete for a particular type of work, and whether it should be scrapped or transferred to another shop where the service required is lighter. The records also show the weaknesses of various designs and construction of machines and the frequency and cost of repairs on each.

Not only will such records assist in purchasing new machines of the most suitable design but they will assist greatly in the efficiency of the machine shop. Such a system can be worked out as well for an electric railway as for a contract shop. By this means it is possible to eliminate the guess work. Cold facts on machine operation would pave the way to lower maintenance costs.

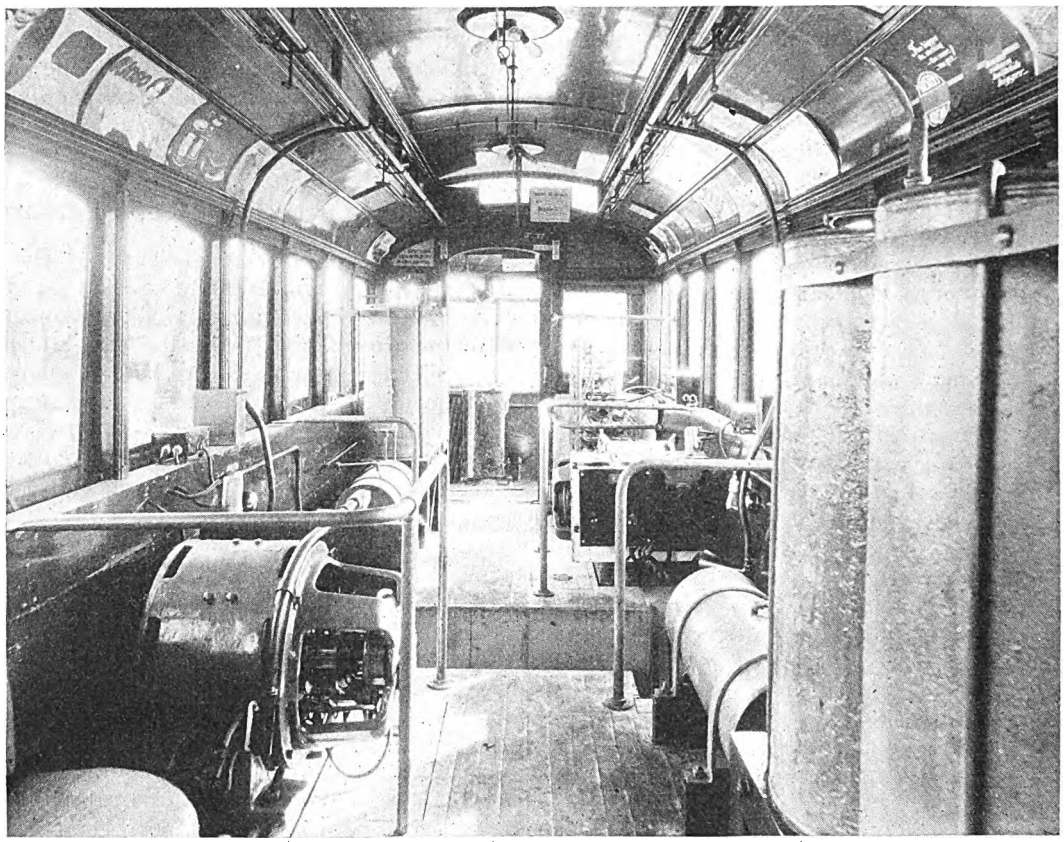
Keeping Ahead of Corrugation

Use of a special car, equipped with reciprocating grinders, enabled the United Railways & Electric Company of Baltimore to grind as much rail during the first six months of 1928 as was covered formerly in a year's time

By W. W. Wysor
Chief Engineer United Railways & Electric Company, Baltimore, Md.



Interior of car showing motors for operating the grinders, storage tanks for water, and at the far end of the car the resistance grids for operating the car at low speed
The speaking tube for communicating with the motorman may also be seen against the side of car where the grinder sits and in the motorman's vestibule directly over the controller.

RAIL corrugation is a problem that has harassed the electric railway industry for many years. It has been studied by many committees of scientific bodies and various theories have been advanced to account for it. While the scientists have been busy endeavoring to locate the cause of this trouble the way engineer has been faced with the task of removing the corrugations already in existence.

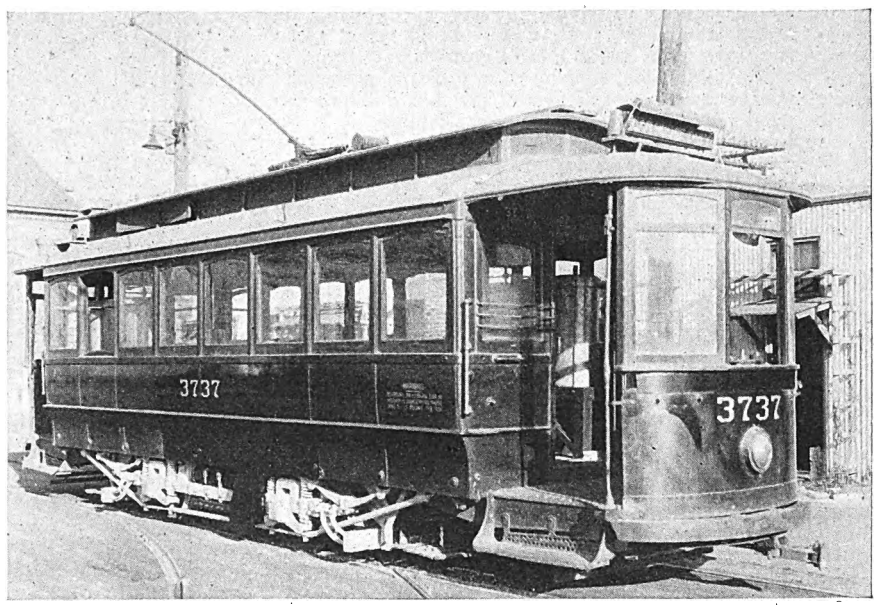
It has been the practice of the United Railways & Electric Company of Baltimore to remove corrugations by means of reciprocating grinders. The rotary type, however, has been used sometimes on very heavy corrugation for doing the rough work, being followed by the reciprocating grinder for the finishing. It is felt that better work can be done with the reciprocating type of grinder since the grinding brick moves in a plane parallel with the rail surface and there is no tendency to grind cups in the rail as is sometimes the case with the rotary grinders.

On this property we have about 250 miles of paved track on which most of our corrugation occurs. All of the corrugation that is really serious occurs in paved track. For a number of years we have ground out an average of 100,000 ft. of corrugation per year but we have never been able to catch up with the work. In other words, at the end of each year there appears to be as much corrugation as there was at the beginning. The reason is that we have been grinding only the heaviest corrugation because that is the most important, and by the time we got around to grinding the lighter corrugations, they had become heavy. With this situation facing us we began to seek some way of removing corrugation

Digitized by Google

more rapidly and, if possible, with less expense. With this end in view we considered the construction of grinding equipment which might be attached to a car and operated over tracks along with other equipment.

At that time several grinding cars had been constructed and were in operation on various electric railways. Most of these we examined before undertaking the construction of a car for this property. On these cars the grinding bricks were stationary and the cutting action was obtained by dragging the car along the track. We were convinced that this was not the proper method because it did not give sufficient grinding action, and moreover, did not permit intensive grinding at spots where heavy corrugation occurred. At this stage in our deliberations we conferred with the Railway Track-Work Company of Philadelphia. This concern undertook the design of special reciprocating grinders which could be installed on one of our obsolete single-truck passenger cars. The equipment which they designed and which has been installed in a car has proved to be very efficient and satisfactory in the removal of corrugation.



General view of the exterior of the grinding car

Grinders Operated at High Speed

This equipment, which was described in Electric Railway Journal for June 23, 1928, consists of two independent reciprocating units installed one on each side of a single-truck passenger car having a wheelbase of 7 ft. 6 in. Such alterations were made to the car floor as were necessary to accommodate the grinding equipment. Each grinding unit consists of a frame carrying four grinding bricks and machinery similar to the reciprocating grinders which have been manufactured for many years by this company. The power for driving the bricks is delivered by a 10-hp. motor, through a silent chain drive. The speed at which the bricks reciprocate is 600 strokes per minute or about double the speed of the ordinary reciprocating grinder.

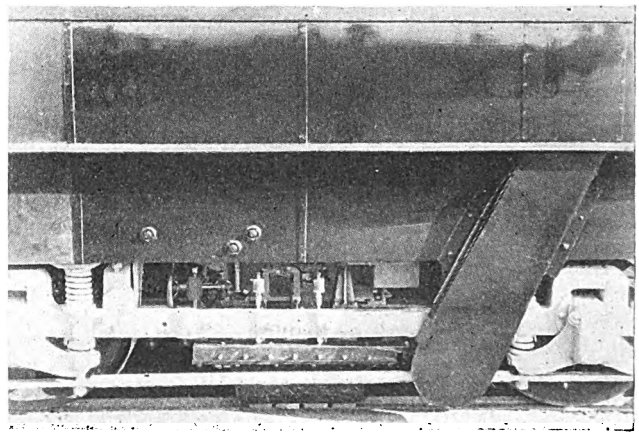
The car is equipped with tanks which supply water for grinding and with banks of resistance which make it possible to operate the car at any desired speed from a mere crawl up to the normal speed of passenger cars. Convenient seats are provided for the operators whose duty it is to raise and lower the bricks as may be necessary. This is done by a hand wheel. There is also a hand wheel for tightening the blocks in the holder after they have been raised or lowered. Nearby is a valve controlling the water supply. The car is equipped with lights for night grinding. A speaking tube for communicating with the motorman is provided and an electric bell which indicates when the maximum working pressure of the bricks on the rails has been reached. This car may be operated at full speed in between passenger cars which gives a double grinding action; that is, grinding action results from the car dragging the bricks over the rail in addition to the reciprocating motion. The car may stand still and grind or move at any desired speed.

Where there is light corrugation over a considerable stretch of track the car can be worked to advantage during the day, especially if the headway between passenger cars is not too great. The grinding car is shunted back and forth between permanent cross-overs or other forms of special work which will permit it to shift from one track to the other. Where heavy spots of corrugation occur the grinding car is brought to a standstill, or nearly so, and it then proceeds to grind until it is necessary to move out of the way of approaching passenger cars. Then the grinding car with the grinding machinery still in operation moves along to the nearest cross-over, crosses and proceeds to some heavily corrugated spot on the other track where it is again slowed down until necessary to move out of the way of traffic. By this means the light corrugation is all ground out during shifting operations and the heavy corrugation in between regular car movements. However, as a matter of course, the most efficient work can be done when there is the least traffic and consequently we do most of our grinding at night.

Better Work Can Be Done at Lower Cost

Some of the advantages of this type of grinder are as follows:

1. It is a standard piece of rolling stock, self-propelled and capable of making the same speed as passenger cars. It can, therefore, be stored readily at any convenient carhouse or yard and be moved to the job without difficulty or outside help of any kind.
2. It is not necessary to interrupt traffic as the grinder can move out of the way of approaching cars.

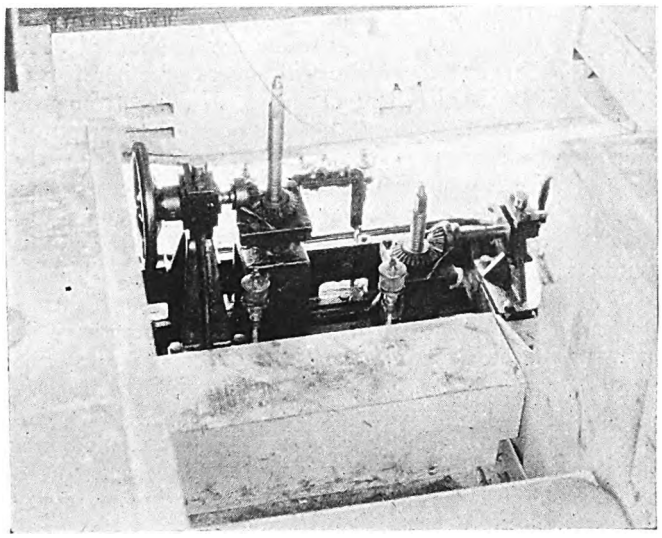


Close-up of the grinding brick and the operating mechanism. The housing covering the chain drive may be seen on bottom

Digitized by Google

3. It is not necessary to remove the grinder from the track as is the case with other equipment when working under traffic, and consequently there is no obstruction to free wheel traffic.
4. The men using this equipment are better protected than those using other types of equipment as they are inside the car and are safe from being struck by passing automobiles, or by passenger cars as sometimes happens with small equipment.
5. Work can be carried on during cold or rainy weather, as the men are protected from the weather because they are inside the car. In fact, we find it advantageous to do grinding in rainy weather, as little cooling water is required.
6. Better work can be done because the truck with its wheels resting on the rail forms a perfect guide.
7. Work can be done much more rapidly with this grinder than with any other type with which we are familiar.
8. The cost is less.

For a number of years the equipment for grinding corrugation and joints on this property has consisted of four reciprocating grinders. It has been our custom to keep three of these in service, the fourth one being held as a spare. As it requires a crew of three men to handle each grinder our total corrugation grinder force consisted of nine men. The new grinding car requires a crew consisting of one motorman, one conductor and two grinders.



Inside the car, showing the operating mechanism for raising and lowering the bricks and for tightening them in the holder. The floor has been cut away to accommodate the grinders

This car was put in service Dec. 5, 1927, and has been in almost constant use ever since. During the first six months of 1928 we have ground as much rail with this car as we usually grind in a year's time with the ordinary reciprocating grinders. The average cost per foot of rail for work with this car is about one-third of the cost of grinding with the ordinary reciprocating grinders. The car has actually paid for itself the first six months it has been in service, and we expect not only permanently to reduce the unit cost of grinding, but also, to catch up with the work. Instead of grinding heavy corrugation all the time as has been necessary heretofore, we expect to catch it in its incipiency and prevent its ever becoming heavy.

Grinding New Rail Proposed

Sometimes in running this car over tracks where light corrugation appeared only in spots we discovered that the track was corrugated for its entire length. The first passage of the car brightened up the high spots so as to make the corrugation show up which was otherwise invisible. This has brought us to the conclusion that perhaps it would be a wise thing in laying new track not only to grind the joints, as has been our practice heretofore, but to run this car over the entire stretch so as to take out any mill corrugations or other irregularities that might exist in the rail surface and thus remove physical imperfections that may be the beginning of corrugation.

German State Railways Build Large Shops

In preparation for the electrical operation of the Stadtbahn large overhaul electric railway shops have been erected near Berlin

EQUIPPING of the Berlin Stadt- und Vorortbahnen with the 800-volt direct-current system is being pushed rapidly by the German State Railroads, the owner of the property. Particulars of the rolling stock and electrical distribution system of this railway were published in the issues of this paper for Nov. 3 and Nov. 27, 1927. In connection with this electrification, extensive shops are being built at Nieder-Schöneweide, in the neighborhood of Berlin. These shops were begun in August, 1926, and were so far along in the autumn of 1927 that some of the work of the electrical equipment of the cars was carried on in them at that time. The accompanying airplane photograph was taken in July, 1927. Being the latest large electric railway shops in Germany, the layout should prove of interest.

As will be seen from the plan, the car-body shop has three bays which together have accommodation for 66 car bodies, each bay being served by a traveling crane. There is space to the left for the later erection of another bay with accommodations for 24 more bodies.

On the opposite side of the body shops, extending the full length of the building, is the department for miscellaneous electrical equipment, then in turn, departments for motors, brake parts, and wheels and trucks. Beyond these sections is space for expansion and beyond this, in the open, are short storage tracks for trucks, axles and wheels. This open section is served by a transfer table.

The paint shop is in a building by itself on the eastern side of the main building. The offices are four and five stories in height, and are shown in the center of the airplane photograph. The storage buildings are at the opposite, or northern end.

As will be seen from the plan, cars for overhaul enter on one of the tracks on the left-hand or farther side of the shop and first pass through the wash room. They then proceed until they reach the body shop, where the bodies are lifted off the trucks by cranes and are set in any position desired in the shop. The trucks continue on the original track, but a little further along the motors and brake equipment are removed. The trucks are then taken to the cleaning tanks, after which they pass to their own appropriate section.

After overhaul, the car is assembled and passes out of the shop on a track on the southern end of the building.

After the completion of construction, it is the intention of the management to plant the area in front of the shops with shrubbery and flowers, so as to make the approach attractive.

Making Certain That Field Coils

Are Assembled Correctly

Motors with a main field coil or a commutating field coil reversed will have poor commutation with resultant overheating and flashing. Some simple precautions will insure that all connections are made properly

By Jesse M. Zimmerman

Maintenance Sales Engineer Westinghouse Electric & Manufacturing Company

LACK of proper knowledge of assembling field coils in the motor frame has caused many motor failures. If one or more of the main field coils are connected so the current passes through them in the wrong direction the total magnetic field flux will be decreased. This will cause the motor to turn at a higher speed than normal and when placed under a car it will hog the load, so that the armature soon will roast out. Motors having field control are connected up wrong even more easily. Reversed commutating field coil connections cause the motor to commutate poorly and flash easily.

In the non-commutating pole motor there is ample room to bring the leads of the field coil out of the side near the end. The advent of field coils with cable leads has made it easy to trace the winding in the coils. This type of coil, shown in Fig. 1,* is known as the open coil with side end leads. The wiring around the frame is on the commutator end of the motor, as shown in Fig. 5.

The commutating pole type of railway motor usually has four commutating poles. The space between the coils is so small that the leads must be brought out at the front end of the coil. The wiring around the frame may be simplified and loose crossing of the main field connections eliminated by using alternate open and crossed main field coils with front leads, soldered and tied inside of the coil. However, it is very important that the principle used in these coils be understood thoroughly and that they be connected carefully to obtain the proper polarity. Open and crossed types of coils are thus explained:

1. The open coil with front leads shown in Fig. 2 has the cable connected to the end of the field coil, so that the cables and the conductors to which they are connected are less than a full turn. It is marked by a letter O to identify it. Unless this identification is preserved, the coil is liable to be used as a crossed coil, thereby reversing the polarity.

2. In order to alternate the direction of the flow of current through adjacent field coils without reversing the external connections the crossed field coil is used. The cable leads are so connected to the coil ends that the cables and the conductors to which they are connected complete more than a full turn. It received its name because the cable leads cross inside the coil.

**All field diagrams show coils as laid out on a work bench with the armature side up. All diagrams of coils assembled are shown looking at the commutator end.*

The method of placing the open and crossed main field coils is shown in Fig. 6. Here the wiring around the frame is done at the commutator end. With this type of connection the commutating coils may either be open with front cable leads, or have front and rear cable connections.

Due to mechanical limitations it often is necessary to make part of the main field coil connections at the pinion end of the frame. This necessitates the use of the

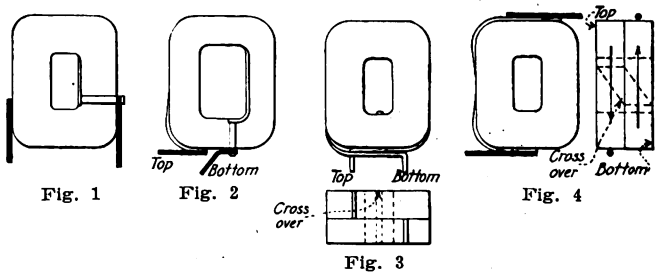

Fig. 1 Fig. 2 Fig. 3 Fig. 4

Fig. 1—Open type field coil with side end leads
Fig. 2—Open type field coil with front end leads
Fig. 3—Closed type field coil
Fig. 4—Strap-wound field coil with front and rear leads

front and rear connected main field coil shown in Fig. 4. The open type of commutating field coil is used. First the two north pole coils are connected together, then they are connected to the south pole coil to the AA side of the armature. See Fig. 7.

Sometimes only two commutating poles are used. This type of motor generally uses the open type commutating field coils with front cable leads. On some motors of this type the main field coils are all of the same type, the current being reversed through them by crossing the leads on the exterior of the coil as shown in Fig. 8. On others the front and rear cable lead construction is used. See Fig. 9.

The wiring around the frame of a motor having field control is very complicated. Therefore it is important that the internal wiring of the field coils be understood thoroughly so that correct polarity may be obtained. Coils designed for field control motors have two sections, namely: (1) Short or permanent field, which is connected continuously during the use of the motor and (2)

Digitized by Google

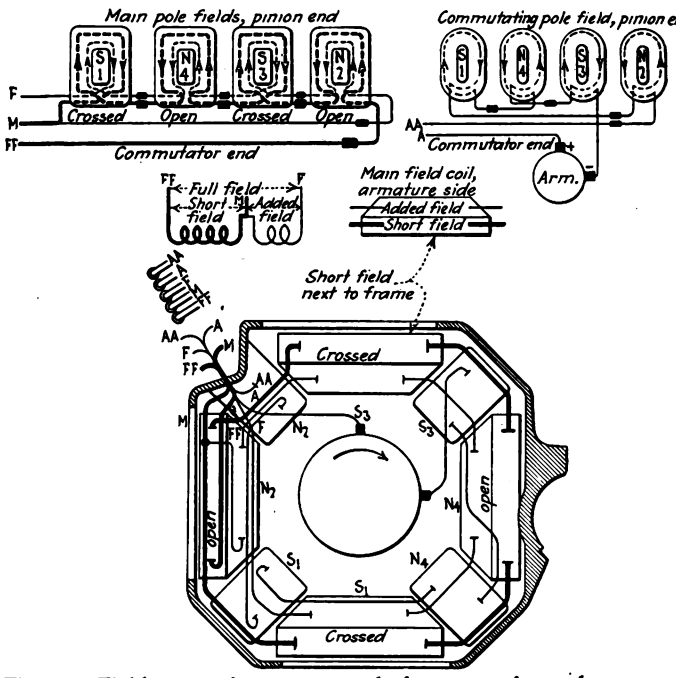

Fig. 11—Field connection on one end of commutating pole motor with short and added field windings

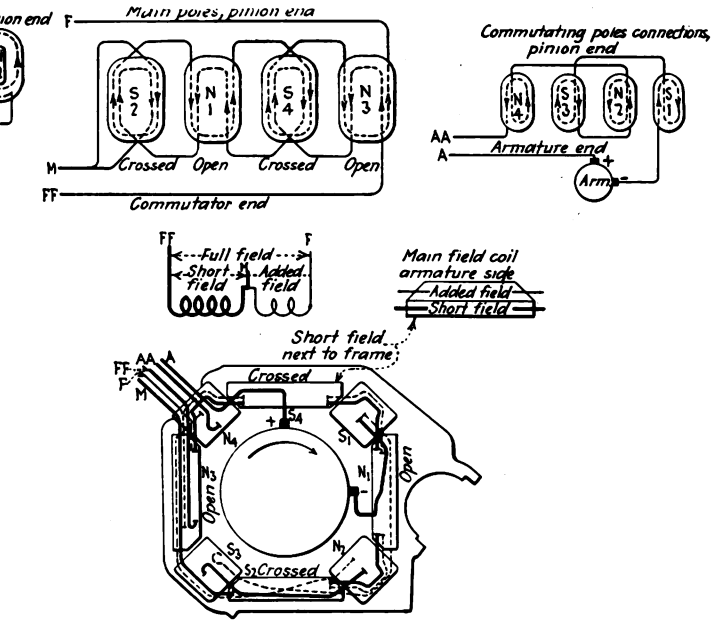

Fig. 12—Crossed and open construction used to reverse current in alternate coils

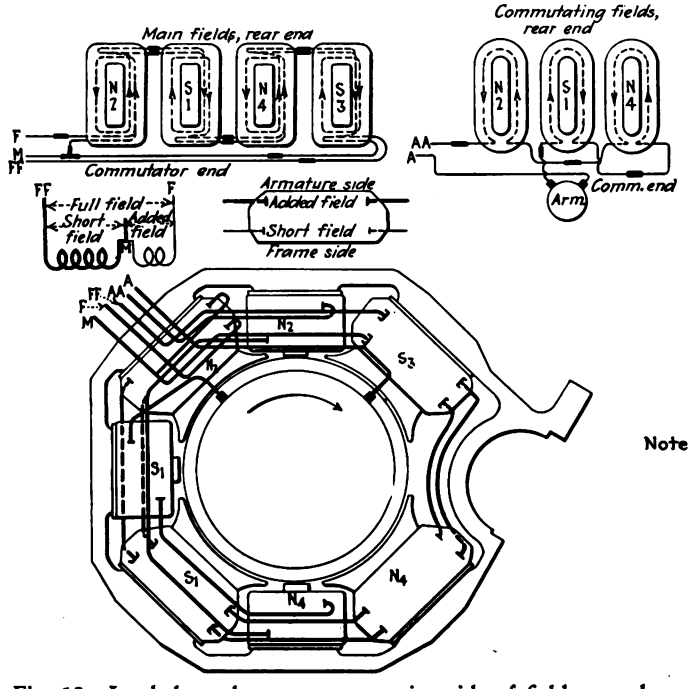

Fig. 13—Leads brought out on suspension side of field control motor

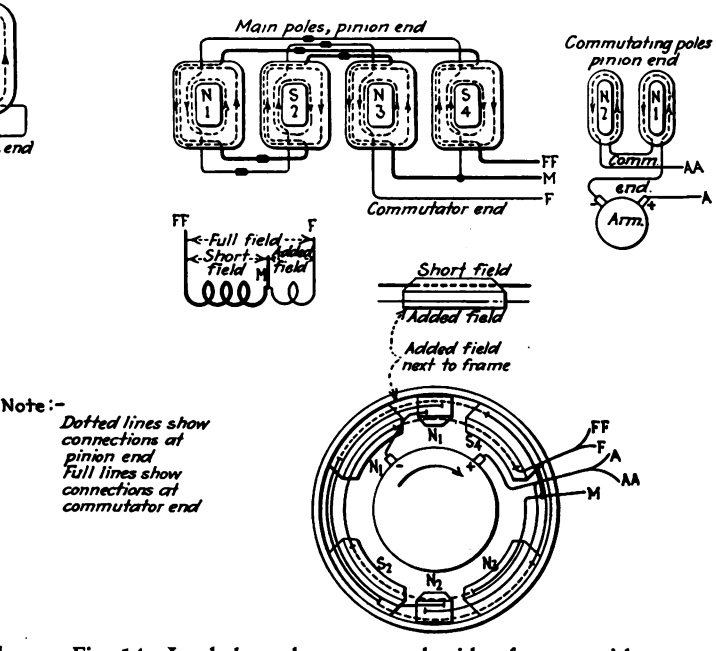

Fig. 14—Leads brought out on axle side of motor with two commutating field coils

additional field, which is used only to increase the field flux to give a higher torque at starting without excessive armature current.

The short field which is usually next to the motor frame, is shown in the schematic diagram by heavy lines because the size of the conductor is larger. The additional field is usually next to the pole face and is shown in the schematic diagram by lighter lines. Since this part of the field is used only during starting the size of the conductor can be made smaller in order to allow as much space as possible for the permanent section.

The short field and additional field leads are brought out at the front end of the coil, the current being reversed by using alternate open and crossed coils when the design permits. See Figs. 10 and 11. Where the design allows only a small space it is necessary to bring the short field leads out of one end of the coil, while the additional field leads are brought out at the opposite end. The crossed and open construction is used to reverse the current in alternate coils, as shown in Fig. 12. The front and rear method of bringing out the leads on field control motors seems very popular where it is necessary to use only two or three commutating poles. See Figs. 13 and 14. The design and method of connecting the commutating field coils for these different types of main field windings are shown in their respective diagrams.

There are several necessary precautions to follow when connecting up the coils in a field control motor. They are:

1. After the coils have been connected the polarity of the permanent field M-FF and of the addition field F-M should be checked separately to make certain that the

Digitized by Google

polarity of the two parts of the main field are the same.

2. A check should be made to ascertain that the additional field FM is cut out for high running speed.

3. The additional field can not be distinguished from the short field by checking their resistances, as these results may be misleading. Sometimes the additional field may have a higher resistance than the permanent field, due to the difference in the copper cross sections.

4. The coil should be placed in the frame according to the diagram supplied by the manufacturer. Usually the permanent field is next to the frame; however, sometimes it is next to the armature.

Testing for Reversed Field Coil Connections

When the field coils are connected in the motor frame, a check is necessary to see that the current passes through them in the correct direction. If they are not connected properly the motor will tend to rotate at a higher speed, thereby taking more than its share of the load. The test can be made by passing current through the main field coils while holding a compass to the corresponding end of each coil and noticing which way the needle points. The polarity of the commutating poles should be checked in the same manner under a separate test. If the polarity of the main end commutating coil fields have been checked it is necessary then to check the polarity of the two poles together. If the motor does not have an armature in the frame it will be necessary to short-circuit the brush-holders. The negative side of the armature should be connected to the positive side of the main field, the negative side of the main field to ground and the positive side of the armature to trolley through a suitable resistance to limit the current. The polarity of the main pole should be the same as that of the commutating pole next to it in the direction of rotation when facing the commutator end of the motor.

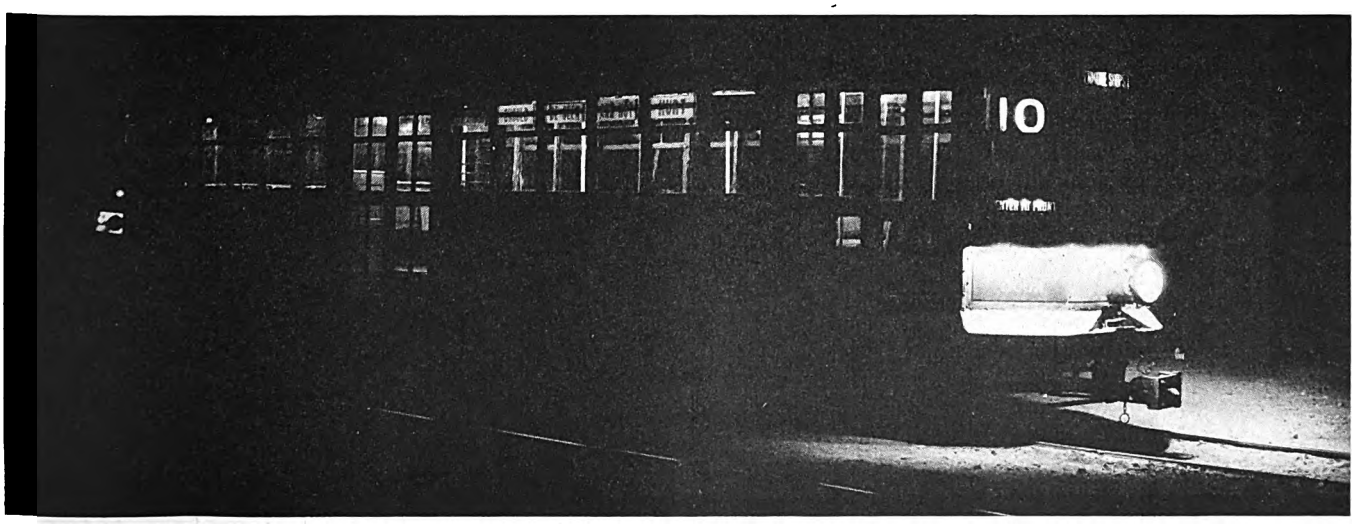
Polarity may be tested by use of two iron rods with long wooden handles fastened to their centers. After the fields have been energized with a small current the ends of the rods are placed on two adjacent pole tips. If the rods are drawn together the polarity of these poles is opposite. If there is no attraction the polarity is the same. Therefore, when testing for polarity of adjacent main field poles the rods should be attracted to each other. But when testing to see if a main and commutating pole are of the same polarity there should be no attraction between the iron pieces.

The reflector containing five 100-watt lamps is mounted under the belt rail of the car

Dash Lighting Attracts Attention

GLARE from powerful headlights such as are used frequently on interurban cars is objectionable on city streets. On the other hand, the headlights ordinarily used on city type cars are dull and dim and in stormy or foggy weather can hardly be seen.

The Northern Ohio Power & Light Company, Akron, Ohio, has developed a scheme of front illumination which not only makes the car visible in bad weather but adds considerably to the attractiveness of the car's appearance during the night hours. A covered-type reflector has been mounted under the belt on the front end of each car. In this reflector, which is made of 16-gage metal, are mounted five 100-watt lamps. It is so shaped as completely to conceal the lamps from the eye, thus eliminating any direct glare but illuminating the entire front dash of the car. As the standard color of the cars is orange the illumination gives a pleasing effect.



The effect at night of the illuminated dash on the Northern Ohio cars

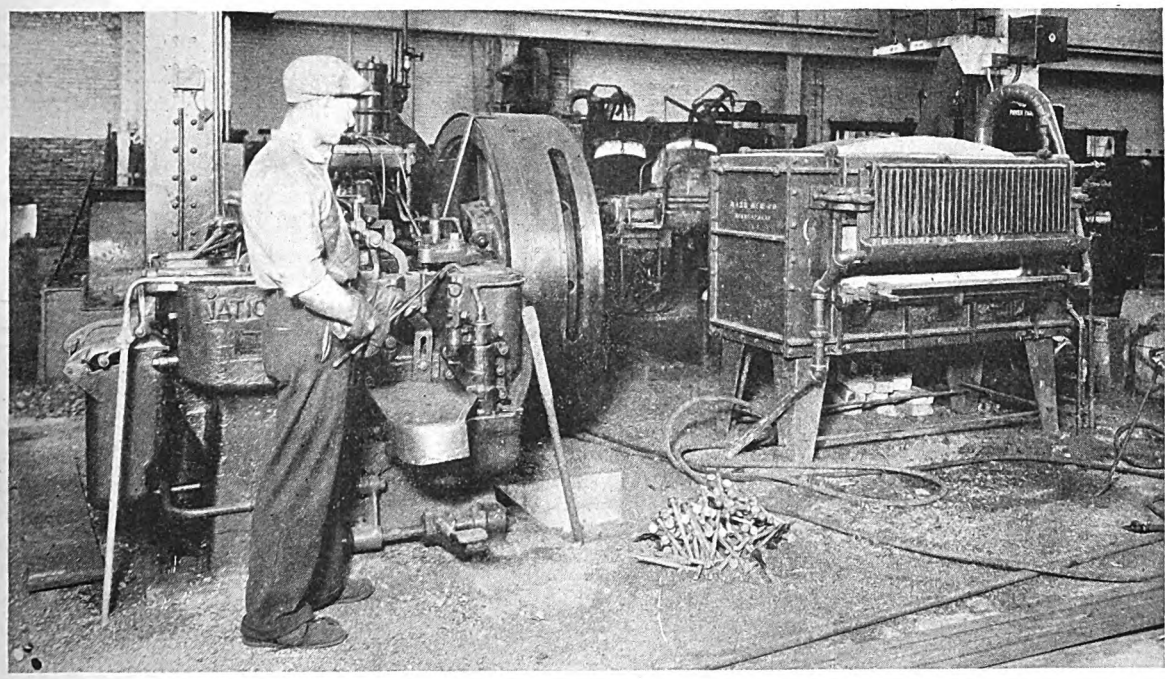
Modern Tools

Make Forge Shop Attractive*

By *Clarence W. Squier*
Associate Editor *Electric Railway Journal*



A heading and upsetting machine is used for forming special bolts, rivets and putting heads on long bars. The furnace for serving this machine is shown at the right

In Coney Island shops of the Brooklyn-Manhattan Transit Lines heavy forgings are made with air hammers, bending and shaping of large parts is done with bulldozers and bars are cut with a punch and shear. Oil furnaces heat material for all heavy operations

BLACKSMITH shops of most electric railways are hot and dirty. An exception to such is that of the Brooklyn-Manhattan Transit Lines at the Coney Island shops. An efficient system of forced ventilation keeps the department cool even on hot days and the forges are of the latest design. Electrically driven blowers furnish the draft and all smoke is removed by an exhaust fan connected through underground ducts to hoods over the fires. Skylights in the roof make the department very light even on dark days. Drinking fountains and shower baths add to the comfort of the workmen, especially in hot weather.

The blacksmith shop occupies a floor space 200x80 ft. and the floor is of cinders around the forges and working tools, but two wide trucking aisles of concrete extend across the shop. The west side has a cement floor 10 ft. wide. The section around the electric welding booths also has a floor of cement. As all material is handled into and out of the department by electric trucks the cement flooring makes rapid movement possible.

The department storage for iron and steel is just outside. A space 7x20 ft. is used for this. There are two iron and steel racks, one 14 ft. 1 in. by 20 ft. by 7 ft. 3 in. and the other 18 ft. by 20 ft. by 7 ft. 3 in. The space adjacent to the racks is provided with an overhead traveling crane and heavy material is also handled very efficiently by electric crane trucks.

As mentioned in the previous articles describing equipment and methods used in these new shops, departmental storage of material and supplies is an outstanding feature. In the forge-shop section a space 20 ft. wide and 200 ft. long just outside the west wall of the shop is used for storage of blacksmith material. Coal is kept in two rooms with openings both outside and into the forge shop. The steel metal racks present a neat appearance and give convenient access to the material. Various special dies and tools used in the many

*This is the sixth article describing methods and equipment of the Coney Island shops of the B.-M.T. Lines. Others were, "Truck Overhauling," published April 21, 1928; "Intermediate Truck Repairs," published May 5, 1928; "Wheel Gear and Axle Maintenance," published May 19, 1928; "Motor Overhauling," published June 16, 1928; and "Bearing Practice," published July 21, 1928.

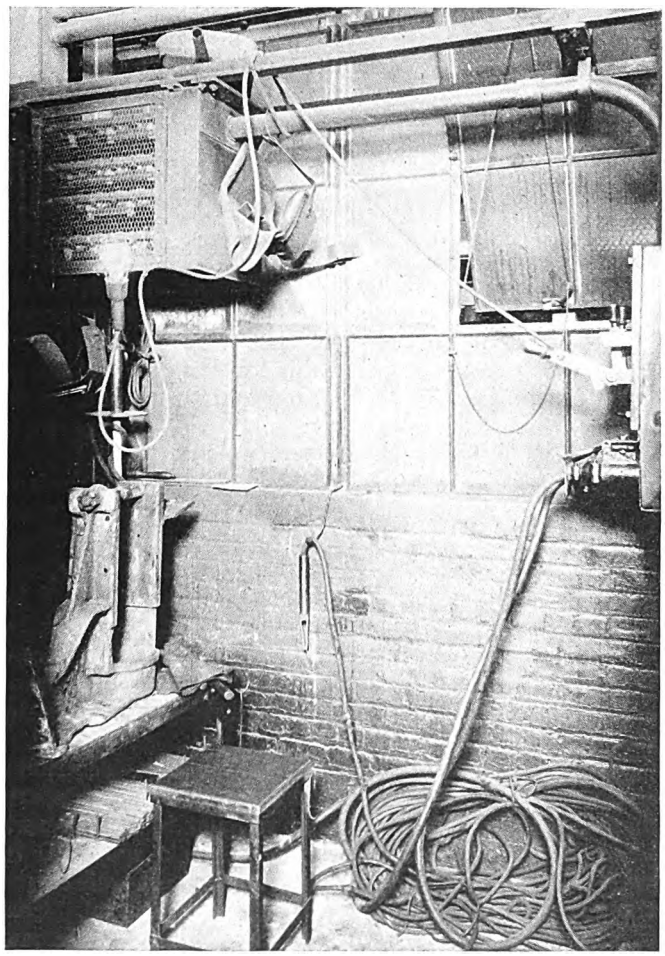
forging operations are kept close at hand in specially designed tool racks.



Interior of one of the electric welding booths. Control switches are shown at the right. Long leads can be plugged in so that welding repairs can be made at a considerable distance outside

In providing the equipment for the blacksmith shop the fact that repair work is the major requirement has been kept in mind. Most of the work done consists of filling in and building up worn surfaces, cutting out and setting in new sections in various parts and putting new ends on rods and levers.

A typical job with several operations, that of shaping a truck equalizer bar, illustrates the need for some of the equipment. Bar stock 6x1 in. is taken from the material racks to the punch and shear where it is cut to proper lengths. These go next to a furnace for heating and the center section is drawn to 5x1 in. under a steam hammer operated by compressed air. The ends are left 6 in. wide to provide necessary stock at corners of the curved sections. Next the ends are heated in a furnace and are shaped in a bulldozer. Then the bars are placed on a face plate and the sides are hammered at any points that are not absolutely true. They go next to the blacksmith forges and anvils to be trued up, and then into an annealing furnace. Small fractures are detected readily while the iron is hot but extra precautions are taken with parts that must withstand heavy loads. These are tested by dipping in oil, wiping this off carefully and then painting with whiting the same as was described for testing axles in a previous article on methods in these shops.

The punch and shear was manufactured by the Schatz Manufacturing Company, Poughkeepsie, N. Y. It cuts plates up to 1 in. thickness, shears $1\frac{3}{16}$-in. plates and flat bars, round bars, angles and special sections. Holes are punched up to $1\frac{3}{8}$ in. in plates 1 in. thick.

Furnaces for heating, annealing, case hardening, tempering, etc., form an important part of the equipment for the blacksmith shop. There are nine of these now in use and the shop layout provides for additional ones to meet future needs. Furnaces are provided for serving the hammers, bulldozers, heading, upsetting, and forging machines. Each furnace was selected for its particular service. Some are double-ended, others single-ended. A

Digitized by Google

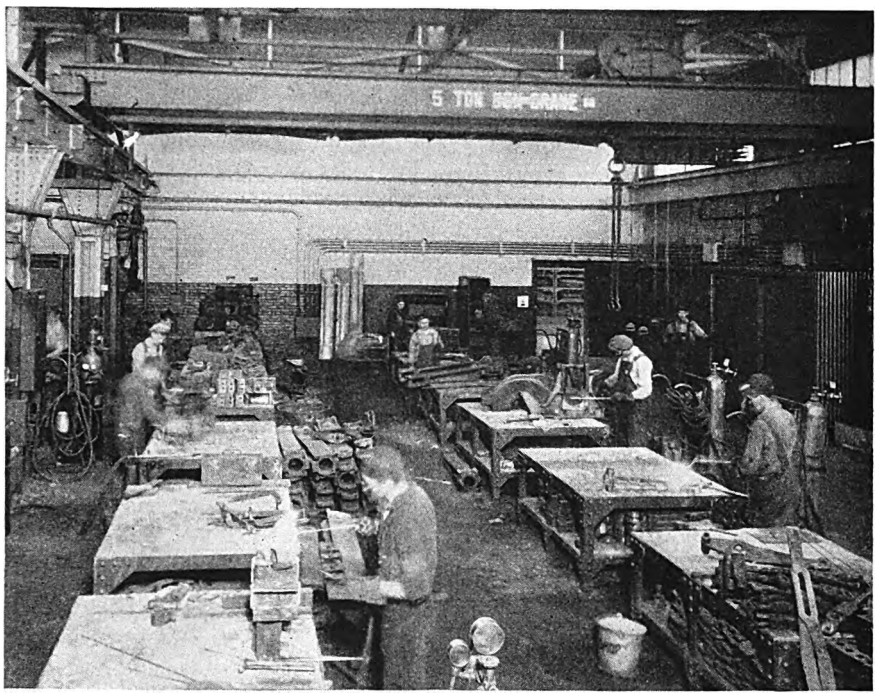
double chamber tool furnace is used to temper the special steels used for high-speed shop tools. Pyrometer equipment for this furnace records the furnace temperatures and insures the right working temperature for each kind of steel. Material can be heated to 3,000 deg. F. if desired. Oil and water quenching tanks are used in this work.

A large annealing furnace is arranged so that material can be placed on cars and be run into and out of it for easy handling. Another furnace 5 ft. by 2 ft. is used for heat-treating various materials. These furnaces are equipped with recording pyrometers to give accurate heat records.

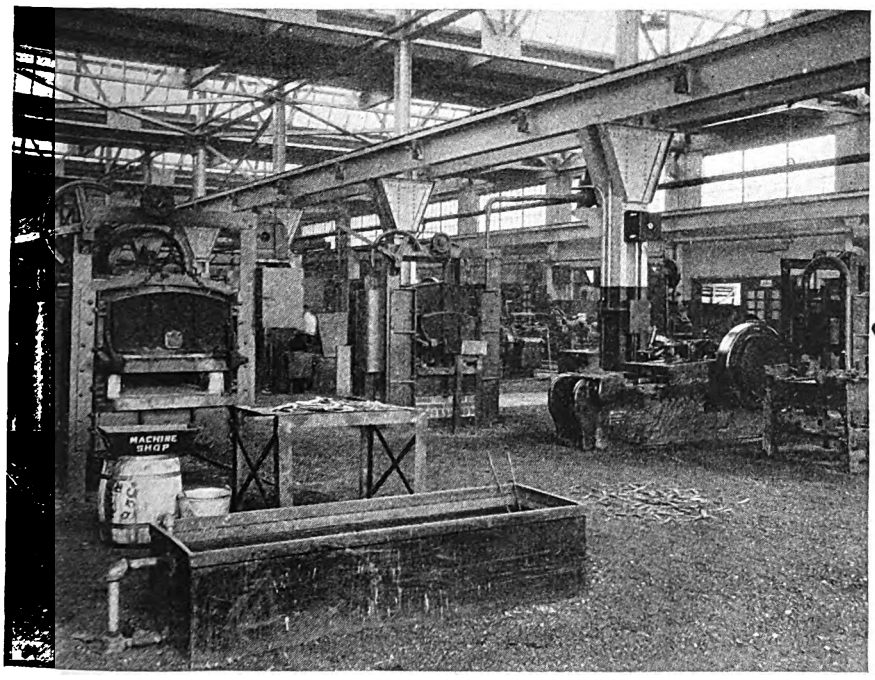
All furnaces were furnished by the Mahr Manufacturing Company, Minneapolis, Minn., and each has its own electrically driven blower. The sizes of the nine furnaces are as follows:

Heat treating furnace	15x24x48 in.
General work furnace	12x24x36 in.
Small bulldozer furnace	12x18x24 in.
Hammer furnace	12x18x24 in.
Case hardening furnace	12x24x60 in.
Bolt forge furnace	12x18x30 in.
Large bulldozer furnace	15x24x72 in.
Tool furnace	12x16x20 in.
Annealing furnace	24x72x96 in.

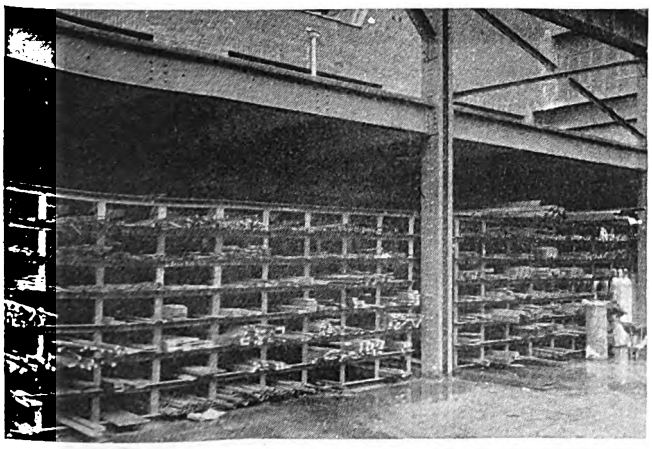
Fuel oil is burned in all furnaces. It is stored in two 5,300-gal. underground tanks in the yard and from these it is pumped through underground pipes with branches to the burners of each furnace.



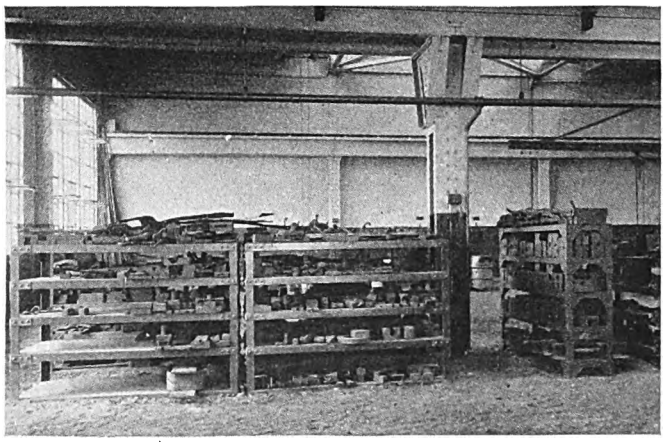
A group of furnaces in the Coney Island shops. The case hardening furnace with tempering trough is shown at the left. A small bulldozer is in the center and a furnace for serving the high speed hammer is at the extreme right



Welding repairs by acetylene are made on brick-topped welding benches. A shelf on the underside of these provides convenient storage space



Bar material for use in the blacksmith shop is stored conveniently just outside the department



Various dies and special tools used in the blacksmith department are stored in racks convenient to the machine tools

Digitized by Google

There are twelve Buffalo down-draft forges. Eight of these are 42 in. square and four are 48 in. square. Water boxes, fuel bins and electrically-driven blowers are provided for each. Soft coal is used for fuel but the exhauster draws the smoke away from the fires and leaves the air clear and fresh.

Forgings which are too heavy for hand work are handled by three McDougal-Potter steam hammers. Compressed air at 90 lb. pressure, furnished from the shop air compressors, is used for operating these. Two of the hammers are of 900-lb. capacity and one of 1,200-lb. The hammers rest on timbers supported on concrete foundations, and separate cushioned foundations are provided under the anvil blocks.

Shaping and forming of bars and rods are done with two Ajax bulldozers. One of these is a long-stroke, slow-speed type for bending heavy sections and the other a high-speed, short-stroke and stop-motion type for light work.

A National forging, heading and upsetting machine is used for making all kinds of special bolts and forming the heads on special rods. It handles work up to 1½ in. diameter. This machine is equipped with dies to forge bolts and rivets of various lengths and sizes. The operator feeds a hot bar into the machine and at each push of the pedal a complete part drops into the pit.

Both electric and gas welding have wide applications in the repair work done in the blacksmith shop. There are twelve brick-topped tables for gas welding and five welding rooms are used for electric welding. Two of these rooms are 6x10 ft. and three rooms are 6x7 ft. Each room has a welding bench and a stool for the workman. Above the bench at one end are the resistors and control of the welding current is by switches within easy reach of the operator. The front of each room has a sliding door, so that other workmen are protected from the glare of of the electric arc. Special receptacles are provided to plug in cables for supplying the welding current. Work is done outside the booths by using long leads and lines run to other departments so leads can be plugged in and welding repairs made there.

Equipment is handled to the hammers and forges by four jib cranes and a 5-ton, floor-controlled, electric traveling crane operates over the welding benches.

Toronto Campaigns for Clear Car Tracks

PLEADING for an unobstructed track, the Toronto Transportation Commission, Toronto, Ont., has published a series of pictorial advertisements in the local papers. Since the series of advertisements was in the nature of an appeal from the car riders to the drivers of vehicles and others concerned, the name of the commission was not featured.

LINE DEPARTMENT—8

Reinforcing Steel Poles*

By H. G. Engelhardt

Engineer Railway Overhead Line Department
New Orleans Public Service, Inc., New Orleans, La.

CORROSION that will render a steel pole unfit for a particular class of service is hard to determine A local study is needed to determine the time when a corroded pole should be renewed, and the characteristics of loading of the particular pole must be taken into account. As a precautionary measure, the New Orleans Public Service, Inc., has adopted a very simple and inexpensive method of reinforcing steel poles.

Before setting the pole, a piece of worn T-rail 9 ft. long is inserted in the butt section. A wooden plug is driven into the butt and the pole is set 6 ft. deep, in the usual manner.

Reinforced steel pole which has corroded entirely away at the base and still keeps in alignment

After setting, a very wet 1 : 3 : 5 mix of cement, sand and gravel, sufficient to surround and cover the rail completely, is poured into the pole from the top. This method of reinforcing can also be used on existing poles by dropping the rail through the top.

Reinforcing in this manner will eliminate any danger of a pole breaking off and falling. If the strain and the corrosion at the base of the pole are sufficient to cause a failure, the rail will bend but not break. A pole thus deflected is detected easily and can be replaced with very little trouble and without great expense.

TRACK AND WAY DEPARTMENT—32

Keeping Moisture Out of Track Switch Coils*

By Charles Herms

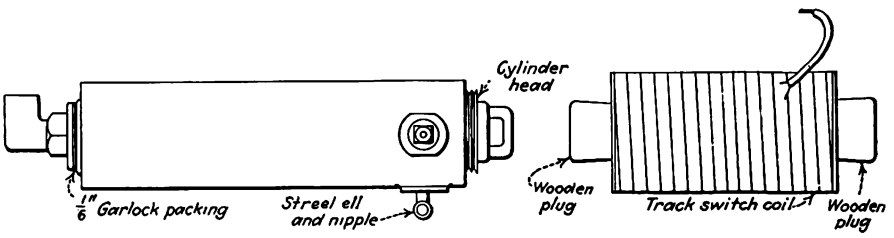
General Foreman San Diego Electric Railway,
San Diego, Cal.

CONSIDERABLE trouble was experienced from magnet coils of Cheatham electric track switches on the lines of the San Diego Electric Railway becoming short circuited and burnt out due to moisture getting into the switch cylinder. Various tests and methods were tried for keeping the moisture out and finally the following one was adopted.

Coils are dipped and baked. Westinghouse No. 335 varnish is used. To keep the varnish out of the coil core, a tapered wooden plug is slipped on to each end. The brass nut is sealed on the plunger by use of Garlock packing.

The conduit connection on the side of the cylinder was a frequent source of trouble. This was filled with General Electric Company's No. 227 sealing compound. This makes a perfect seal, which remains intact in all weathers. The compound will not run in hot weather, or crack when cold. Coil failures have been reduced 70 per cent since this method of treating the various parts was started and delays to service are avoided.

The accompanying sketch shows a cylinder and operating magnet coil for a Cheatham electric track switch as developed on the property.



Cylinder and operating coil for electric track switch

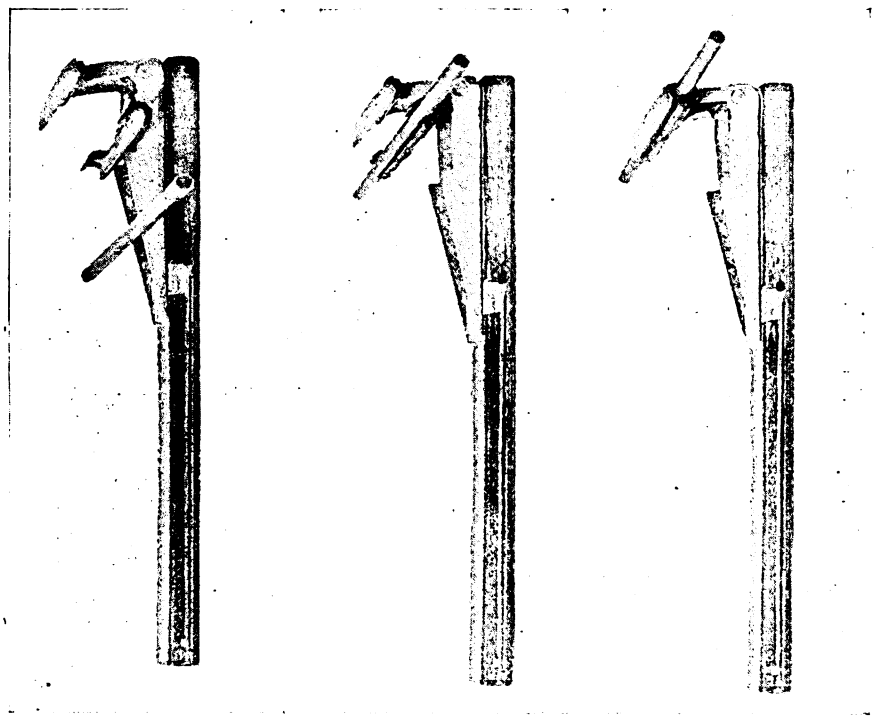
Trolley Hook Connector for Portable Equipment*



By GEORGE E. MCEWEN
Electrician Way Department
Toronto Transportation Commission,
Toronto, Canada

A TROLLEY hook connector which allows uninterrupted passage of trolley wheels and which can be applied readily at any point on the wire is used on the lines of the Toronto Transportation System, Toronto, Canada. As shown in the accompanying illustration, the guide on the hook is drawn down over the trolley wire so that it enters a locking lever. A further pull brings the hook into operating position. The wooden pole is then drawn over to the side of the roadway and tied up high enough to clear vehicular traffic.

The hook is cast in bronze and is fashioned so that direct contact is made through the body of the casting and not by way of the locking lever joint.

At left—Trolley hook being applied to wire. Guide placed over trolley wire. In center—Hook drawn down over the wire so that it enters the locking lever. At right—Trolley wire clamped in locking lever

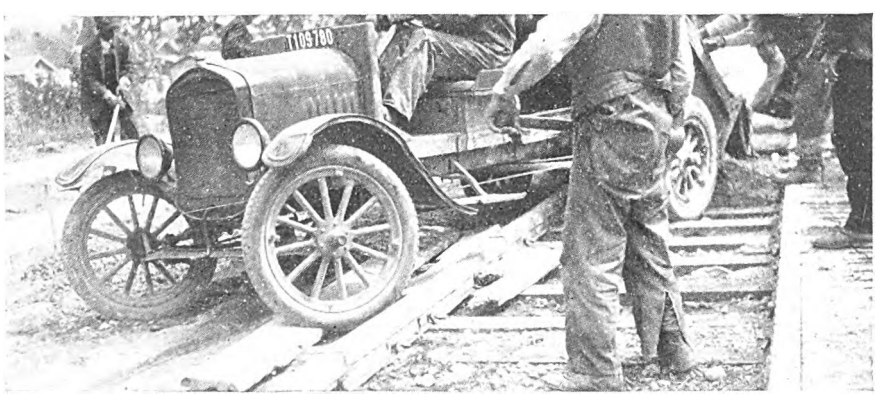
TRACK AND WAY DEPARTMENT—33

Protecting Rail Filler*

By D. H. WALKER
Chief Engineer Terre Haute,
Indianapolis & Eastern Traction Company,
Indianapolis, Ind.

IN SEVERAL locations streets occupied by tracks of the Terre Haute, Indianapolis & Eastern Traction Company have been paved by the city or county from curb to curb, including the track area. In such cases the railway track is prepared to receive the paving laid by the contractor. Usually this pavement is a monolithic concrete slab and rail filler is used to protect the paving.

Guards over rails prevent the trucks from knocking out or breaking down the filler



Concrete is placed directly from the paver bucket to the track area

While the concrete is being poured it is essential to maintain the rail filler tightly against the rail and to prevent the concrete from forcing its way between the filler and the head of the rail.

A small sheet metal guard is applied over the rails. This is made in U shape to fit over the head of the rail and extends down far enough on either side to prevent entrance of material between rail and filler. The guards are about 8 to 12 ft. long of No. 20 gage metal and easy to handle.

POWER AND ELECTRICAL DEPARTMENT—5

Field Coil Changing Device*

By H. Kowin

Electrical Department Toronto Transportation Commission, Toronto, Canada

WHEN changing defective field coils on a rotary converter difficulties arise owing to the confined space and the awkward angles at which they have to be taken out and replaced. The electrical department of the Toronto Transportation Commission has developed a device by means of which much time and labor may be saved.

This device consists of a clamp which fits around the coil and which is fastened by means of one heavy bolt to a hook-shaped bar. This enables the coil to be suspended at a point immediately above its center of gravity. The coil may then be slid out at the proper angle, and when a new coil has been placed in the clamp it is at exactly the correct angle to be slid back into place. The pole piece, during the changing of the coil, is held in its place by two adjustable dogs which are fastened to the clamp. This device enables a field coil to be changed in about one-half hour, where previously at least three to four hours were required for the operation.

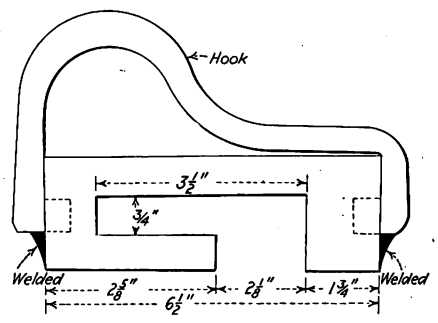
ROLLING STOCK—TRUCKS—28

Handy Attachment for Lifting Truck Frames*

By H. J. Beadle

Engineer of Equipment Dallas Railway & Terminal Company, Dallas, Tex.

FOR some time the truck foreman of the Dallas Railway & Terminal Company, Dallas, Tex., was confronted with the problem of doing away with the old-fashioned method of lifting truck frames by use of a chain sling, or hook, around the end angle frame of the truck. Often in putting a hook or chain over the end frame angle a sand pipe would be broken or bent. The difficulty was solved by use of the attachment shown in the accompanying illustration. A $2\frac{3}{8}$-in. steel bar is slotted and drilled with a $\frac{3}{4}$-in. hole at each end. A hook was forged and welded to the $6\frac{1}{2}$-in. bar. When this is attached to the truck frame, all the weight of the truck comes at the end of the device, due to its shape. It cocks to such an extent as to prevent slippage and so makes it safe and dependable. The tool slips over the end frame angle piece on the motor or trailer end of the truck, and the air hoist with its hook in the device does the lifting.



Handy attachment for lifting truck frame

OVEN DETAILS ARE IMPORTANT

From years of constant contact with the design, manufacture and operation of industrial ovens, our experience indicates that low cost oven operation is seldom the result of any spectacular design features, but rather the rational application of a host of engineering fundamentals—it is the careful co-ordination of all the seemingly negligible factors in oven practice that makes the big difference in fuel and labor costs after the installation is put in commission.

It may further be said from an engineering standpoint that knowing what not to do in oven practice is fully as important as knowing what may be done.

Oven building is a specialty that calls for a maximum of experience and engineering judgment.

Because of the high degree of specialization required, it has usually proven more desirable for the oven user to delegate to an organization of experienced oven engineers the entire layout and installation of all the elements that go to make up the baking department. In doing so he relieves his own engineering department of an unfamiliar task and at the same time is assured that the completed department will meet his specifications both as to quality of production and economy of operation.

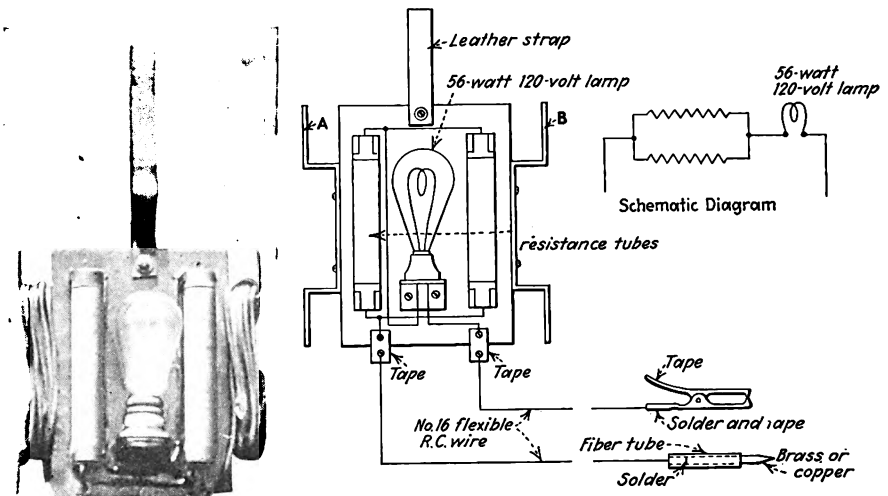
Convenient Lighting-Out Test Block*

By Arthur E. Clegg

Foreman Electrical Department San Diego Electric Railway, San Diego, Cal.

TESTING of electrical circuits and apparatus for short circuits and grounds is done conveniently by a lamp test block in the electrical department of the San Diego Electric Railway. Accompanying illustrations show the construction.

A 56-watt 120-volt lamp, together with two 22,000-ohm resistance tubes, is mounted on a block. The bottom is fitted with terminals for the leads, and the top has a leather strap to be used when the equipment is hung up. One lead has a test clip and the other a copper contact with a fiber handle, this latter being used for the testing. Side pieces designated as *A* and *B* in the accompanying sketch are used to wind up the leads so as to make the apparatus convenient for carrying.



At left, general view of lamp testing equipment. At right, details of construction of lamp tester used by San Diego Electric Railway

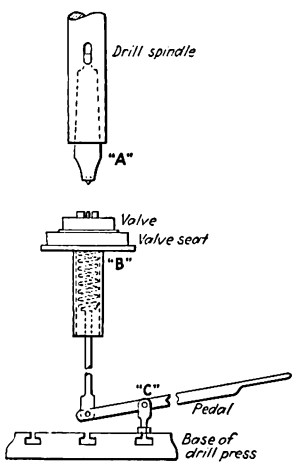
Drill Press Attachment for Grinding Rotary Brake Valves*

By E. C. Kelley

Shop Foreman Virginia Public Service Company, Hampton, Va.

GRINDING rotary brake valves by hand is tedious and expensive. Modern valve-grinding machines have improved matters, but in small shops where there is but a limited amount of this work a simple grinding device can be attached to a drill press. The accompanying sketch shows the equipment as used in the shops of the Virginia Public Service Company, Hampton, Va., which has given very satisfactory results.

The upper portion of the grinding tool may have a Morse taper shank or it can be held in a drill chuck. The lower portion is shaped like the bottom of the valve stem with the addition of a conical boss in the center to permit the valve to adjust itself to the seat and provide for equalization of the pressure on its face.



Equipment installed on a drill press for grinding rotary brake valves

The table to support the valve seat consists of a flat plate with a short piece of pipe attached. This forms a spring box and guide. The spring gives uniform pressure and flexibility to compensate for any inaccuracy in setting up. A pedal lever and connecting rod are used for raising the work into position. The fulcrum is attached to the base of the drill press and the connecting rod is aligned to the center of the drill spindle just above it.

When grinding a valve the operator depresses the pedal, which raises the work into position. The valve is rotated from the drill as the operator moves the valve seat in a circle. An average of from five to seven minutes is required to grind a valve unless it is very badly worn.

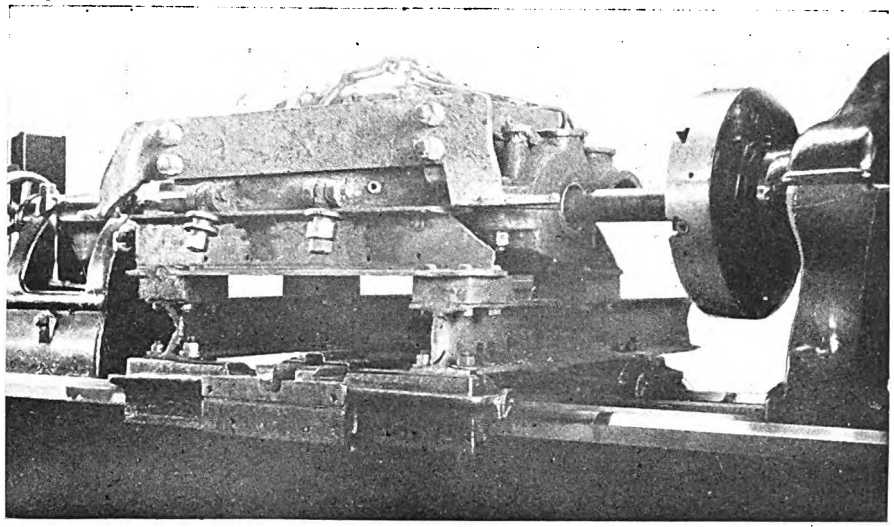
Boring of Motors Increases Bearing Life*

By C. B. Hall
Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.

EXCESSIVE wear on bearings, the resulting noise, brought about a gears and pinions, together with grave situation on the lines of the Virginia Electric & Power Company, Norfolk, Va. Study of the problem showed that reboring of the motors operated by the company was desirable as, in some instances, on the GE-210 motors there was from $\frac{1}{8}$ in. to $\frac{3}{16}$ in. play, and on the GE-87 motors as much as $\frac{5}{16}$ in. play.



GE-87 motor in position for reboring in the Norfolk shops of the Virginia Electric & Power Company

At first the work of reboring was awarded to an outside machine shop under contract, $20 per motor being paid. Later, a new lathe arranged for the reboring was purchased by the company, so that the remaining work was carried out at a cost of approximately $2.75 per motor.

The reboring solves the difficulty in excessive wear of bearings so that now the service obtained has been increased from three months to three years. Decreased wear has also resulted on gears and pinions, and the noisy condition has been overcome.

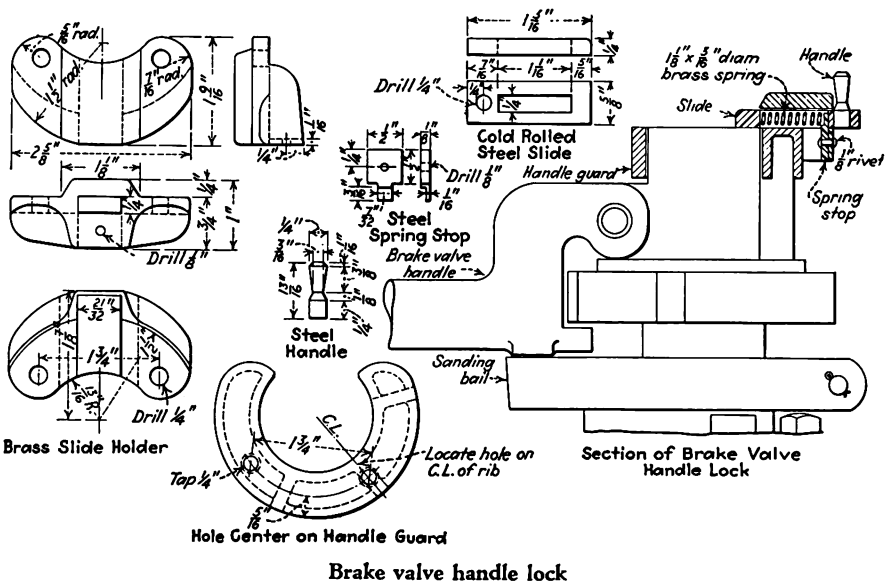
Making Sanding Easier*

By W. H. McAloney
Superintendent of Equipment Georgia Power Company, Atlanta, Ga.

WHEN the brakes were set with the M-28 brake valves with sanding features, continuous difficulty was experienced in sanding the rail on lines operated by the Georgia Power Company. This was due to the handle socket for the brake valve hitting against the handle guard, and the handle body rubbing against the latch cam. To overcome this difficulty, a lock was devised to prevent any excess vertical motion of the handle socket.

The lock consists essentially of a slide which extends partially over the top of a handle socket, the slide guide, which is fastened to the top of the handle guard, and a spring to hold the slide in position as shown in the accompanying illustration. By pushing the slide forward, the brake handle can be put on or removed easily. This device has proved very satisfactory. Details were worked out by J. H. Squires, machine shop foreman of the company.



Brake valve handle lock

Prize Winner for July Is E. C. Kelly

Shop foreman of Virginia Public Service Company gets $25 monthly prize for July in *Electric Railway Journal's* maintenance contest for his description of a truck for handling car wheels and axles. H. S. Williams of Detroit receives honorable mention for adjustable pit light

SOME simple, durable, light conveyance for handling the heavy wheels and axles used by street cars is a desirable adjunct to any electric railway shop. A two-wheeled truck arranged for handling such material is used by the Virginia Public Service Company of Hampton, Va. A description of this by E. C. Kelly, shop foreman, was awarded the $25 monthly prize for July, by the judges in ELECTRIC RAILWAY JOURNAL'S maintenance contest. The common method of rolling the car wheels is interesting to watch when performed by a skilled operator. But accidents sometimes occur and it requires a considerable knack to be able to handle wheels efficiently in this manner. The truck for handling car wheels and axles, as used in the shop of the Virginia Public Service Company, requires no particular skill from the workman, and wheels and axles can be handled quickly by one man.

An adjustable pit light, as described by H. S. Williams, assistant superintendent of equipment Department of Street Railways, Detroit, Mich., was awarded honorable mention by the judges. This is a simple contrivance but one which fills an urgent need.

Although the time for submitting items eligible for the $25 monthly prize expired at midnight on July 31, the JOURNAL will continue to pay $5 each for maintenance ideas submitted and accepted for publication. In addition to the July prize which was awarded to Mr. Kelly, the judges will be asked to select the best of the items published in this issue and in the other issues of the JOURNAL since the July maintenance number. The material was all submitted before July 31, and therefore an additional award of $25 will be made and announced in September.

PAYMENT FOR ITEMS CONTINUES

There is still on hand a considerable number of items submitted in the contest, most of which are, nevertheless, first-class maintenance ideas that offer valuable suggestions for application in the shop, track or electrical departments. These will be published as fast as space permits, and the author of each item will be entitled to the regular payment of $5 per item.

The maintenance contest has shown what a wealth of ideas are available in the industry. It has also served to impress upon maintenance men themselves the value of establishing the habit of interchanging their own practices with other properties throughout the country, through publication in the pages of the JOURNAL. Although the contest has brought to light many "shop kinks" that were ingenious and new to most of the industry, there is still a great wealth of this material that remains unpublished because the man responsible for the idea has never thought it worth while to send it to the JOURNAL.

It is therefore to be hoped that the habit established by many maintenance men through this contest will be continued. Many new devices and methods are being developed every day. Send these to the JOURNAL. It is a good plan for department heads to discuss this subject with the foremen, either individually or at staff meetings. Take a photograph or make a sketch illustrating the construction and operation of the device or the method of carrying out an unusual maintenance operation. Write a letter telling about it. This can be in long hand if a typist is not handy. Sketches may be in pencil or blueprints. They do not need to be finished drawings. All that is necessary is that they illustrate clearly the construction or operation of the device. Mail your material to ELECTRIC RAILWAY JOURNAL, Tenth Avenue and 36th Street, New York City, and the JOURNAL editors will do the rest.

E. C. Kelly

Edgar C. Kelly, who is awarded the monthly maintenance prize of $25 for July, is at present shop foreman of the Virginia Public Service Company at Hampton, Va. He is a veteran of railway work, with some 30 years of practical experience on several properties.

Previous to his present position with the Virginia Public Service Company, Mr. Kelly was master mechanic of the Chester, Kennett & Wilmington Railway & Electric Company. Before that he occupied the same position with the Hampton Roads Traction Company. His first connection with the Virginia Public Service Company was in the position of head electrician and pit foreman in the company's car shops.

Mr. Kelly takes a keen interest in the improvement of electric railway practice and in group activity for bringing about greater teamwork among the men of several departments. Some ten years ago he served several terms as chairman of Company Section No. 10 on his property. He is a native of Huntingdon, Pa. After obtaining a public school education he took a course of study at the Coast Artillery School, Fortress Monroe, Va.

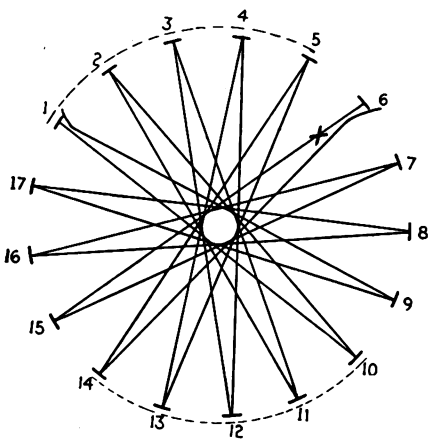
PRACTICAL HELPS *for the* Armature

Elimination Method of Locating a Ground

ONE method of locating a ground on a four-pole, series-connected armature, is to eliminate the coils that are not grounded by subdividing the armature coil in sections and testing each section with a lamp circuit. The entire winding is first divided into two insulated sections, and the section containing the fault determined with a lamp circuit. This section is subdivided into two insulated sections and another test is made. The subdividing is continued until the possible field of fault is reduced to a single coil connected at one end to a single bar.



Connections for a four-pole, series-wound armature

The winding is separated into insulated sections by lifting top leads from the commutator at the specified points. On a multiple-connected armature the lifting of two diametrically opposite leads will divide the winding into equal, insulated, halves. On a series-connected armature, however, the two leads to be lifted first are approximately on the quarter.

The accompanying diagram shows, conventionally, the connection of a four-pole, series-connected armature as used in railway motors. Assume that a ground exists at *X* and it is desired to locate the faulty bar or coil. Lifting any two top leads that lie on the quarter, the top leads of bars 1 and 6, for example, divides the winding into two sections. One of these sections includes bars 1, 10, 2, 11, 3, 12, 4, 13, 5, 14 and their dependent coils. The other section includes bars 9, 17, 8, 16, 7, 15, 6, and their dependent coils. All bars of the first or faulty section, as indicated by the broken line outside of the bars in the illustration, are marked with a chalk line, and are to be ignored in subsequent tests. Lifting the top lead from bar 16, the faulty section is divided into two subsections, one of which includes bars 8, 17 and 9, and the other of which includes bars 16, 7, 15 and 6. On testing, the latter group is found to contain the fault. The remaining top leads are now lifted and the field is finally limited to bar 6 and a bottom lead. Lifting this bottom lead and testing it and bar 6 determines the coil of that lead as the one containing the fault.

Locating Short-Circuits by the Bar-to-Bar Test

IN A bar-to-bar test for short circuits and open circuits, current is passed through the armature by means of spring contacts that touch the commutator on the quarter, 90 deg. apart, just as the brushes do when the armature is in operation. With current flowing, test points from a voltmeter are touched successively to all parts of adjacent bars, the armature being turned through 360 deg. in the course of the test.

In the accompanying conventional diagrams, one of the paths through an armature is represented. The diagonal lines represent the armature coils, while the short horizontal lines represent the commutator bars. The bars numbered 1, 2, 3, 4 and 5 are diametrically opposite from the corresponding bars, lettered a, b, c, d and e. As may be seen, it is necessary in passing from any bar to an adjacent bar, to pass through two coils in series.

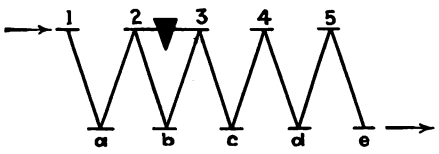


Fig. 1—Short-circuit between commutator bars

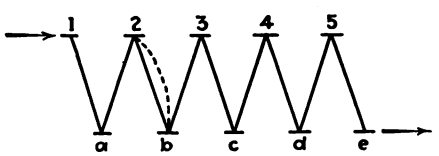

Fig. 2—Short-circuit in one of the coils

In conducting the test, if all coils are alike and the commutator has no defects, all deflections will be the same as the test progresses around the commutator. However, with a dead short between two bars, as indicated between bars 2 and 3 in Fig. 1, a zero reading will result when the voltmeter is connected to bars 2 and 3. With a partial short between the two bars, a deflection less than normal will be obtained.

If a coil is shorted, as indicated in Fig. 2, a deflection less than normal will result when the voltmeter test points are touched to bars 2 and 3 and also to the bars a and b on the opposite side of the commutator.

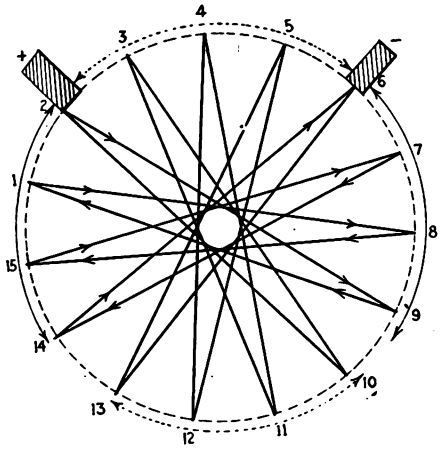
Two Armature Paths Are Same Length

CONTRARY to the belief of many electrical repair men, the two electrical paths in a two-circuit or series-wound armature are of the same length, even when the brushes are set at the quarter, or 90 deg. apart. Since the mechanical distance between the brushes, when they are set at the quarter, is in the ratio of three to one, measuring around the bottom of the commutator and around the top of it, many believe that the paths are in the ratio of three to one.

In the accompanying diagram a conventional series-connected, four-pole armature having fifteen coils and fifteen commutator bars is shown. The two brushes are shown on the quarter, the usual position. The current, entering at the positive brush and leaving at the negative one,

Digitized by Google

Winder



This diagram of a series-connected, four-pole, armature shows that the two electrical paths are equal, even though the brushes are set at the quarter

divides between two paths which are in parallel. One path, as traced in the illustration by arrowheads, includes bars, 2, 9, 1, 8, 15, 7, 14 and 6; the alternate path, not traced, includes bars 2, 10, 3, 11, 4, 12, 5, 13 and 6.

Both paths cross back and forth on the commutator, so that each path includes two quarters of the commutator. The two quarters, however, are diametrically opposite each other, as indicated in the diagram by the double-headed arrows outside of the bars.

Precautions for Testing With Lamp Circuits

TESTING armatures with a lamp testing circuit is a simple procedure but wrong results may be obtained unknown to the tester, if he is unaware of the possibilities of error. There are several precautions, therefore, that he must observe to avoid these errors.

To illustrate how incorrect results can be obtained, consider an armature resting upon an iron truck, which in turn is resting upon an iron floor. It is very likely that any iron floor, such as the floor of an electric oven, would be grounded to the track rail. With a circuit established through the truck and floor, the lamp circuit test would consist simply in touching test point T, indicated in Fig. 1, to the commutator. A ground between the copper and iron would permit the test current to reach the earth by way of the truck and floor and the test lamp would be fully lighted.

If, however, there should be insulating varnish on the floor or in the truck bearings that support the armature shaft the testing circuit would be interrupted and would indicate that the armature was free of ground faults, even though a fault might exist. To make certain that the shaft of each armature is grounded, the test point should be set to the shaft before attaching it to the commutator.

To minimize the possibility of an error of this kind, sometimes two test lines are provided, as indicated in Fig. 2. The line including the test lamp is connected to the trolley and the other line is connected to a positive ground. The use of two lines, however, introduces another possibility of error. If the workman reverses the leads and touches the line from the trolley to the armature shaft, assuming the trucks to be grounded the lamp will glow and a grounded fault will be indicated although none may exist. The precaution to be taken here is to touch both test points, one after the other, to the armature shaft. If the lamps do not

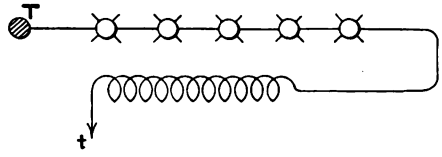


Fig. 1—Method of connecting single test circuit

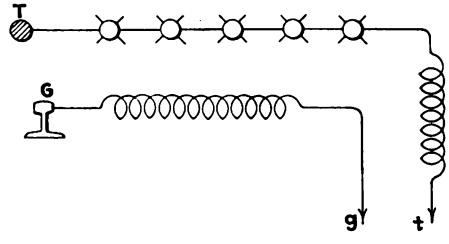

Fig. 2—Connections for two test circuits

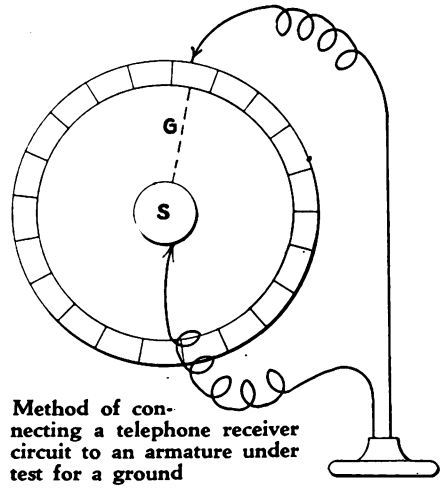
light in either case the truck is not grounded. If they are lighted by one test line and not by the other, the one that lights the lamp should be touched to the commutator when making the test for a ground.

Telephone Receiver Test for Locating Grounds

DEAD GROUNDS in four-pole, series-connected armatures can be located approximately by using a telephone receiver test circuit. Although the bar or coil in which the ground is located cannot be determined by this method, the approximate location can be found and the lamp test circuit used to determine the exact location. This method frequently saves much time over testing each individual path of the armature.

In conducting a test, a current of



Method of connecting a telephone receiver circuit to an armature under test for a ground

three or four amp. is sent through the armature by connecting the supply circuit at points 90 deg. apart on the commutator. One end of the receiver circuit is then connected to the armature shaft, indicated as S in the accompanying illustration. Tapping the other end of the circuit on a commutator bar produces a click in the receiver.

Assuming that a ground exists in the armature, the intensity of the click as the contact is moved from bar to bar varies from a loud hammering noise to a barely audible click. The maximum intensity of the click occurs at the farthest point from the ground, while the minimum click occurs at the bar nearest the ground. It is necessary, therefore, to find the bar which produces the least audible click.

With the ground located approximately, the top leads of two diametrically opposite bars in the vicinity of the ground may be raised, and a lamp test circuit used for determining whether or not the ground is in that particular isolated unit. When the faulty unit, composed of a bar and coil, is found, the bottom lead of the unit may be disconnected and the exact location determined.

Water Under High Pressure Substituted for Sandblast

EXCELLENT results in cleaning car trucks brought in for overhaul have been obtained by the Market Street Railway, San Francisco, Cal., by the substitution of washing for sandblasting. The outfit consists of a hot-water heater and high-pressure pump. Six pounds of cleaning compound are added to 100 gal. of water, which is heated to 135 deg. and brought by the pump to a pressure of 300 lb. It has been found that the time required to do the work has been reduced by one-third, in addition to which the job is better and the shop is kept cleaner. Small parts of car equipment are cleaned in a large tank in which water is heated by steam to about 180 deg. The sandblast is still used for cleaning rough castings, controller parts and armature cores.

Welding Rod Captures Broken Axle Piece

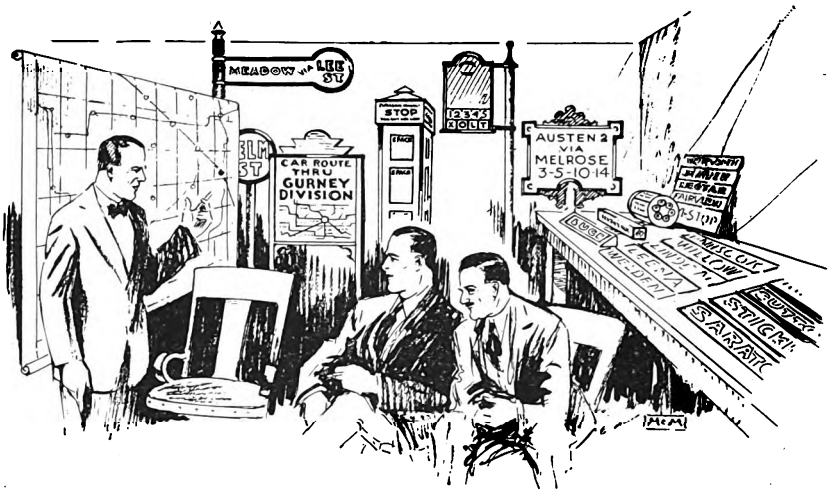
WHEN the axle of one of the gasoline-electric motor buses of the International Bus Company, a subsidiary of the International Railway, broke in two in Buffalo not long ago the hardness of the metal at the point of the break was so great that the usual methods of drilling the short section of the shaft as a means of withdrawing it could not be used.

Current furnished by the electric generator of a gasoline-electric motor bus was sufficient to affix a welding rod securely to end of broken axle

The situation was solved ingeniously, however, by grounding one lead of the electric generator to the bus frame and fastening the other lead to a 2-ft. piece of $\frac{3}{8}$-in. welding rod. With the bus motor driving the generator the welding rod was touched to the end of the broken axle section and are welded to the shaft. The leverage afforded by the rod then made it a simple matter to withdraw the short piece of elusive shaft.

Dick Prescott Reports an Experience

and Learns the Reason



WHEN Dick Prescott, superintendent of equipment of the Consolidated Railway & Light Company, and his assistant, Steve White, called at the office of the Grand City Railway, they were received by Mr. Robins, the general manager. Their experience with the street car service in this city had been a pleasant surprise, and since the purpose of their inspection trip was to pick up new ideas for application on their own property, Dick was intent upon finding the causes behind the unusually courteous and accommodating car operator in charge of the car on which they had traveled from the station to the hotel.

As the two visitors entered Mr. Robins' office they could not avoid a hasty glance around the room before explaining the purpose of their visit. It was the strangest looking railway manager's office they had ever seen and resembled a display room in a sign manufacturing plant. On stands, brackets, walls and tables were signs of many varieties and colors.

"Well, gentlemen, I can see that you are impressed by our little sign shop," said Mr. Robins with a smile, voicing the thought in the minds of our two friends.

"This certainly looks very interesting," replied Dick. "We are naturally wondering what it's all about."

"That's very simple to explain; we're trying to make it easy for the public to use our service."

"We were impressed by that fact on our arrival this morning," again replied Dick with enthusiasm. "Those maps you have in your cars are an immense help to a stranger; and the operator we rode with to the hotel was as efficient and accommodating as any street car man I ever met."

"Have any trouble finding out how to reach the hotel by street car?"

"Not a bit."

"Ask anybody how to get there?"

"No, there were signs at the station and on the cars that gave us the information."

"All right, gentlemen, that's what we're trying to do all over this system, and that explains this little sign exhibit that attracted your attention when you came in. All we're trying to do here is to answer questions before they are asked."

"That sounds interesting in its possibilities," remarked Dick. "Does that mean that you try to tell a passenger by signs how to find his way about on your property, so that he doesn't need to ask questions regarding what cars or routes to use in getting to his destination?"

"You've hit it right on the head. We assume that not only strangers in the city, but many of the permanent residents here do not know their way around town on our cars. We constantly try to put ourselves in the position of a prospective car rider, and we try to imagine all the questions that would arise in his mind in making a trip from one point to any other point in town on our system. Then we try to answer those questions by maps, signs, route numbers and stop indicators. We try to tell him where to find the route he should use in reaching his destination."

"Doesn't that run into a lot of money for signs and their maintenance?" queried Dick.

"Yes, that's true, but we consider this the best possible kind of advertising, for in every one of these signs mounted on poles, at street corners and at strategic locations, besides those mounted in the cars themselves, there is a silent invitation to prospective passengers to use our service."

"That certainly sounds convincing," remarked Dick.

"Come over to this map," replied Mr. Robins, "and I'll explain our idea in more detail."

Association Activities

Detecting High-Accident Men*

By Dr. C. S. Slocombe
Safety Adviser Boston Elevated Railway

ONE advantage in safety work in street railway companies possibly does not obtain so much in industrial plants, namely that every accident, no matter how small or whatever its nature, must be reported; even if it is only that a car scrapes paint off an automobile fender or an automobile scrapes paint off a street car. The more accident reports there are, the more chance there is of accurately finding out causes by statistical analysis and treatment.

The first thing noticed when the situation on the Boston Elevated Railway was investigated was that a certain number of men seemed to have many more accidents than others, even though operating over the same routes and under approximately identical conditions. It seemed that those men with a large number of accidents needed to be dealt with first.

Any occupation may be regarded as hazardous or non-hazardous according to the average number of accidents that occur in it. But whether it is hazardous or not, accidents may be due to two different circumstances. Either there is a small number of employees who have a large number of the accidents and thus boost the average, or the accidents may be spread pretty evenly, none seeming to have many more than the others.

In the second instance the conditions of work would be regarded as particularly hazardous. Safety work then should be devoted to improving the lighting or ventilation, putting up guards, organizing committees, etc.—generally using means which will affect the whole group more or less the same way. Both of these conditions may occur together, as they seem to in the street railway business. That is to say, there are a large number of accidents due first to the large number of automobiles, narrow, crowded streets and operating conditions affecting all men, and second, the large number is due to a small number of high-accident men.

It is quite possible to find out statistically without any detailed examination of records whether there is present in any group of workers a proportion who are accident-prone. The only two figures that need be known are (1) the per cent who had no accidents during a period and (2) the average number of accidents per employee. Curves based on the work of English statisticians are then used for the purpose of telling whether there are accident-prone men in a group.

Assuming that these conditions exist, that is, that there are high-accident men and others with a general medium average, the employees can be split into two groups: 75 per cent having a comparatively low number each, say averaging three, and 25 per cent having a high number of accidents each, say averaging eight. The percentages might, of course, be 80 and 20 or 67 and 33, according to where the dividing line is put.

In what way are we to deal with accidents? Which group is to be dealt with first? You may knock off one accident from each man in the 75 per cent and get a reduction of 75 accidents, or you can knock off three accidents from each of the 25 per cent and get the same reduction.

In Boston, work was started on the

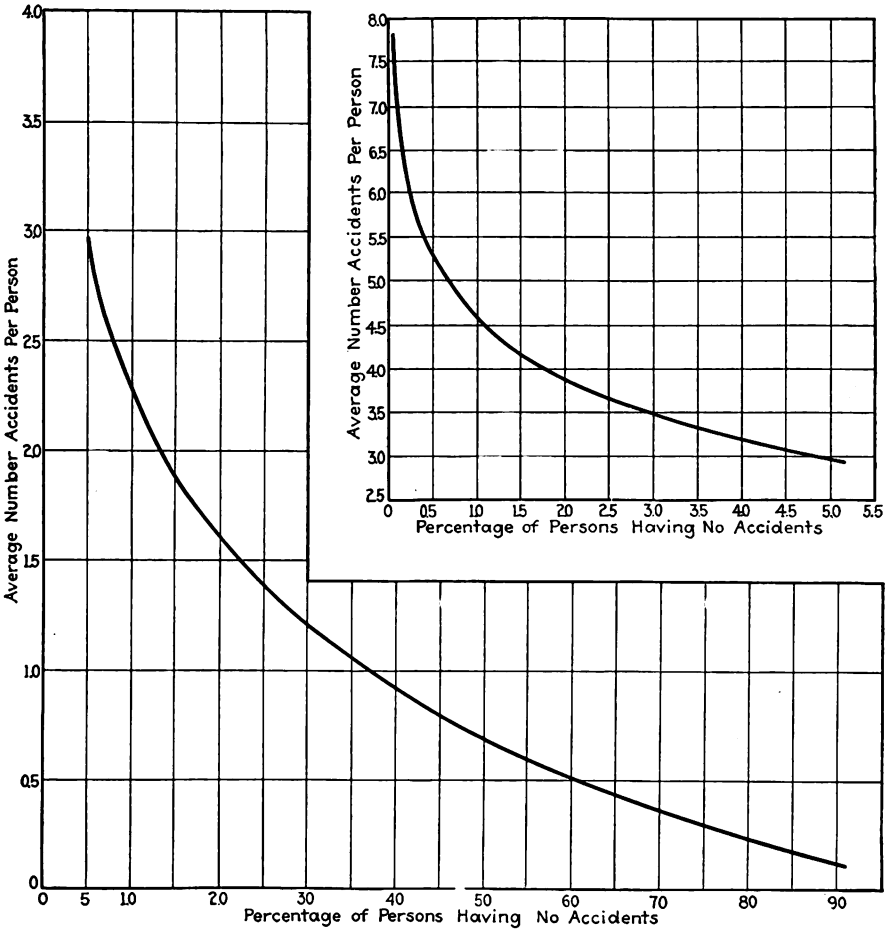

Chart used to determine whether a group contains men who are particularly susceptible to accidents

The chart at the upper right shows on a larger scale the upper end of the chart at the left. Owing to the steepness of the curve, when the percentage of persons having no accidents is less than 5 per cent, the readings can be obtained more accurately on the right-hand chart. To use this chart: (1) Find out how many motormen had no accidents in the period studied; (2) then read from this curve what the average number of accidents per man should be if there are no accident-prone men; (3) then divide the total number of accidents by the total number of motormen; (4) if (3) is greater than (2) it shows the presence of accident-prone men. The greater the difference the worse they are and the more there are of them.

These charts are drawn from tables published in the report of the Industrial Fatigue Research Board 34, of London, As they are based on the theory of probability, they are applicable to any industrial plant or department of a plant, and for any period, say one month, three months, or a year.

Of a large number of operators in Boston, it was found 4.6 per cent had no accidents during 1927. From the chart it should be expected then that the average number of accidents per man would be 3.1. Actually, it was found to be 5.45. This showed that a number of men required special treatment, and the next step was to find these men. If the actual average had been 3.1, the probabilities were that all men were equally careful and accidents might be reduced by stimulating all to increased care.

*Abstract of paper presented at the annual conference of the Massachusetts Safety Council, Boston, Mass., April 30, 1928.

Digitized by Google

small group of high-accident men for three reasons: (1) They seemed to be doing the best they could to avoid accidents and were fully as careful as the others. There was a general feeling that their accidents—and consequently all accidents—were due to bad luck. (2) It seemed that the use of any general methods applying to all the men—such as safety committees, rivalries between carhouses, bonus plans, etc., could not affect the high-accident men. (3) The effect of the work on the 25 per cent is likely to spread to the 75 per cent.

It was decided to treat certain men who had five accidents or more for the twelve months previous. The number could have been put at four or more, but it was a matter of how many could be dealt with in a reasonable length of time. The decision also depended to a certain extent on the statistical distribution. Previously there had been a tendency to deal with the men who had two or more accidents in one month, and no attempt made to try to find out from a man's accidents over a long period why he was having them. Little can be found out from one or two accidents about a man's actions, but from a number one can find what type of accident he is likely to have and what causes him to have accidents at all. Keeping records or even studying them, of course, isn't accident reduction. But records are essential in showing the men who are most likely to have accidents and in helping to prevent them from having more.

This is most important, particularly in view of the English finding, which is confirmed in Boston, that the man who has minor accidents is the man who tends to have major accidents. The English also found—this is likewise confirmed—that the man who has many accidents one year will generally have many in any other year. Quite often such a man runs along for an extended period, having a number of minor accidents which lead up to an accident costing the company $25,000 or more, its cause being exactly the same as that of the small accidents.

The methods in dealing with the high-accident men will not be detailed here. Each man has to be treated as an individual and dealt with differently. There were 181 men and they were treated 181 different ways.

Work was started on them in November and every man was tackled by Dec. 31. Their accidents started coming down in December and have kept down. Last year these men averaged 7.5 accidents each, making a total of 418 accidents during the first four months of the year. Up to the end of April in this year (one-third of a year) they had averaged 1.1 each or 3.3 per man per year, and the total number of accidents they had was 205. When the statistical curve was applied to the group it was found that 90 per cent of the high-accident men had been cured and were down among the average of the whole group. From the first of May they were no longer treated as a special group, but safety efforts were spread over all the operators, different methods being used, of course, in an attempt to obtain a general reduction. However, a statistical curve will be used each month all the time to check up on the high-accident group to see whether the practice of discontinuing treating them specially has caused them to slip back.

Organization and Value of Safety Committees*

By J. H. Handlon
Claim Agent, Market Street Railway, San Francisco, Cal.

UNTIL recently it was the practice of street railway companies, in their accident prevention work, to establish but one safety committee. This was known as a central or general safety committee. Serving on that committee was but one representative from each department, division, carhouse, repair shop, power station and office of that company. Changes were made in the personnel of this committee, monthly, quarterly, semi-annually or annually, or upon the resignation or death of a member of the committee.

In theory, this was an ideal arrangement, giving a full representation on the committee of all branches of the service. It was also thought that by inviting committeemen to monthly dinner meetings at the expense of the company there would be created a spirit of co-operation and fraternalism that would result beneficially. Many companies, impressed with that plan, adopted it.

When the task was undertaken of forming new committees to replace the old, it was found difficult to locate employees who were well qualified to serve as committeemen. Men who had other good qualities lacked the ability to obtain the hearty co-operation of fellow employees in safety work. Others were not sufficiently observant to detect weaknesses or defects that should have been readily discernable. There were still others who, while enthusiastic at the start, allowed their interest in accident prevention to abate, as time progressed.

It was also discovered that a committee composed of but one representative from each department was handicapped in attempting to consider intelligently ideas submitted to them, because each committeeman, while familiar with the workings of his own department, was not informed of the work of the other company departments. Therefore, he could not always visualize the conditions that prevailed in departments foreign to his own.

Under modern methods, general safety committees are composed of heads of all departments. The chairman of such a committee is usually the claim agent, safety engineer, or safety director of the company, although often that official merely acts in an advisory capacity.

Reporting to the general or central safety committee are the departmental safety committees, whose meetings are usually presided over by the assistant to the head of the department, general foreman or similar officer. These departmental committees have the advantage of being able to thresh out among themselves all safety ideas or safety suggestions that particularly involve the department in which they are employed. They are composed of division superintendents, inspectors, instructors, follow-up men, foremen, etc.

All committees meet monthly. The meetings of the departmental committees precede the meetings of the general safety committee, so that the latter committee, at its monthly meeting, has confronting it the reports of the various subordinate committees and their recom-

mendations. The departmental committees also review at their meetings the minutes of the previous meeting of the general safety committee.

On some properties, the general safety committee makes a tour of inspection the day of the meeting, but this is not always feasible.

The general safety committee is usually authorized by the management to place in effect all approved safety suggestions, provided the expense does not exceed a fixed sum, and the departmental safety committees are permitted to adopt any safety idea, the cost of which is nominal, or where the changes are minor in character, subject, however, to the approval of the head of the department.

All accidents occurring during the previous month that resulted in injury to employees within the department are reviewed by the departmental safety committee. All public accidents of an unusual nature, or which might have been prevented by the company or its employees, are likewise discussed by the general safety committee and measures for preventing a repetition of such an occurrence are either placed in effect or recommended to the management for adoption.

Proposed changes in traffic laws are advanced and reviewed, and support is given by the committee to those changes which they consider advantageous from a safety standpoint.

New safety devices are investigated and experimented with, and the experience of other street railway companies in the use of such devices is ascertained.

The committee is kept informed in a general way of what new methods are placed in effect by other street railway companies in their work of accident prevention, and serious accidents that occur on other properties, which come to the attention of the committee, are commented upon and steps are taken, if necessary, to prevent such accidents from happening.

The education of employees in first aid work is promoted through the general safety committee.

A continual watch is kept for new street hazards that arise from time to time as traffic is diverted or unusual conditions that present themselves on the thoroughfares traversed by the company's cars, and through this committee the aid of the police department is enlisted.

Safety Suggestions Solicited

Safety suggestions are earnestly solicited from all employees, and the public is encouraged to offer suggestions in accident prevention by being kept informed in a general way of the work the company is doing in that direction and of the willingness of the company to adopt any reasonable precautionary measures.

For the convenience of employees, some companies install suggestion boxes. Other companies invite their employees to submit their suggestions direct to the departmental safety committees or to the division superintendent, foreman, etc., either verbally or in writing.

Members of departmental safety committees and employees whose suggestions for safety have been put in effect are sometimes rewarded by the company for their efforts by being presented with badges, watch fobs, or similar tokens, indicative of the company's appreciation.

All persons making safety suggestions are informed of the action taken with their suggestion, so that if it is not approved they are made aware of the fact that the suggestion has received the fullest consideration and the reason for not adopting the suggestion is revealed to them.

On the properties of the Market Street Railway, San Francisco, employees are not restricted to making safety suggestions. All suggestions which are of a constructive and practical character and which consist of ideas, methods, practices or improvements not now in effect, are not only welcome but employees are urged to make such suggestions. If adopted, the suggestor is suitably rewarded with a cash prize. This policy has created a vast amount of interest among the men in the subject of safety, as well as a spirit of co-operation that is today one of the principal assets of that company.

Many unique yet practical ideas which were presented have been put into effect on these properties with splendid results, and they are still being received daily.

American Association News

Annual Convention Luncheon Conferences

PERSONAL invitations are being sent out by President Stevens to company members of the American Electric Railway Association, asking them to participate in the group luncheon conferences to be held at the hotels in Cleveland on Monday, Tuesday, Wednesday and Thursday, Sept. 24-27, during the annual convention of the association.

Attendance has been limited to 50 at each luncheon, because of the desirability of informal discussion. Tickets will be sold in advance at association headquarters. The luncheons will start promptly at 1 p.m., and the discussion will follow immediately thereafter, lasting until 2:30, so that there will be no interference with the afternoon sessions.

The following subjects will be discussed:

Monday—Safety, fares, taxation, manufactures.

Tuesday—Interurbans, traffic, education, merchandising.

Wednesday—Financing, public relations, new cars, small city transportation problems.

Thursday—Freight, management, motor bus.

Bulletins in Preparation

SPECIAL reports on several subjects are in preparation by the bureau of information and service of the American Electric Railway Association. They will be available to member companies on request. Following is the list:

Bulletin 212: Motor Bus Franchises—This contains complete copies of 27 street bus franchises granted to electric railways or their subsidiary bus companies and nine so-called car bus franchises (including two car-trolley bus franchises) providing for the joint operation of street railways and buses. Included in the bulletin is also a detailed analytical index permitting ready reference to any subject covered by the various franchises.

Bulletin 213: Motor Bus Operating Reports—This contains copies of the annual reports of a number of independent motor bus companies and summaries of the reports of large groups of companies to the state public service commissions, together with miscellaneous financing data on motor bus operations compiled from various sources.

Bulletin 214: Comparison of Electric Railway Operating Conditions, Operating Expenses, and Results of Operations on Various Unit Bases—1927. Part III Combination city and interurban lines—A tabulation of ratios and unit figures derived from the operating reports of combination city and interurban companies permitting an accurate comparison of their fundamental operating conditions and the results of their operations. Included in the data tabulated are average speed; number of passengers per mile of track, per car-mile and per car operated; operating ratio; gross and net revenue per mile of track; cost of maintaining plant and equipment per car-mile and per unit of property maintained; and operating costs on various unit bases of comparison.

Bulletin 215: Independent Motor Bus Lines—This is a tentative list of independent companies operating motor bus lines and has been limited to the companies operating ten or more buses or having a capitalization of more than $100,000. In each case there is given the name of the company and address, number of buses operated, location of routes and other available data descriptive of the operations.

The following supplements also have been prepared, bringing the information they cover down to date:

Supplement 10 to bulletins 163 and 164: Electric Railway Fares.

Supplement 5 to bulletin 188: Wages of Trainmen.

Supplement 5 to bulletin 189: Wages of Bus Men.

Bulletin 216: Cost of Living Studies.

News of the Industry

St. Louis Appeals Fare and Valuation Issues

An appeal has been made by the City of St. Louis, Mo., to the Circuit Court of Cole County against the decision of the Missouri Public Service Commission granting the St. Louis Public Service Company an 8-cent fare and a rate-base valuation of $65,500,000. It also contends the 7.14 per cent return allowed the company on the $65,500,000 valuation is excessive.

The chief reliance of the city in its suit is that the valuation allowed is virtually that which the commission found would be the cost of reproducing the property. That the valuation should not exceed $53,000,000 and that the return should be limited to 7 per cent on that valuation are the views of the city. Eight cents is charged on all the bus lines operated by the company as part of its general system. Buses and cars interchange transfers without extra cost to the rider.

Extension of Time in Shreveport

Louisiana Commission is now studying application of company for 10-cent cash fare

ATTORNEYS for the Shreveport Railways, Shreveport, La., have requested the United States Court to grant a further extension until Sept. 17 to give the Public Service Commission ample time to consider the fare application of the company now under consideration by the Public Service Commission.

The fare issue affecting Shreveport dates back to Feb. 25, 1928, when the company applied to the Louisiana Public Service Commission for a 10-cent cash fare with a weekly permit to ride for 5 cents, three tickets for 25 cents and 4 cents for school children. At that time the company prepared statements showing the value of the property, taking an inventory and appraisal made by F. A. Jones of Dallas in 1922 and J. F. Coleman of New Orleans in 1923, brought up to date by additions and deductions, and a statement of earnings and expenses showing that the net earnings based on book value were only 2.83 per cent for the year 1927.

When on June 16 the commission failed to take any action upon the application, the company applied to the United States District Court for the eastern district at New Orleans for an injunction restraining the Louisiana commission from interfering with the collection of the rate. This application was set for hearing at New Orleans on July 9 at which time the chairman of the Louisiana Public Service Commission appeared and explained why the commission had not acted upon the application. The court continued the case until Aug. 6 in order that the commission might act. The commission set July 26 for hearing at Shreveport. After this hearing had proceeded it was adjourned until Aug. 6 by the chairman, who was called to New Orleans. Meanwhile he instructed the company to get additional explanatory statements which were prepared and furnished at the Aug. 6 hearing after the first adjournment.

The Mayor and commissioners of Shreveport intervened in opposition to the request for an increase and employed Colbert & Snider, a firm of public accountants, to check the accounts. Their findings substantiated the company's statements. The chairman of the commission expressed doubt as to the benefits that would accrue to the company by the adjustment of fare, complaining that when the rates were made too high the public would seek other means of transportation.

Changing Aspects of Transportation

Boston system furnishes striking example. Car riding for pleasure is still to be cultivated

AN ARTICLE, illustrated with graphs, in a recent number of *Co-Operation,* published by the Boston Elevated Railway, Boston, Mass., reflects the effect of the auto on the number and character of passengers carried on that system and quotes figures which as the Boston *Herald* sees them "will astonish those who have been reading about expansion programs entailing an outlay of $25,000,000 or $50,000,000."

Back in 1915, the "L" carried about 352,500,000 passengers, and last year the total was only 366,900,000, an increase of 14,400,000, or about 4 per cent in twelve years. More surprising still, back in 1917 the total was 381,000,000, or about 14,100,000 more than in 1927. That is, the traffic in 1917 was as much greater than in 1927 as the traffic of 1927 was greater than that of 1915. Of particular interest is the change in the kind of passengers. *Co-Operation* says:

Pleasure riding has practically disappeared and business riding has apparently increased. The automobile has taken passengers away on Saturday and Sunday and in the summer months. The summer vacation has become prevalent in practically all industries.

Experts of the company cite figures showing that, Saturday and Sunday riding excluded, the "L" averaged about 1,074,000 passengers weekly in 1917; 1,087,000 weekly in 1926, and 1,079,000 in 1927. On Sundays in 1917, the average was 728,800; in 1926 it was 576,700, and in 1927 it was 555,300. The Sunday decrease between 1917 and 1927 was therefore about 173,500. The weekday traffic of August, 1927, was less than that of August, 1917; the weekday traffic of January, 1927 was slightly greater than in 1917. The number of holiday passengers was smaller by almost 200,000 in 1927 than in 1917. The company thus concludes:

The railway service is becoming more and more a business service. Its main and primary function is taking people to work in the morning and home at night. There has been an accentuation of the peak hour of the day.

As the *Herald* interprets these facts the automobile has been the main influence in these changes, no doubt, and other agencies also are at work. The 10-cent fare has probably had some effect. The disappearance of cars from the surface in various places has been another factor. Many old lines have been discontinued and the end has not come yet. Old tracks are coming up and few new ones are going down. There was a time when it was said that more street cars passed Milk and Washington Streets than any other corner in the United States. No cars at all pass that corner today. Again, the short haul has not bulked nearly so big in recent years. The *Herald* concludes:

It is not safe to assume, however, that car riding for pleasure has gone definitely. The elevated, we notice, is advertising in newspapers, by billboards and on the cars themselves, the pleasure spots which are within easy reach of the city by trolley. At the same time the builders are themselves doing considerable to win back the pleasure-riding passengers by improving both the outside appearance and the inner comfort of cars. While the drift from the street cars to the automobile was at its height railway men seemed to the layman to be a little bit dazed by the tendency. But now they seem to have got their second wind. Strangely enough, the railroads are also making efforts to induce the people to use the trains more often. The steam road stresses the dovetailing of the automobile and the train. Governor Fuller, it has been pointed out, uses his automobile to go to the North Station, takes the Boston & Maine to Rye Beach and there proceeds by another automobile to his house. Similarly it is not at all unusual for persons who work in Boston and live some distance away, to drive in to a point where they can board a street car.

Higher Fares Filed by Queens Road

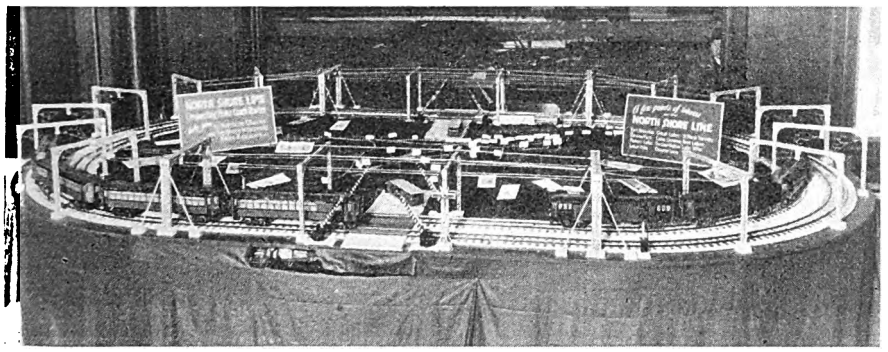
Seven cent fare schedules, effective Sept. 10, have been filed with the Transit Commission by the receivers of the Steinway Railways, comprising a group of surface lines in Queens.

The Steinway Railways group includes the Dutch Kills, Jackson Avenue, Steinway, Ravenswood, Flushing Avenue and Broadway lines in Queens. A 5-cent fare is now in force on all these routes. The group of surface lines originally included in the New York & Queens County system, became a separate unit several years ago.

It's All There for the Observer

A miniature replica of a modern electric interurban railway is being used effectively for exhibition purposes by the Chicago, North Shore & Milwaukee Railroad as a graphic illustration of North Shore Line service. The model is built on the scale of one-half inch to the foot, and faithfully reproduces the entire North Shore Line system, including both rail lines and auxiliary Marigold motor coach routes, with cards designating all important points served.

The exhibit was recently displayed in the window of the Outing and Recreation Bureau at 72 W. Adams Street, Chicago, a public information service maintained by the North Shore Line and associated public utility companies serving the Chicago metropolitan area. According to John J. Moran, commercial manager of the North Shore Line, it is planned to use the model at various fairs and other public gatherings in the territory served by the railroad.



Ingenious device to show North Shore service

Survey Reported in Houston

Mayor Holcombe, of Houston, Tex., has taken up the matter of a survey to be made of the entire street railway situation in that city and is reported to have consulted with J. A. Beeler, traction expert, New York, looking toward retaining of experts for a transportation study in the interests of the city.

This action follows the proposition made by Jeff Alexander, manager of the company, at a hearing before the City Council, to sell the railway system of the Houston Electric Company to the city. The hearing was for the purpose of considering the removal of the car tracks from one of the principal streets, and the substitution of bus service. At that time, Mr. Alexander said that the city must buy the company, subsidize it, or the matter would end in the courts, for it was impossible for any private corporation to continue to give something that cost more to operate than it received for the service.

Change in Name of St. Louis Loan Association

The name of the building and loan association of the employees of the St. Louis Public Service Company, St. Louis, Mo., has been changed from the United Railways Savings & Loan Association to the Public Service Savings & Loan Association. Organized in 1915 the association has been successful in promoting thrift and home-owning among the employees. It now has assets of $4,800,000 and is authorized to sell stock with a paid-up value of $12,000,000, compared with $1,000,000 when it was organized. The company has handled $18,000,000 of its members' money, and in 26 consecutive semi-annual dividends at the rate of 6 per cent per annum, has paid $1,187,000 in dividends to the savers.

details of equipment and operation.

The two-track right-of-way is ballasted with fine gravel. Overhead is catenary construction, with minature steel towers and copper trolley wires. Around the circular tracks run two four-car trains. One is a miniature duplicate of an all-steel passenger train, composed of two passenger coaches, a diner, and a parlor-observation car. The other is a merchandise dispatch train, including three cars used for handling regular less-than-carload freight shipments and one electric refrigerator car for handling perishables. All the cars are painted in the new North Shore Line colors of orange with maroon trimmings. The interiors of the passenger cars are illuminated by tiny electric bulbs.

There are two crossings, protected by the new type of electric automatic safety gates recently installed at several points on the North Shore Line. These gates are operated by completion of a track circuit by approaching trains and function without human assistance. For the passing motorist who disregards the warning lights and bells and strikes the gates, they swing horizontally and later return to their upright position without being damaged by the impact, thus insuring maximum crossing protection at all times. Automatic block signals also alternately flash green and red as the trains circle the tracks.

The Marigold motor coaches of the metropolitan system, which are operated extensively throughout North Shore territory in cross-country service as feeders to the rail lines, are stationed near the tracks. In the center of the oval formed by the tracks, laid out in colored rubber hose, is a bas-relief of

To Operate Between Ballston Spa and Saratoga Springs

There was no opposition at a hearing held Aug. 9 before the Public Service Commission on the petition of the Schenectady Railway for approval of contracts affecting it, the Hudson Valley Railway and the Delaware & Hudson Company, by which its cars may continue to operate in and between Ballston Spa and Saratoga Springs, N. Y. The Schenectady Railway proposes to lease two of the Delaware & Hudson Company tracks which it has used for several years past, .09 mile of track in Ballston Spa, from the Hudson Valley Company, and to use jointly the Hudson Valley Terminal in the city of Saratoga Springs. Attorneys for the Schenectady Railway stated that if this request is granted it would enable the Schenectady company to have through traffic from Albany to Saratoga Springs.

Increased Speed for Kansas City Cars Sought at Hearing

A recommendation that the speed of street cars be increased to 15 m.p.h. in the business district of Kansas City, Mo., and 25 m.p.h. in the residential section was made by the Council as the committee of the whole at a hearing on the revised and compiled general ordinances into one document. The present speed limit is 12 m.p.h. in the business district, and 20 in the residential district. Officials of the Kansas City Public Service Company asked for an increase at the hearing so the street cars could move with the flow of motor traffic.

Fare Hearing in New York Postponed

First of the public hearings on the 7-cent fare schedules filed recently by the Eighth and Ninth Avenues Railway has been postponed by the Transit Commission until Sept. 7. Formal objection by the city of New York, to the granting of the 7-cent fare was filed by Corporation Counsel Nicholson of the Transit Commission on Aug. 6. Mr. Nicholson contended that the Transit Commission had no jurisdiction or power to grant the requested increase.

New Service for Chicago Travelers

The Chicago, North Shore & Milwaukee Railroad announces the completion of arrangements to sell Pullman tickets to all points throughout the country served by interconnecting steam lines operating out of Chicago. Purchasers travel by the North Shore Line to Chicago, where they transfer to the train on which their Pullman reservation has been made. The interurban is the first transportation system not under contract with the Pullman company to be granted this sales privilege.

R. S. Amis, general passenger agent, said that the addition of Pullman reservations to interline rail ticket sales service gave the North Shore Line a complete hook-up with other mediums of transportation.

Full Publicity but Not Propaganda

The *Security Owner*, organ of the National Association of Owners of Railroad and Public Utility Securities, declares that since newspaper comments on the Federal Trade Commission's utility inquiry have been almost exclusively devoted to one phase of the investigation, the impression has been erroneously created that the publicity practices of utilities are vicious. As this commentator sees it, inasmuch as the utilities furnish indispensable services which the industries of the country must have in ever-increasing quantities, it is important that a continuous knowledge of the facts concerning their management and operation should be furnished the public. This can be attained only through a proper use of publicity. The *Security Owner* says in part:

The utilities have been active in disseminating information so as to give the public a more intimate knowledge of public utility problems. This is a perfectly legitimate and even commendable practice to which no odium should attach. Indeed informative publicity is in the public interest in that it enables the public more clearly to understand the importance of public utility questions which constantly and vitally affect their daily lives.

An informed and intelligent opinion is essential to the welfare of utilities, which not only have a right frankly to explain their problems to the public but would be derelict in public duty if they did not do so. They must protect their stockholders and customers from the effects of unwarranted attacks based on misinformation and must voice an effective protest against unwise action by governmental officials. In other words they must appeal their case to public opinion and in order to do so information must be disseminated. This is not a corrupt practice or even misconduct but the exercise of a lawful right. No convincing reason has ever been urged against it.

For the most part publicity by utilities has been legitimate and by proper methods, but it appears that certain overzealous agents of the utilities have carried their campaigns too far. Publicity of this character must be distinguished from legitimate publicity, which has for its purpose the disclosing of factual data and accurate and dependable information. The industry should continue its splendid work in disseminating accurate information so as to insure public understanding but it should cease once and for all any attempt at propaganda which is not essential.

Subway Progress in New York

Appropriations made for $20,000,000 construction projects. Hearings scheduled for other work. Summary of Board's work

A PUBLIC hearing will be held on Aug. 31 by the Board of Transportation of New York to decide on the forms of contract to be issued for the construction of the city subway on Northern Boulevard from 36th Street to Broadway, Queens, and along Steinway Street from Northern Boulevard to 53rd Place, Long Island City. The boroughs of Brooklyn and Queens have almost as many miles of subway under construction as Manhattan. The entire new system will include 57 miles of track, and will cost in the vicinity of $700,000,000, of which nearly $70,000,000 is already under contract in Brooklyn and Queens. According to present plans the whole system will be finished some time in 1931.

On Aug. 16 an appropriation of $20,000,000 was authorized to the Board of Transportation by the New York City Board of Estimate to complete subway construction. The largest item was $10,000,000 to pay condemnation awards on property in Church Street already acquired for the Eighth Avenue subway. Other items included $5,295,000 for the construction of the Smith Street section of the Culver line subway in Brooklyn, and $3,400,000 for the extension of the Fourteenth Street-Eastern line from Sixth to Eighth Avenues, Manhattan.

Contracts have been awarded by the Board of Transportation of New York City in the last four years for rapid transit facilities totaling $261,049,854. Of this sum, Chairman Delaney points out in a summary of the board's achievements, $215,750,162 was for 22 miles of the city's new independent system, extending the length of Manhattan Island and under the Harlem River to the Bronx and across 53d Street to Long Island City as well as to downtown Brooklyn by way of Fulton Street and a new East River tube.

Under contracts No. 3 and No. 4 with the I.R.T. and the New York Rapid Transit Corporation, Chairman Delaney's summary says, $45,000,000 worth of contracts have been awarded for construction, most of the expenditure going into the 3½ miles of the Fourteenth Street-Eastern subway, the Nassau Street subway, Coney Island yards, the Flushing Extension from Corona, extension of the Queensboro subway to Times Square, platform extensions in 40 B.-M.T. stations and various yard construction jobs, transfer facilities, station entrance relocations and other enterprises.

During the past four years, Chairman Delaney announced, the following payments have been made by the city on vouchers certified by the Board of Transportation:

City's new system	$129,471,798
B.-M. T. system	32,954,653
I. R. T. system	14,027,036
Miscellaneous	631,020
Total	$177,084,510

This total represents about 38 per cent of the city's rapid transit construction cost of $457,728,680 in the past 28 years.

Chairman Delaney's summary shows that the board has awarded, in the six months ending June 30, 1928, contracts amounting to $28,991,054, divided as follows:

City's new system	$27,937,100
B. M. T. system	945,669
I. R. T. system	108,284
Total	$28,991,054

The addition to these figures of $5,255,751 in contracts not yet awarded brings the six months' total to $34,246,805.

The summary refers to the letting of the contract for additional transfer facilities at Union Square between the Fourteenth Street-Eastern and Broadway-Fourth Avenue lines of the B.-M.T., which are expected to afford material relief for congestion at Canal Street.

The Board of Transportation was created by act of the Legislature four years ago to enable New York City to design, construct and operate its own rapid transit system as well as to construct additions and extensions.

Rerouting in Columbus to Be Considered

The City Council of Columbus, Ohio, has set Sept. 10 for a public hearing on rerouting four street car lines operated by the Columbus Railway, Power & Light Company. The proposal arose out of the council's recent action in placing the Main-Neil cars back on High Street requested by business groups.

Wage Issue in London, Ont.

Demands from employees of the London Street Railway, London, Canada, for an increase in their wage of 7, 12 and 15 cents an hour and a reduction in hours have been refused by the management. The men are now applying for a conciliation board under the industrial disputes act. The London Street Railway is operating on a 5-cent fare and claims it is unable to pay any increase in wages, or satisfy the men's demands.

Hail and Farewell in Augusta

The Aug. 9 *News Letter* published by the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., is intended as an introduction to the Southeastern Power & Light Company, recent purchasers of the property. It carries the picture and a brief sketch of nearly all department heads, and also a few lines regarding some of the oldest employees. In this way new owners can become familiar "with the faces, records, capacities and other qualifications . . . ." The passing of the Augusta system into Southeastern hands was referred to in ELECTRIC RAILWAY JOURNAL, issue of Aug. 11, 1928. Under "Farewell and Greetings" a laudatory comment is made on the passing of the J. G. White Management Corporation and a welcome is tendered to the new associates.

Bridge Talk in Omaha Does Not Affect Submission of Ordinance

So far as the City Council of Omaha, Neb., is concerned there will be no amendment to the franchise ordinance for the Omaha & Council Bluffs Street Railway. Disregarding the demand of United States Senator Howell that the sale to the city at the original cost of the bridge across the Missouri River be made a part of the transaction, that body has ordered the question submitted to the voters at the November election exactly as drawn up in the final negotiations with President Shannahan. The bridge sale agitation has taken a new form, that of the filing of a petition for a voters' referendum on a proposal to issue $800,000 as the county's share of a free bridge across the river. This would have to be followed by a city bond issue, and when carried the authorities would be in a position to negotiate for the purchase of the company's bridge.

Treadle Exit Explained to Patrons

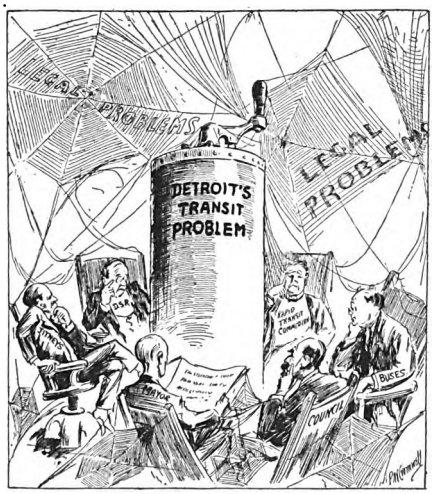
A four-page folder is being distributed by the East St. Louis Railway, East St. Louis, Ill., on the various city divisions having the automatic rear treadle exit doors. The folder called "Facts of Interest About This Safety Car," explains to patrons the convenience offered by the rear treadle and is illustrated by several pictures showing its use and operation. In introducing the treadle the company states that this is its first appearance in East St. Louis.

Aurora Line Announces Transfer Privileges in Chicago

The Chicago, Aurora & Elgin Railroad has announced that its patrons can transfer, free of charge, to any elevated train operating in the city of Chicago. At Marshfield Avenue, at Canal Street (Union Depot), or at the Wells Street Terminal the change may be made. Chicago, Aurora & Elgin trains enter Chicago and leave it over the tracks of the Garfield Park branch of the Chicago Rapid Transit Company.

Caution Suggested in Dealing With Detroit Commission

Members of the City Council of Detroit, Mich., favor doing away with the services of some or all persons connected with the rapid transit commission. Four Councilmen believe the people should have a chance to vote on the amendment eliminating the commission. Four others take the position that present defects in the Detroit Municipal Railway system could be remedied by reducing the allowance for the commission's operation. At a recent meeting of the Council William P. Bradley, asking that nothing be done until John C. Nagel, acting Mayor, is back in the Council, said:



—Detroit *Times*

Need of a superman pictured in Detroit

> Whenever a large building is erected or a large sewer installed, though, the transit commission studies the situation to see that nothing done will interfere with the building of subways. The commission has done most important work since it was founded in 1922, and its results far outweigh the $335,000 it has required to date or the $1,000 additional it costs each week. The commissioners are working tirelessly for the city's interests. I believe subways or elevated railways are bound to come as the city grows, and I would consider it a serious mistake to discharge the commissioners. One engineer and possibly an assistant or two should be enough of a staff for the present, however, in my opinion.

The commission consists of Col. Sidney D. Waldon, Col. H. W. Alden, Clarence W. Hubbel, Andrew H. Green, Jr., and Willard Pope. The commissioners serve without pay, the expenditure of $50,000 a year going mainly to the commission's employees. In 1923 it outlined a subway system on which nothing was done because of the tremendous cost. In 1926 it proposed its $28,000,000 "start" on a subway system, but this too was shelved. Since then the commission has made no new offer.

Fare Applications Before Virginia Commission

The petitions of the Lynchburg Traction & Light Company and Roanoke Railway & Electric Company for fare increases have been heard before the Virginia Corporation Commission, with most of the evidence dealing with the value of the company's traction properties. Increases have been suspended until Sept. 1. The cases are now under advisement. Both companies claim they are operating at a loss.

L. M. Zapp, Chicago engineer, who recently made a survey of the Lynchburg properties, has been on the stand. He was questioned on the value of the traction equipment and on the basis on which current expense figures were drawn. City Attorney T. G. Hobbs, of Lynchburg, questioned Mr. Zapp closely upon his evidence.

A financial statement covering the affairs of the Roanoke Railway & Electric Company for the past four years has been presented to the Roanoke City Council as an explanation of the necessity for increased revenue. The statement was in the form of a letter from C. B. Short, manager of the railway, and the Safety Motor Transit Corporation, recently consolidated. Coordinated service is proposed by the two companies under the plan for increased fares and revision of bus routes. One item in this statement is as follows: Net income or deficit, 1924—$8,513; 1925—$2,759; 1926—$44,365 (deficit); 1927—$79,114 (deficit).

Both companies have asked that the fares be raised from 5 to 7 cents, with four tokens for a quarter and unlimited transferable weekly pass for $1.

Justice Asked for Indiana Interurbans

A stand in support of interurban electric railways of Indiana in competition with buses and automobiles was taken recently in an order written by John W. McCardle, commissioner of the Indiana Public Service Commission, and approved by the commission in which a petition for extension of bus service of the Hoosier Transportation Company was denied. An investigation by David Matthews, railroad inspector for the commission, included in the order, showed the facilities offered by the Terre Haute, Indianapolis & Eastern Traction Company's line, which parallels the proposed route, were adequate. In his order, Mr. McCardle wrote that to operate a bus line not actually necessary, paralleling and in competition with an interurban railway was unsound, uneconomical and unfair, where extra taxes would have to be shifted to farmers and small home owners. He pointed out the difficulties under which electric lines have been operated, due largely to increased use of the automobile, and said that taxing officials, recognizing this handicap, have reduced the taxes on such utilities.

Recent Bus Developments

Nineteen Miles of Bus Route in Connecticut Approved

Permission has been given the New Haven & Shore Line Railway by the Connecticut Utilities Commission to abandon approximately 19 miles between Guilford and Saybrook, and to substitute buses. Trolley operation between New Haven and Guilford is still retained.

This substitution has been brought about very largely by the fact that the company has many bridges on this particular part of its line and the repair and renewals, as well as the maintenance and rebuilding of track and overhead, which have been deferred to a large extent, would prove too burdensome Moreover, the railway parallels the greater part of this route with bus operation so it was considered advisable to go to bus operation entirely.

The Groton & Stonington Traction Company, which is managed by C. O. Weidman, general manager of the New Haven & Shore Line Railway, was changed over from trolley to bus on July 29 last. This was due to heavy expenditures which would have to be met within the next year, brought about by highway improvements in which the company was heavily involved and also to heavy operation costs due to the use of old-fashioned car equipment.

Quicker and Shorter Service Into St. Louis

The recent completion of the two new Lewis and Clark Bridges over the Missouri and Mississippi Rivers pave the way for the Alton Railway to operate the new St. Louis-Alton motor coach route in connection with the Bellefontaine lines, giving Alton patrons a shorter and quicker route into St. Louis. Recently, the Alton Railway took over the operation of the Bellefontaine Bus Company, operators of bus lines from Baden, North Broadway, in St. Louis to Riverview Gardens, Spanish Lake, Chain of Rocks and Parkview Amusement Park. Purchase of the bus line by the Alton Railway includes the necessary certificates of convenience to operate buses on three routes. The district they serve is partly residential with numerous truck farms scattered in between small villages. S. A. Parnell, who organized the Bellefontaine Bus Company, has been retained by the Alton Railway as supervisor.

A New Love Proves False in Washington

IT NOW seems certain that the Independent Taxicab Association of the District of Columbia definitely has abandoned its intention of resuming its rush-hour jitney service, despite the representations of the drivers that they had merely suspended the service in order to make further studies. The opinion that the jitneys will appear no more is shared by officials of the Public Utilities Commission and others cognizant with Washington's transit situation.

The Independent Taxicab Association, which is composed of 160 taxi men each one of whom owns his own cab, tried the experiment of operating a jitney service during the morning rush hour. As there is little demand for taxicabs at this time of day, it was thought that it would prove profitable to fill the cabs with office workers and carry them to fixed points in the business center for 10 cents a head. The third morning of this service turned out to be very rainy. A sudden demand for taxicabs was created with the result that the drivers could not resist the temptation of going after the more profitable business. They accordingly hauled in their destination signs and left their newly-won patrons waiting on the street corners.

This sudden desertion of the public resulted in such a protest on the part of civic bodies that the Independent Taxicab Association decided to discontinue the jitney service. The officers of the association found that they could not compel the drivers to stick to their routes, since each cab is independently owned and operated.

At the same time, the District of Columbia Public Utilities Commission was not entirely powerless to deal with the situation. By taking advantage of a court decision which ruled that taxicabs operating between fixed points were common carriers, the utility authorities were confident that they could bring the jitney drivers to terms. It is admitted, however, that it would severely tax the facilities of the commission to have to impose regulations separately on each of the 160 drivers as common carriers.

It is therefore thought that matters would be greatly simplified if the commission could be given authority to regulate taxicabs. In accordance with this thought, legislation is now being drafted with the expectation of bringing it up before Congress during the next session.

Co-operation with Railway in White Plains

The Soundview Transportation Company, Inc., was given a certificate by the Public Service Commission on Aug. 10 for the operation of buses in White Plains on Old Mamaroneck Road from Soundview Avenue to the city line at Scarsdale. This route will be operated as an extension of the present system. The Commission held that convenience will be afforded residents of the Ridgeway Station section where the buses will operate in co-operation with the New York, Westchester & Boston Railway.

Marshalltown Turns to Bus

Bus service has supplanted the electric railway system of the Iowa Railway & Light Corporation, in Marshalltown, Iowa. In place of the seven electric cars the new schedule requires six buses. A bigger territory is covered by the bus, and for the first three weeks the buses were in service operation showed a gain in revenue over the previous three weeks' operation of the street cars. Marshalltown has a population of approximately 16,500.

Extension of Service Authorized in Virginia

The Safety Motor Transit Corporation, owned by the Roanoke Railway & Electric Company, has been granted permission by the State Corporation Commission to operate passenger buses half a mile beyond the corporation limits of Vinton. A petition seeking the permit was laid before the commission several weeks ago. This extension in service is in line with similar changes proposed for the city.

Would Discontinue Shuttle Line in Utica Another Year

The New York State Railways applied to the Public Service Commission on Aug. 3 for approval of the continued discontinuance of operation of its Auburn Avenue shuttle line in Utica until July 1, 1929. Operation was temporarily discontinued on Jan. 14, 1925. The petition states that the Co-ordinated Bus Lines is providing transportation service in that part of the city.

Transfer Charge Requested in Washington

An application for authority to charge 2 cents for transfers issued between cars and buses at Fifteenth and H Streets northeast has been filed with the Public Utilities Commission by the Washington Railway & Electric Company, Washington, D. C.

Free transfers have been issued between the buses and the cars ever since bus service was substituted for rail serv-

Digitized by Google

ice on Bladensburg Road more than five years ago. This arrangement, the commission decided at the time, should exist for a five-year trial period, after which it would consider whether a change should be made.

Last month President Ham of the railway explained that during the five-year trial period the company had lost $44,511 and that relief was necessary.

Proposed Line Abandoned

The California Railroad Commission has dismissed the application of the Los Angeles Railway Corporation for a certificate to operate bus service connecting the Washington Street car line with the city limits at Culver City. Because of the abandonment of the proposed stage line by the Pickwick Stages between Los Angeles and Venice, the company has abandoned the proposed bus line.

Pittsburgh to Wheeling

Through bus and rail service between Pittsburgh, Pa., and Wheeling, W. Va., was started on July 25 when combination tickets were placed on sale by the Pittsburgh Railways and the Washington Transportation Company. Passengers are carried over the interurban lines of the railway between Pittsburgh and Washington, Pa., and by bus between Wheeling and Washington. Through fare is $1.45—70 cents on the railway and 75 cents on the bus.

Change in Cincinnati Terminal

Interurban bus operators have chosen the old Y.W.C.A. building and adjacent property on Eighth Street between Vine and Walnut Streets, Cincinnati, for an interurban bus terminal, E. D. Gilman, Cincinnati public utilities director, announced on Aug. 10. The interurbans have been using Government Square as a terminal, but Director Gilman instituted action to oust them by Sept. 1. New plans call for service lanes on the west side of the Y.W.C.A. building, which structure will be used for waiting rooms, concessions, ticket offices and the like.

Buses Replace Cars on New Rochelle Line

Authorization was given the Westchester Street Transportation Company, successor to the Westchester Electric Railroad, by the city of New Rochelle, N. Y., Aug. 15 to replace its East Main Street cars with buses. The railway is allowed to charge a 10-cent fare on the buses. Recently an attempt to induce the City Council to reconsider the proposal of the Third Avenue Railway to substitute buses over this route under conditions requested by the railway failed when the Councilmen refused to put the suggestion for reconsideration into the form of a motion.

Financial and Corporate

One-Year B.-M.T. Notes to Be Sold

At a special meeting of the board of directors of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., held on Aug. 13, the board authorized the sale to the Chase Securities Corporation, Hayden, Stone & Company, and J. & W. Seligman & Company of $10,000,000 one year 6 per cent notes to be dated Aug. 1, 1928, and to be secured by $12,000,000 principal amount of New York Rapid Transit Corporation's refunding mortgage 6 per cent sinking fund gold bonds—series B. These are a part of $17,000,000 of such bonds authorized some time ago by the Transit Commission to be issued by the New York Rapid Transit Corporation on account of extensive purchases of new cars and other capital betterments and to be sold to the Brooklyn-Manhattan Transit Corporation.

Since the Transit Commission authorized the issue of these bonds the Brooklyn-Manhattan Transit Corporation has purchased $14,000,000 in principal amount thereof in order to provide the New York Rapid Transit Corporation with funds for new cars and other capital betterments under contract No. 4. The statement of G. M. Dahl, chairman of the board, said that the sale of the one-year notes by the Brooklyn-Manhattan Transit Corporation was for the purpose of replenishing its treasury in part for funds used in purchasing these bonds.

Service Improvements in Mexico Increase Earnings

Gross earnings of the Mexico Tramways, Mexico City, for 1927, amounting to $11,010,865 (Mexican Currency), compared with $9,931,280 for 1926, show an increase of $1,079,585. A net operating profit of $885,659 is shown, after making deductions for tax payments and depreciation, an increase of $807,155 over the previous year. These facts were disclosed in the annual report of the president, G. R. G. Conway, for the year ended Dec. 31, 1927. An improvement in the earnings received from operation are attributable to service changes and to the increase of twenty new cars.

STATISTICS OF MEXICO TRAMWAYS

	1926	1927
Average earnings per passenger car per day	$63.86	$70.94
Average receipts per passenger car-mile	0.5117	0.5409
Operating expenses, excluding taxes and depreciation, per car-mile, passenger services	0.4758	0.4610
Operating expenses, including taxes and depreciation, per car-mile, passenger services	0.5237	0.5065
Daily average earnings from operation	27,208.99	30,166.76
Daily average operating expenses, excluding taxes and depreciation	24,439.88	25,164.50
Daily average operating expenses, including taxes and depreciation	26,993.91	27,740.29
Percentage of gross expenditures, excluding taxes and depreciation, to gross earnings	89.82	83.42
Percentage of gross expenditures, including taxes and depreciation, to gross earnings	99.21	91.96

Car Earnings

	1926 (Mexican Currency)	1927 (Mexican Currency)

Freight and sundry	625,375	576,282
Omnibuses	.....	.....
Total	18,568,009	19,741,800
Average number of passenger cars operated per day		
Electric	389	396
Gasoline and mule cars	4	4
Omnibuses	...	...
Total	393	400

The total number of passengers carried under the new system between April 1 and Dec. 31, 1927 was 91,533,210, compared with 66,245,201 for the corresponding nine months of the year 1926, and the gross earnings showed an increase of about $1,000,000 (Mexico) over 1926 during a similar period.

The amount of $1,463,285 (Mexican currency) was expended during the year for repairs and maintenance of equipment, and $850,192 was spent on track, overhead lines and buildings. These two items represent a combined expenditure of $2,313,477 out of a total maintenance cost of $2,354,611. A decrease of $59,199 is shown in these expenditures compared with the previous year.

Operating expenses, at $6,830,430, increased $323,682. Taxes paid were $340,164, an increase of $7,945 over 1926. The total increase in expenses amounted to $272,429.

The accompanying table shows the gross earnings, operating expenses, and miscellaneous information for the years 1926 and 1927:

During the year $1,083,473 (Mexican currency) was spent upon new completed and uncompleted construction

Digitized by Google

work, and upon reconstruction work properly chargeable to capital account; property and equipment retired represented a value of $378,188 (Mexican Currency) making a net addition to the capital account and its subsidiaries of $705,284 (Mexican Currency.)

During the year an order for twenty new steel cars was placed with the J. G. Brill Company, Philadelphia. These cars are of the 600 series, with centre exit, similar to the 30 cars placed in service in 1924, which have proved to be very popular with the public. These cars were received and placed in service during the months of September and October. Six passenger cars, and several trail and freight cars, were retired as being unfit for further service.

Jitney competition continued to be severe, but the jitney lines, in many cases, found it necessary to reduce fares and issue special rate tickets in order to compete with the street railways.

Track mileage in 1927 covered 208.4 miles.

Chicago Reports June Traffic

There was an increase of 1,512,003 in total rides on the Chicago Surface Lines during June compared with June, 1927, but there was a decrease of 477,570 in the number of revenue passengers. The 133,095,478 rides, including transfers, not only exceeded the number in June, 1927, but were 115,177 more than in June, 1926, when the Eucharistic Congress was held in Chicago. Revenue passengers for the month numbered 72,957,212, compared with 73,434,782 in June, 1927.

Gigantic Utility Consolidation in New York Approved

Approval by the New York Public Service Commission of a billion-dollar consolidation of the Brooklyn Edison with the Consolidated Gas Company of New York has brought virtually all the light, power and gas companies in the Greater New York district under Consolidated Gas ownership. Although the Governor had requested that individuals or organizations be given an opportunity to be heard for or against the petition, the Public Service Commission refused to re-open the hearings, thereby sanctioning the deal whereby the Brooklyn Edison Company becomes a component part of the Consolidated Gas Company through exchange of stock on a basis agreed upon. It is definitely stipulated in the commission's statement that capital expenditures of the Consolidated Gas Company in acquiring stock of the Brooklyn Edison must be limited to the book value of the latter, or approximately $137 a share instead of the market value of $250 a share. No railway properties are involved.

Both George B. Cortelyou, president of the Consolidated Gas Company, and Matthew S. Sloan, president of the Brooklyn Edison Company, expressed the belief that real benefits would accrue from the merger.

Loss on Gloversville Road

In the annual report of the Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y., for the year ended Dec. 31, 1927, J. Ledlie Hees, president, said that the net income would have been $44,435 if deductions of $43,074 had not been previously made for depreciation charges and "Amortization of Discount on Bonded Debt." Corporate surplus on Dec. 31, 1927, was $399,201 and depreciation reserves $750,746. Capital expenditures for the year were confined to paving and street improvements in cities, required by statute, and to the improvements of existing property. There were charged to investment, road and equipment expenditures for additions and betterments the sum of $15,759.

In 1927 the company carried 3,768,726 passengers on its electric division over 18,843,630 miles at a revenue of $608,648 compared with 4,484,506 passengers in 1926 over 22,422,530 miles at a revenue of $642,141.

INCOME ACCOUNT OF THE FONDA, JOHNSTOWN AND GLOVERSVILLE RAILROAD

Railway Operating Revenues	1927	1926
Freight revenue	$449,616	$472,804
Passenger revenue, steam division	23,958	29,851
Passenger revenue, electric division	608,648	642,141
Mail revenue	5,513	5,147
Express revenue	41,762	44,836
All other revenues from transportation	7,548	7,275
Revenue from other railway operations	13,880	14,977
Total operating revenues	$1,150,927	$1,217,034
Railway Operating Expenses		
Maintenance of way and structures	$159,151	$182,074
Maintenance of equipment	127,815	136,165
Traffic expenses	1,343	7,931
Power	66,740	65,841
Transportation expenses	351,808	350,364
General expenses	69,944	73,482
Total operating expenses	$782,803	$815,859
Net revenue from railway operations	$368,123	$401,175
Railway tax accruals	77,012	73,627
Railway operating income	$291,111	$327,547
Miscellaneous operations (Sacandaga, N. Y., summer resort)—income	9,146	16,653
Operating income	$300,258	$344,201
Non-operating income	87,006	72,121
Gross income	$387,264	$416,322
Deductions from gross income other than interest charges	61,402	65,112
Balance (available for interest charges)	$325,861	$351,210
Interest charges	324,500	319,799
Net income (available for dividends)	$1,361	$31,411
Total dividends for year (preferred stock)	30,000	30,000
Balance to profit and loss	*$28,638	$1,411

*Deficit—1927

Permission Sought to Abandon Massillon Service

After approximately 30 years of operating in Massillon, Ohio, the Northern Ohio Power & Light Company has filed application with the City Council to abandon its entire city service. Following repeated loses on its Massillon lines it now feels it can no longer continue such rail losses.

The ordinance, which has had its first reading, provides that the company shall be relieved from operation on North Mill from the company's freight house to Cherry Street; Cherry from Mill to Akron Street; Akron from Cherry to north corporation line; West Main from Erie to west corporation line; Wooster from West Main to west corporation line. The company agrees to re-lay the pavement where rails are removed so that the streets where rails are shall be as good as the balance of the street. Provision is also made for the removal of the suburban line between Massillon and East Greenville.

The last car line to be abandoned was the one between Canton and North Canton. These tracks have been removed from the highway. This action was taken for the reason that the company felt it could not shoulder the paving burden. At the same time passenger service was discontinued between Canton and Akron. Bus operation succeeds the rail abandonment.

Sale of Buffalo Interurban Meets with Protest

Opposition has developed to the sale of the right-of-way of the Erie County Traction Company, an interurban line operating out of Buffalo, to Erie County for $125,000. Senator Hickey sponsored the bill passed by the state legislature and signed by Governor Smith, authorizing the Erie County Board of Supervisors to purchase the property. The county will not buy the rails, ties, rolling stock or other equipment. The towns of Hamburg, Orchard Park, Ebenezer and Gardenville say nothing would be gained by the purchase of the railway's right-of-way which originally was acquired by the railway for $68,500. U. L. Upson, who built the line 28 years ago, also is opposing the sale, saying the scrapping of the line would affect business and property owners along the route.

The opposition to the sale will test the constitutionality of the act in the courts. Protest meetings are being held in all communities affected by the pro-

Digitized by Google

posed scrapping of the line. Bondholders of the road, represented by New York interests, have joined in the opposition. Richard Persons, president of the East Aurora Bank, is president of the Erie County Traction Company.

Suspension on Buffalo Line Approved

The International Railway, Buffalo, N. Y., surrendered its franchise for the operation on cars in Kenmore Avenue, a distance of about 1,300 ft., and has removed its tracks from the street so there will be no more competition between the Kenmore trolley line and the Delaware Avenue bus line which also serves the village of Kenmore, a residential suburb just north of the Buffalo city line. The company has built a new loop at the end of the Kenmore line at the Buffalo city line. By abandoning this part of the route, the company will reduce its running time on the Kenmore line by almost ten minutes.

The Public Service Commission approved on Aug. 6 this declaration of abandonment on Kenmore Avenue.

Preliminary Dealings on California Cable Acquisition

Negotiations for the proposed acquisition of the California Street Cable Railroad by the city of San Francisco were started recently at a conference between members of the Board of Supervisors and President James W. Harris of the cable lines. At the conclusion it was agreed to co-operate with officials of the company in speeding up valuation proceedings.

Recently the finance and public utilities committee of the Board of Supervisors approved an ordinance paving the way for the acquisition by the city of the Market Street Railway and the California Street Cable Railroad and their eventual consolidation with the Municipal Railway.

Would Abandon Line in Johnstown

The Fonda, Johnstown & Gloversville Railroad and the Johnstown, Gloversville & Kingsboro Horse Railroad, the latter company's railroad being leased to the first-named company, have applied to the Public Service Commission for permission to approve abandonment of part of its route in the city of Johnstown, N. Y. Both companies have adopted resolutions calling for such abandonment. The companies state in their petition that business on this line has been decreasing yearly and that the company's franchise to operate upon West Main Street, west of Market Street and upon William Street has no value. A public hearing will be held by the commission.

Encouraging Report on Toledo's Unified System

Results of the first month of operation of the Community Traction Company, Toledo, Ohio, under the new transit ordinance which virtually gave the company a monopoly of bus and street railway business in Toledo "were encouraging in every respect" according to the report of Commissioner E. L. Graumlich to the street railway board of control, at their meeting Aug. 15. He said the revenues were increased by the elimination of competition and expenses were reduced as a result of the lower power rate, reduced interest charges, and economies resulting from a unified system.

In the 27 days of July that the new plan was effective the total revenue for the company was $261,538, compared with $225,604 for a similar period last year. There remained a surplus of $12,135 after all provisions of the Milner ordinance had been cared for. In a similar month last year there was a deficit of $46,296. Due to elimination of the Dorr-Palmwood bus line and better industrial conditions street car business showed an increase. There were 2,928,511 revenue passengers carried in July this year compared with 2,915,651 in July, 1927. Total coach revenue was $39,677, compared with $17,435 for a similar period last year.

The last month's operation under the old plan with four additional days showed $14,852 surplus to the stabilizing fund. There were 3,949,664 revenue passengers carried in this period.

The Community Traction Company became on July 5, the sole operator of the public transportation under a new transit ordinance under which the company is granted a virtual monopoly of the railway bus business for at least five years. The measure provides for rehabilitation of the system and the carrying out of a general city improvement program involving a number of new paving projects. Mayor William T. Jackson was presented with a check for $267,769 representing a paving claim against the railway dating from Feb. 1, 1921, with interest from that date at 6 per cent, and another check for $10,000, partially to reimburse the city for expenditures in the making of transit surveys, was presented by J. Frank Johnson, vice-president and general manager of the Community Traction Company, in the presence of company counsel and E. L. Graumlich, street railway commissioner.

About $70,000 was paid by the company to independent bus operators for equipment purchased. Many of the buses were appraised at $1,600 to $2,000 in the negotiations by which several of the lines were purchased.

Although referendum petitions were circulated by friends of the independent bus operators they were not filed with the city and no challenge has been made to the new plan of operation. Purchase of the principal lines practically eliminated what little opposition there was to the new transit plan. While the company has purchased nearly 40 used buses in the negotiations for independent lines only a few will be serviceable and during the remainder of the year probably 50 new buses will be purchased and put into service.

Would Dismiss Indianapolis & Cincinnati Suit

Dismissal of the suit for a receiver for the Indianapolis & Cincinnati Traction Company, owned by the Indianapolis & Southeastern Traction Company, has been sought in a petition filed in Federal Court by Frederick H. Kelly of Mattoon, Ill., who was plaintiff in the original receivership suit. The suit was heard by Judge Baltzell in Federal Court several months ago, but decision was withheld when both parties agreed to attempt a settlement out of court. At that time Charles T. DeHore and L. E. Eastman, financiers, who were bidding for receivership purchase of the traction company, informed the court that they would buy the preferred voting stock of the Indianapolis & Cincinnati Car Trust Equipment Company, which had been created by the traction company to provide it with rolling stock and power station equipment.

Since the hearing, the two men have bought approximately 95 per cent of the A series of the preferred stock of the equipment company and all of the B series of preferred stock at $45 net to the stockholders, according to Donald L. Smith, attorney. Mr. Kelly held 70 shares of the A series, which have been bought by the new owners. His suit for a receiver for the equipment company alleged that the Indianapolis & Cincinnati had failed to pay dividends on the equipment company's $970,504 preferred stock.

Indianapolis Company Appeal Dropped

An appeal by the Indianapolis Street Railway against the unfavorable decision in the Indianapolis & Cincinnati Traction Company receivership proceedings, pending in the circuit court at Rushville, Ind., for the last two years, has been dropped, it was learned from Will H. Latta, attorney for the street railway. The Indianapolis company had filed a claim for track rentals when the receivership was begun. Judge William M. Sparks denied the claim. It was said that more than 400 pages of the appeal transcript had been prepared. The decision to drop the appeal was made when it was learned there were no funds with which to pay the claims. The only act remaining now to close permanently the litigation of the traction company, the filing of the final receiver's report by Will M. Frazee, receiver, probably will take place shortly.

Personal Items

C. R. McMahon Fills New Post in Oakland

C. R. McMahon, who has been serving in the capacity of assistant to W. P. Jackson, superintendent of equipment, has been appointed master mechanic in charge of the mechanical department of the Key System Transit Company, Oakland, Cal., a newly created post. The position of superintendent of equipment has been abolished.

Mr. McMahon went to Oakland in July a year ago. He had formerly served as superintendent of equipment with the Des Moines City Railway, Des Moines, Iowa. His long career in railroading, beginning with the Beaver Valley Traction Company was reviewed in ELECTRIC RAILWAY JOURNAL, issue of July 16, 1927.

G. B. Avery Succeeds C. R. Jackson in Seattle

Clark R. Jackson has resigned as superintendent of public utilities of Seattle, Wash. Formerly state tax commissioner, his appointment as superintendent of public utilities of Seattle in 1923 was made by Mayor E. J. Brown and approved by the City Council.

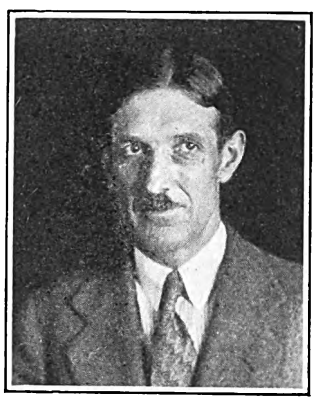
G. B. Avery, recently serving as assistant supervisor of the state Department of Labor and Industries, and formerly a government electrical engineer, was named to succeed Mr. Jackson.

J. W. McCloy Joins *Journal* Staff

J. W. McCloy has joined the staff of ELECTRIC RAILWAY JOURNAL as assistant editor. Mr. McCloy by training and experience is unusually well qualified for work on the JOURNAL for he has wide contact with the industry's problems in several sections of the country, and in addition to actual operating experience has conducted many expert investigations embracing traffic studies, the prospects of the interurban, and the operation of buses in city, suburban and interurban service.

Utility work attracted Mr. McCloy as long ago as 1900 when he was first employed by the Seattle Electric Company, then under the management of Stone & Webster. After several years in the transportation department of the company he was sent to Paducah, Ky., also under Stone & Webster management. Failing in health, he withdrew for a time from the electric railway business and spent the winter of 1908 in El Paso in the service of the government. Returning to Seattle he again entered the employ of the Seattle Electric Company but left the service in 1909 to go with the city of Seattle as car service inspector in the Department of Public Utilities. About this time he first broke into print in the technical press with an article in which he discussed the matter of developing standards of service. As it turned out this was a forerunner of a number of contributions on transportation subjects.

When the United States entered the war and was confronted with the problem of transporting war workers, particularly shipyard men, Mr. McCloy entered the employ of the United States Shipping Board as special agent for transportation, in which capacity he made reports and surveys of car service and general transportation service to shipyards and allied industries at Seattle, Tacoma, Portland and the Grays Harbor cities. War over, and Seattle having purchased its local railways, he went for a time with the Seattle & Rainier Valley Railway under Walter M. Brown. In 1922 he accepted a position with the Indiana, Columbus & Eastern Traction Company at Springfield, Ohio, as traffic engineer. In this capacity he made studies of bus operation throughout the southern Ohio territory. For a time he also handled the company's advertising and publicity work. Leaving the Ohio properties in the summer of 1923 Mr. McCloy went as traffic engineer with a group of electric railway companies under the management of Peck-Shanahan-Cherry, Inc., operated out of Syracuse, N. Y. Here his work involved a survey of the surrounding territory with the view of determining the possibilities for the establishment of motor bus and truck lines to be operated in conjunction with the railways. His work has nearly all been such as makes for that intimate contact with transportation over a wide territory that is necessary to qualify a man to interpret and discuss the problems of the industry. Since this is combined in Mr. McCloy with the ability to express his views clearly and concisely in writing, his addition represents a considerable strengthening of the JOURNAL's staff.



J. W. McCloy

Frank D. Comerford, New Head at Providence

Frank D. Comerford—35 years old, Holy Cross graduate and Harvard Law School specialist in utility law—the new president of the Rhode Island Public Service Company, Providence, R. I., operating among other properties the United Electric Railways, represents one of the largest hydro-electric systems in the United States. Quietly and swiftly the New England Power System, for which properties the New England Power Association is the holding company, has grown from its small beginnings in 1909, yet those beginnings stood for the largest development of their kind east of Niagara. If projects now contemplated go through, the system will have the largest hydro development east of the Mississippi excepting only Niagara.

According to the New York *Times*, the new president is not a wordy man, but what he says counts. An example of this was noted in Worcester, Mass., some time after the Worcester Electric Light Company had gone to court to prevent enforcement of a rate reduction ordered by the Massachusetts Department of Public Utilities. In an address Mr. Comerford significantly extolled the work of the commission. How it "had conscientiously balanced the interests of the consumer and of the investor," its policies were "fair and wise," "in no state had regulation been more intelligent," and anyhow the foundation of industrial success is "goodwill and public confidence."

From the outset New England Power has been aggressive. The policy always has stood for expansion and construction. In 1910 it had 32,000 customers, in 1927 about six times that number. The first year the net earnings were less than $1,000,000, in 1927 about $10,000,000. In 1926 the generating capacity in steam and hydro plants was 476,250 hp., completion of a plant then building lifted the total to 536,250 hp., and the undeveloped sites and recent acquisitions probably place the total well over 700,000.

Gradually has this largest system in New England been built up to supply light and energy for some 9,000 square miles of territory, selling through local distributing companies and covering some 250 communities with a population of more than 2,500,000. It was in 1907 that Malcolm G. Chace and Henry I. Harriman, the latter well known for his city-planning studies and until recently president of the association, began their investigations of possible developments on the Connecticut River in southern Vermont. At Vernon, a few miles below Brattleboro, they built the first plant of the present system, with a capacity of 27,000 hp. Business started in July, 1909, and the power was delivered locally or distributed to Gardner, Fitchburg, Clinton and Worcester. The system's high-tension transmission lines now cover a wide diagonal from Vermont and New Hampshire

Digitized by Google

across Massachusetts and Rhode Island and most of the current is sold in the two last-mentioned states, although business is done in all New England States except Maine.

The corporate offices of the association are in Boston and the managerial offices are now in Worcester; but three floors of the new Batterymarch Building in Boston have been taken for a mobilization of forces. The chairman of the board of directors is Charles L. Edgar, president of the Boston Edison Company, and the chairman of the executive committee is A. R. Graustein, president of the International Paper Company.

Changes in New York Central Force

A. J. Clarkson succeeds J. A. Carmody who joins Eureka Copper Products Company, New York. F. E. Edwards takes over newly created post

A. J. CLARKSON has been appointed superintendent of electrical equipment of the New York Central Railroad, effective Aug. 1, with headquarters in Grand Central Terminal, New York City. In this capacity he succeeds J. A. Carmody, resigned. With the appointment of Mr. Clarkson the position of general inspector, previously held by him, was abolished and F. E. Edwards was appointed assistant superintendent of electrical equipment, also with headquarters in Grand Central Terminal.

Mr. Clarkson entered the service of the electrical engineering department of the New York Central in New York, on July 1, 1916. While in that department he advanced through the positions of draftsman, inspector and assistant engineer, and on April 23, 1923, was promoted to general inspector in the electric equipment department, where he served as assistant to Mr. Carmody, superintendent of electric equipment, recently resigned.

Mr. Clarkson was born in Bloomington, Ill., on Aug. 4, 1893. He received his elementary school education in the public and high schools of Champaign, Ill., after which he completed a course in railway and electrical engineering at the University of Illinois, Urbana, and received the degree of B. Sc. in railway electrical engineering in June, 1916.

In his new position Mr. Clarkson has charge of the maintenance and operation of the electric locomotives and multiple-unit cars which provide the electric passenger and freight service in the electrified territory of the New York Central in and around New York City.

The post which Mr. Clarkson now succeeds to was ably filled for the past five years by J. A. Carmody, whose resignation was recently announced. Mr. Carmody, who knows the railway and railroad electrification business, went to the New York Central in 1906 as general foreman of car equipment. He had worked on car equipment with the General Electric in different parts of the country. Three years later he left the New York Central pursuing appraisal work with J. G. White & Company and working with the Safety Car Heating & Lighting Company on railway train lighting equipment. His return to the New York Central in 1922 was primarily for the purpose of appraising the traction lines of the New York & Harlem Railroad. When a year later a successor to C. H. Quereau, retired on pension, was in prospect for the position of superintendent of electrical equipment Mr. Carmody seemed to be the logical appointee. Under the scheme of organization at that time he reported to the late E. B. Katté.

Mr. Carmody has become affiliated with the Eureka Copper Products Company as district representative with office in the Grand Central Terminal Building, New York City.

The newly-named assistant superintendent, F. E. Edwards, entered the service of the motive power department of the New York Central at the 72nd Street Roundhouse, New York City, as oiler, on Feb. 2, 1905. On April 1, 1906, he left the New York Central under agreement with the company to get some electrical railway experience prior to the inauguration of its electrical operation. This experience was obtained while working for the Interborough Rapid Transit Company in New York City, and on Oct. 2, 1906, Mr. Edwards returned to the electric equipment department of the New York Central as electrical inspector at Wakefield, N. Y. This position he held until Jan. 1, 1908. At that time he was promoted to foreman at Grand Central Terminal and on Aug. 1, 1928, he received the further promotion to the newly created position of assistant superintendent of electric equipment. Mr. Edwards was born in Cairo, N. Y., on Sept. 10, 1888.

T. B. GOODYER has resigned as general manager of Croydon (England) Corporation Tramways after 22 years' service with the city. Previous to this affiliation he was general manager of Croydon Tramways, the private corporation which was taken over by the city in 1906. He will be retained in a consulting capacity.

JAMES R. CLARK of Bloomington, Ill., has been appointed a member of the Illinois Commerce Commission by Governor Len Small. He had been supervisor of the orders of the commission and had also served as assistant commissioner. He succeeds David H. Jackson, Chicago.

BLAKE R. VANLEER, assistant professor of mechanical engineering in the University of California since 1920, has been appointed assistant secretary of the American Engineering Council, succeeding A. C. Oliphant, who has resigned.

Obituary

CHARLES EDWARD EARLEY, purchasing agent of the Louisville Railway, Louisville, Ky., for the past eight years, died Aug. 13 after an illness of two years. At the beginning of the present year Mr. Earley requested that he be transferred to duties less strenuous. Entering the service at Louisville at the age of fifteen as a trolley boy, he worked his way up to the position of purchasing agent in his 35 years with the company.

A. J. ANDERSON, long identified with the Union Traction Company, Nashville, Tenn., died recently. He entered the employ of the company in 1902 as a section hand and served in turn as conductor, motorman, ticket agent, assistant to the general manager, secretary-treasurer and general manager.

William Edwin Freir

The death of William Edwin Freir, founder and editor of the *Electric Railway and Tramway Journal,* London, on May 18, removed a man who had become personally acquainted with many electric railway officials, not only in England but in many parts of Europe and other continents. In connection with electric railway work many firms and companies sought his expert journalistic assistance. For a number of years he made a practice of attending all important conferences at home and abroad dealing with electric traction, and it was while returning from the Rome Conference that he died. Almost his last editorial work was the publication of a special issue of the *Electric Railway and Tramway Journal* in connection with the International Congress at Rome. Apart from technical journalism, he was a most fluent writer on many subjects, in which his natural talents were helped by his wide reading, constant study, and intimate acquaintance with many leaders of thought and opinion.

Mr. Freir was appointed editor of *The Ironmonger* in London in 1877, remaining in charge of that paper for a period of more than twenty years. In 1897 he retired from business, but after a period of a few months he re-entered journalism, founding a group of papers, including *The Automobile and Carriage Builders' Journal, The Electric Railway and Tramway Journal,* and *The Colonizer.* The conduct of these papers will be continued by his sons.

The following appreciation of the man is taken from an editorial in the paper which he founded:

A fluent writer, a keen observer, a great linguist, a much traveled searcher for news his work was recognized everywhere as authoritative and remarkably accurate. He was an assiduous attendant at tramways congresses at home and abroad, and his winning personality and cheery presence will be greatly missed at these gatherings for years to come. The loss caused by his death will be sorely felt by countless friends, but he has left behind memories of inspiration to those who follow him.

Track Market Continues Active

Several Properties Buy Buses and Line Department Materials. Extensive Improvements Planned in El Paso, Seattle and Washington

RECENT purchases of track material and contemplated track jobs continue to be large, according to reports received this week from a number of electric railways. The Washington Railway Electric Company, Washington, D. C., has ordered 250 tons of section 97-420 wheel rail, 70 tons of section 67-34 slot rail, 900 cast-iron track yokes, 1,000 hook bolts 1 x 3 in., 500 hook bolts $\frac{7}{8}$ x 3 in., 2,000 slot bolts $\frac{3}{4}$ x 3 in., 500 21½-in. tie rods, and 700 22-in. tie rods. Twenty-five thousand steel tie plates, 500 steel base plates and 2,500 pairs of channel plates have been ordered by the United Railway & Electric Company of Baltimore.

The Worcester Consolidated Street Railway, Worcester, Mass., has completed the reconstruction of 2,303 ft. of track on Grove Street, and a new turnout has been installed and track reconstructed on Vernon Street. The company has also purchased a type 20 Ingersoll-Rand air compressor, mounted on a Chevrolet truck. This company has filed a petition with the City Council, asking permission to relocate tracks on Chandler Street and to be allowed to construct and maintain conduit in Chandler Street from Main to Wellington Street. The Chicago Rapid Transit Company, Chicago, Ill., is working on its elevated tracks at Evanston, which will give the company elevated tracks for almost the entire length of its north side division.

An order has been placed by the Interborough Rapid Transit Company, New York, N. Y., with the Union Switch & Signal Company for a nineteen-lever electro-pneumatic interlocking machine, for installation at Freeman Street, and also for alternating-current block signaling materials for its White Plains elevated line from 149th Street and Third Avenue to West Farms, consisting of 90 color light signals, 80 electro-pneumatic automatic train stops, 275 relays with necessary switch movements, transformers, instrument cases, and other attendant apparatus. New York Rapid Transit Corporation, New York, N. Y., has ordered material for automatic block signaling on the Williamsburgh Bridge.

As a result of a recent hearing, it is virtually assured that the Seattle Municipal Street Railway, Seattle, Wash., will extend its car line about ½ mile from its present terminus at Beacon Avenue and Spokane Street to Columbian Way. It is estimated that the cost of this extension will be about $46,620, and to carry the extension on to Graham Street, which is being asked for by a number of residents of that district, would cost about $94,000.

Fifteen 33-ft. tubular steel poles, and 50 30-ft. tubular steel poles have been ordered by the United Railway & Electric Company of Baltimore. The Washington Railway & Electric Company, Washington, D. C., has ordered twenty 35-ft. cedar poles, 100 40-ft. cedar poles, and 20 45-ft. cedar poles, 24 30-ft. tubular steel poles and fittings, and 23 28-ft. tubular steel poles and fittings. This company has also ordered 200 porcelain insulators, 50 galvanized hangers, 100 trolley ears, and two section insulators.

The Washington Railway & Electric Company is equipping eighteen cars with door-opening treadles, four cars with manually operated doors, four cars with flexolith floors, and four cars with de luxe leather-covered seats. This company has also ordered 200 22-in. cast-iron car wheels, 50 30-in. steel wheels, and 50 31-in. steel wheels. Seattle Municipal Railways has purchased five new 29-passenger heavy-duty buses at a cost of $38,000. The Community Traction Company, Toledo, Ohio, has ordered three Mack four-cylinder 29-passenger city type buses. The Groton & Stonington Traction Company, Norwich, Conn., has purchased ten Twin Coach parlor cars. The Iowa Southern Utilities Company, Centerville, Iowa, has purchased four Mack four-cylinder 25-passenger city type buses, and the Iowa Railway & Light Corporation, Cedar Rapids, Iowa, has supplanted its car system in Marshalltown, Iowa, with seven Yellow Coaches of the 23-passenger street car type. The New Haven & Shore Line Railway, Guilford, Conn., expects in the very near future to purchase additional coaches for its bus line between Guilford and Saybrook.

The purchase of a bolt-threading machine is contemplated by the Washington Railway & Electric Company. This company has also ordered two 300R remote-control electric-operated gasoline dispensing units. The Twin City Motor Bus Company, St. Paul, Minn., controlled by the Twin City Rapid Transit Company, will enlarge its bus garage at 164 West Fifth Street by adding a second story to cost $15,000. The Boston & Worcester Street Railway, Framingham, Mass., has remodeled its Marlborough carhouse for the repair and storage of buses. The equipment which was formerly there is now in the Framingham carhouse.

Proposed $1,861,003 Rehabilitation for Seattle

In his report advocating a reconstruction program of $1,861,003 on the municipal railway system of Seattle, Wash., acting Superintendent of Railways Roy E. Furse urges that the street car elevated trestle along the waterfront from Spokane Street to Occidental Avenue be abandoned and cars run over to First Avenue South. He recommends the extension of the Spokane Street elevated over to First Avenue South on a structure to cost $43,375 and also rebuilding the present structure on Spokane Street from the waterway east to Marginal Way at a cost of $53,814. Other items include 200 new street cars, paving between tracks on California Avenue and other streets, a new street car line out 35th Avenue Southwest from Avalon Way to the city limits to replace the existing bus line, and a single-track extension up Gatewood Hill on California Avenue from West Myrtle Street to West Monroe Street. In addition, it is proposed to spend $168,815 for a street car line up Admiral Way from Spokane Street to 63 Avenue Southwest.

$400,000 Improvements for El Paso

Improvements to cost $400,000 have been announced by El Paso Electric Company, El Paso, Tex., which includes $250,000 for a new Santa Fe Street bridge and $150,000 for extensions and work in Juarez, Mexico. Car lines will be extended to various parts of city. The bridge is to be of concrete.

Washington Track Improvements

Track improvements involving a total expenditure of $230,682 are being pushed to completion by the Washington Railway & Electric Company, Washington, D. C. This includes the re-laying of 1 mile of track of the conduit type on the Eleventh Street line, six blocks of new track on Connecticut Avenue, and some new special curved track work around Dupont Circle. The company is also making preparations to re-lay a mile of its overhead trolley track on Wisconsin Avenue. An expenditure of $4,000 is being made on Georgia Avenue in removing center trolley poles and substituting side poles.

Cleveland Adopts Girder Rails

After using the T-rail for about fifteen years, the Cleveland Railway, Cleveland, Ohio, has adopted the American Electric Railway Association standard section girder or groove rail.

The change was made on the recommendation of H. H. George, engineer, who came to the Cleveland Railway organization several months ago from the Public Service Railway of New Jersey.

The Cleveland City Council recently authorized the railway to buy 600 tons of girder rails from the Bethlehem Steel Company and 1,500 tons from the Lorain Steel Company.

Ten Cars Being Built for Pacific Electric

Pacific Electric Railway, Los Angeles, Cal., expects delivery by Oct. 15 of its ten two-man, motor, passenger cars ordered from the St. Louis Car Company. These cars are of the double-end, double-truck city type.

The length of each car is 52 ft. 2 in., the width is 9 ft. 1¾ in. and the weight is 57,800 lb. The bodies are of all-steel construction with arch-type roof and center sliding and folding end doors. Twenty-two cross-seats and eight longitudinal seats are provided. The exterior is finished in bandarilla red and the interior trim is mahogany. Each truck is equipped with two motors, 26-in. cast steel wheels and roller journal bearings. Additional information is given in the accompanying specifications.

Builder of car body	St. Louis Car Co., St. Louis, Mo.
Date of order	May 1, 1928
Date of delivery	Oct. 15, 1928
Weights:	
Car body	29,000 lb.
Trucks	15,360 lb.
Equipment	13,440 lb.
Total	57,800 lb.
Bolster centers	29 ft.
Length over all	52 ft. 2 in.
Length over body posts	48 ft. 2 in.
Truck wheelbase	6 ft.
Width over all	9 ft. 1¾ in.
Height, rail to trolley base	10 ft. 11½ in.
Window pos. spacing	30 in.
Body	All steel
Air brakes	Westinghouse type S.M.E.
Axles	4½ in. diameter (4¼x8 in. journals)
Car signal system	Faraday bells and buzzers
Compressors	Westinghouse type DH-16
Conduit	Metal
Control	Westinghouse type HL, 600 volt
Couplers	Westinghouse type K-1-A
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Hunter illuminated and non-illuminated
Door mechanism	Consolidated Car Heating Company
Doors	Sliding center doors, folding end doors
Finish	DuPont
Floor covering	Flexolith
Gears and pinions	Nuttall helical, grade BP
Glass	A.A. double strength
Hand brakes	Miners ideal safety
Heat insulating material	Three-ply Salamander Hairfelt
Heaters	Consolidated Car Heating Company, type 1522-T
Headlights	Crouse Hinds type 2
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Melcher Hyatt roller
Journal boxes	Melcher Hyatt equipped
Lamp fixtures	Safety Car Fixtures E.S.S. Company
Motors	Four Westinghouse No. 532-AR
Painting scheme	Bandarilla
Registers	Ohmer
Roof type	Arch, "Neal" construction
Roof material	16 in. O.H. sheet steel
Safety car devices	Electric Pneumatic door Equipment C.C.H. Co.
Sash fixtures	"Rex" removable brass sash and fittings
Seats	Heywood-Wakefield type 327-M
Seat spacing	30 in.
Seating material	Brown Spanish leather
Slack adjusters	Westinghouse type J
Steps	Folding step at end exit only
Step treads	Feralun
Trolley catchers	"Eclipse" No. 2
Trolley base	Two US-13-E
Trolley wheels	Kalamazoo 5 in. No. 23
Trucks	Commonwealth, four-wheel cast steel
Ventilators	Consolidated Car Heating Company Automatic
Wheels	Griffin, F.S.C.—S.P. diameter 26 in.
Wheelguards	Eclipse type C

Cleveland Terminal Electrification Plans

Passenger trains in and out of Cleveland will be handled by electric locomotives after Jan. 1, 1930. The newly electrified zone is to include about 16 miles of multiple track route, extending from Linndale on the west through the new terminal station to Collinwood on the east. A portion of this electric zone will be on the right-of-way of the New York Central and Big Four lines, and the remainder on the Nickel Plate.

The power distribution will be of 3,000 volts direct current, with catenary overhead construction. The motive power for the initial operation will include twenty 204-ton, geared-type, passenger locomotives.

These locomotives are being built jointly by the American Locomotive and the General Electric companies. Each unit will weigh 204 tons, with 150 tons on the driving axles. The six-geared driving motors will have a total rating of 2,900 hp. at the one-hour rating, and 2,465 hp. at the continuous rating. At each end of the locomotive is a two-axle guiding truck designed to insure successful operation at high speeds. The total length of the locomotive is 80 ft., while the length of the cab is only 52 ft. The running gear includes two 3-axle Commonwealth Steel trucks coupled by an articulated joint and two 2-axle guiding trucks, each carrying a weight of about 27 tons.

The motors are of the usual design for articulated truck type locomotives, being carried at one side on the driving axle and at the other on the transom through a spring nose suspension. Two cushion-type gears are provided for each motor, one at each end of the shaft meshing with a pinion on each end of the motor. The gear ratio is 79 : 29. The control is designated as PCL non-

Battery Men to Meet

Final arrangements are now being made by the program committee of the National Battery Manufacturers Association for the annual convention to be held at the Ambassador Hotel, Atlantic City, N. J., on Thursday and Friday, Sept. 20 and 21.

A comprehensive business program is being planned including many papers of technical and general interest by prominent men in the industry. All persons interested in the battery manufacturing industry are invited to attend this convention.

E. H. Gerberding Assistant Treasurer of Westinghouse

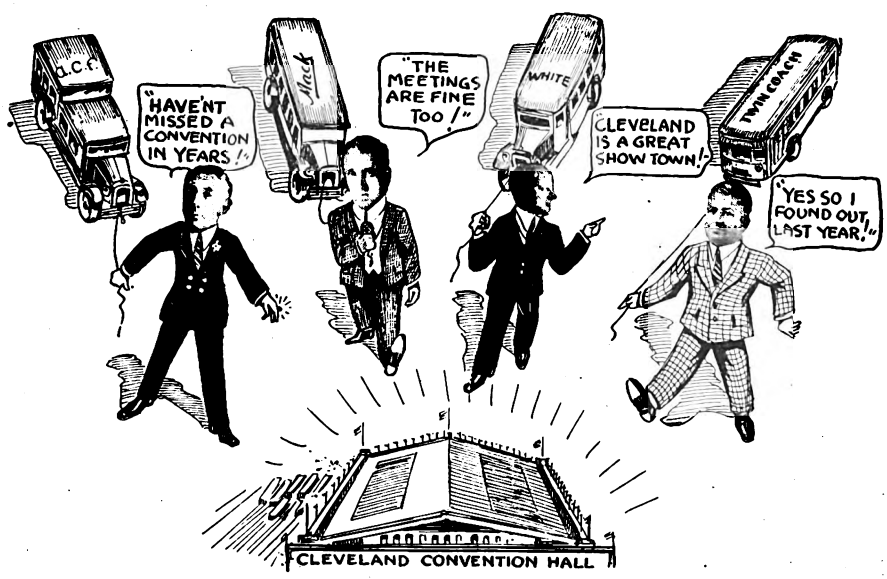
E. H. Gerberding, of Pittsburgh, Pa., has been promoted to the position of assistant treasurer of the Westinghouse Electric & Manufacturing Company. As a seventeen-year-old boy he began work in the company's treasury department 28 years ago, and has been continuously employed in the same department since that time.

American Brown Boveri Buys Packard Transformer

The transformer division of the Packard Electric Company, Warren, Ohio, has been purchased in its entirety by the American Brown Boveri Electric Corporation. The transformers made by the Packard company will be continued in all types and sizes under the established trademark "Packard."

The American Brown Boveri company states that the manufacturing and engineering facilities will be consolidated with those of its other departments at the Camden, N. J., plant. It is understood that N. A. Wolcott, president of the Packard Electric Company, will become affiliated with the American Brown Boveri Company.

Exhibitograph No. 17



The Exhibitograph Spotlight continues to find the exhibit committee voting "greatest" and "best" for this year's convention

Digitized by Google

automatic, and includes provision for the operation of two or more locomotives in multiple unit. The master controller has a main handle, a reverse handle and a field control handle, with suitable interlocking to prevent improper handling. The control provides a total of nine running positions and 33 resistance steps.

The main circuits are protected by a high-speed circuit breaker which opens ahead of the main contactors. Current at 1,500 volts is supplied by a 3,000/1,500 volt dynamotor for driving the blowers and some other auxiliary circuits. Low voltage power for control, lights, etc., is taken from a control generator mounted on an extension of the dynamotor shaft. This generator supplies about 40 volts for charging a sixteen-cell Exide Ironclad storage battery. The auxiliaries include two 1,500-volt motor-driven air compressors and two 1,500-volt motor-driven blowers. Electric heaters and some of the other equipment are also operated from the 1,500-volt supply.

The train heating equipment on each unit will include an oil-burning steam boiler with suitable tank for oil and water, similar to the equipment now being used on the passenger locomotives operated by the New York Central Railroad at New York.

The dimensions, weights and ratings of the locomotive are:

Length inside knuckles	80 ft.
Length over cab	52 ft.
Height over cab roof	13 ft. 2 in.
Height over trolley locked down	14 ft. 10 in.
Rigid wheelbase	15 ft.
Total wheelbase	69 ft.
Total weight	408,000 lb.
Weight on drivers	300,000 lb.
Dead weight per driving axle	11,800 lb.
Weight per guiding axle	27,000 lb.
Horsepower, six motors, continuous rating	2,465
Horsepower, six motors, one-hour rating	2,900
Tractive effort, continuous rating	23,600 lb.
Tractive effort, one-hour rating	29,200 lb.
Speed, continuous rating	39.2 m.p.h.
Speed, one-hour rating	37.3 m.p.h.
Tractive effort at 30 per cent coefficient	90,000 lb.
Maximum speed	70 m.p.h.
Weight of train handled	1,275 tons

Purchases and Stores Convention Exhibit

The Purchases and Stores Division of the American Electric Railway Association will exhibit at the Cleveland Convention in space No. 200 a delineascope, displaying views of stores building, stores layout and material handling devices.

No one realizing the potential savings to be made by the use of up-to-date stores practices can afford to miss visiting this exhibit. For the first time it is possible to assemble and show such views obtainable from 34 utilities, large and small in this country, Canada and Mexico. The use of devices such as escalators, chutes, cranes, magnets and electric lift trucks will be shown.

In addition there are displayed various sets of scenes of central forms, as recommended in the Manual. Members of the purchases and stores committee consider it their duty and privilege to discuss purchasing and stores problems with any one visiting the exhibit.

ELECTRIC RAILWAY MATERIAL PRICES—AUG. 14, 1928

Metals—New York

Copper, electrolytic, cents per lb	14.54
Lead, cents per lb	6.2
Nickel, cents per lb., ingot	35.
Zinc, cents per lb	6.6
Tin, Straits, cents per lb	48.25
Aluminum, 98 or 99 per cent, cents per lb.	23.90
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	53.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	4.15
Somerset mine run, f.o.b. mines, net tons	1.825
Pittsburgh mine run, Pittsburgh, net tons	1.75
Franklin, Ill., screenings, Chicago	1.5
Central, Ill., screenings, Chicago	1.475
Kansas screenings, Kansas City	2.175

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb	2.80
Tie plates (flat type), cents per lb	2.15
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.875
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb	2.625
Sheet iron, galvanized (24 gage), cents per lb.	3.45
Galvanized barbed wire, cents per lb	3.20
Galvanized wire, ordinary, cents per lb	3.

Waste—New York

Waste, wool, cents per lb	18.
Waste, cotton (100 lb. bale), cents per lb.:	
White	17.25
Colored	13.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.1
White lead in oil (100 lb. keg), cents per lb.	13.75
Turpentine (bbl. lots), per gal	$0.58
Putty, 100 lb. tins, cents per lb	5.50

Wire—New York

Copper wire, cents per lb	16.625
Rubber-covered wire, No. 14, per 1,000 ft.	5.3
Weatherproof wire base, cents per lb	17.125

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.375
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.375
Sand, cu.yd., delivered	2.125

Old Metals—New York and Chicago

Heavy copper, cents per lb	12.375
Light copper, cents per lb	11.
Heavy yellow brass, cents per lb	7.25
Zinc, old scrap, cents per lb	3.25
Lead, cents per lb. (heavy)	4.67½
Steel car axles, Chicago, net ton	$15.75
Cast iron car wheels, Chicago, gross ton	12.875
Rails (short), Chicago, gross ton	15.50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50

Economic Changes Expected

Midsummer of 1928 probably marks the end of an economic era in the United States, the termination of a five-year period during which this country has been the temporary custodian of more than its share of the world's stock of monetary gold, according to the Cleveland Trust Company. As we pass into the second half of 1928 we appear to be leaving a period in which credit has vigorously sought employment, and entering one in which enterprises must compete for credit. The outlook is changed, and it is one to which we have become unaccustomed.

Preliminary figures on electrical energy consumption for July indicate that production has continued on a high plane, considerably above that of this time last year. Iron and steel, automobile and metal working activities are being maintained on an unusually high plane for this season of the year. There is every reason to believe that a high rate of activity will be continued at least until the fall months.

ADVERTISING LITERATURE

Superheater Company, New York, N. Y., has issued bulletin No. T-1 entitled, "The Elesco Superheater for Power Plants." This catalog describes and illustrates the design, construction and application of the Elesco superheater to power plants.

American Steel & Wire Company, Chicago, Ill., has issued a new 167-page rail bond handbook. It gives complete general descriptions and applications of Arcweld rail bonds, Arcon rail bonds, Flameweld rail bonds, stud terminal rail bonds and soldered rail bonds as well as technical data, descriptions of bonding appliances and a complete general catalog.

Fusion Welding Corporation, Chicago, Ill., has issued bulletin 128 entitled, "The Influence of Carbon in Steel Welding Rods" the first of a series which it plans on distributing every four to six weeks. Each bulletin will deal with some particular welding question and on which the work of its research department is able to throw light. Welders, plant superintendents and engineers interested in welding can receive these bulletins regularly by registering their names with the research department of the Fusion Welding Corporation.

Sherman Corporation, New York, N. Y., has issued a booklet entitled "What About Merger?" This report is a study of the current trend towards mergers and consolidations and is an analysis based on a digest of typical opinions received from more than 200 commercial and investment bankers.

Sullivan Machinery Company, Chicago, Ill., has just published bulletin 81-U descriptive of the Sullivan K-3 concrete breaker and bulletin 81-T describing the Sullivan L-8 rotator drill.

Link Belt Company, Chicago, Ill., has issued a new crawler crane book No. 995. It covers the complete Link Belt line of gasoline, diesel and electric crawler cranes of capacities up to and including the 2-cu.yd. heavy duty machine as well as standard locomotive cranes.

Roller-Smith Company, New York, N. Y., has issued a bulletin No. 300 descriptive of portable, direct reading, slide wire ohmmeters, types com, gom and som.

Volume 72 New York, Saturday, August 25, 1928 *Number 8*

Mr. Smith Pre-Judges a Great Industry

LAST week the JOURNAL, in commenting on Mr. Hoover's acceptance speech of Aug. 11, expressed the hope that this presidential campaign would be characterized on the part of both candidates by expressions of sound policy relative to economics and business. For once it seemed possible that the country might be spared those seeds of suspicion, unfairness and persecution against great industries which are frequently sown by candidates seeking popular indorsement.

But unfortunately, when the returns at the ballot box are an immediate objective, the temptation is strong to cater to the prejudices of those who are all too ready to believe that bigness alone in business is evidence of sinister motives and public exploitation. To cry dishonesty and lack of patriotism against those who have built great enterprises is always popular. And the candidate who resorts to this expedient is prone to accept as a remedy the theory that to put government further into business under one disguise or another insures greater honesty and regard for the public interest than is possible by private enterprise. Somehow the fact that the operations of public utilities under private initiative are subject to close public scrutiny and regulation is frequently overlooked. There is a deadly parallel between the utterances of the politician seeking votes and the screaming newspaper seeking circulation. The following paragraph in Mr. Smith's acceptance speech, delivered on Aug. 22, would fit appropriately on the editorial page of the typical yellow journal:

"No more dishonest or unpatriotic propaganda has ever been seen in this country than that disclosed by the investigation into the methods of certain utility corporations. Private corporations to gain control of public resources have procured the writing of textbooks for the public schools; have subsidized lecturers pretending to give to the country their own honest and unbiased advice; have employed as their agents former public officials, and have endeavored to mislead public opinion by the retention of the services of leaders of the community in various parts of the country. Highly-paid lobbyists penetrated into every state and into the legislative halls of the nation itself."

Thus Mr. Smith passes judgment upon the utility industry, before the Federal Trade Commission, duly constituted by the nation whose chief executive he seeks to become, has had the opportunity to do so. Small matter is it for the moment that in his advocacy of public ownership of water power he allies himself now nationally with the Pinchots and the Norrises. That he would commit the nation to a government ownership policy respecting water power development, which would lead inevitably to government competition in distribution and ultimately to the full extension of the public ownership program in all of its ramifications, those opposed to this scheme will be quick to note. And that he would go on with a public power project at Muscle Shoals and reproduce this fiasco at every available dam site in the country shows that he has much to learn about the power business. His views on these matters are disquieting. But it is of even greater concern at the moment that an aspirant for the highest office in the land would permit himself to prejudice the popular mind against a great basic industry with apparently little regard for the American principle that a man or a group of men are considered innocent until they have had a full and fair trial and have been adjudged guilty.

An Invaluable Handbook on Rapid Transit

EVERY large city in the country today faces, and for a number of years has been facing, the problem of providing rapid transit facilities for the millions of workers who must travel twice each day between their homes and places of employment. On the one hand growing street traffic congestion increases the need for speedy relief; on the other, the problem of financing stands as the greatest deterrent. The situation is little better in those cities that already have rapid transit lines, such as New York, Boston, Chicago and Philadelphia, than it is in those cities which have yet to initiate rapid transit programs, like Detroit, Pittsburgh and St. Louis. The need for additional facilities and extensions where rapid transit lines already exist presents a problem as acute as does that of starting rapid transit construction for the first time in those cities which have not yet undertaken this needed development.

In every instance the problem boils down to a single vital issue—that of financing the cost of construction. Though this problem is far from being generally understood either by the public or by transportation men themselves, there is general agreement on one point—that it is neither sound nor practicable to use private capital to be supported from the fares of the users of the service. Furthermore, it is quite generally agreed among all those who have given the subject earnest thought and study, that the cost of equipment, operation and maintenance should be carried by the fares charged, and that efficient operation is best insured by enlisting the initiative of private management free from the heavy hand of political patronage.

But there is no general agreement regarding an economically sound plan for financing the cost of rapid transit structures. Two plans have been tried; either the issue of city bonds, interest of which is paid from general taxation, or private financing, dependent on the ability of the system to pay its way out of car fares. Neither has worked. In each instance where an initial system has been financed by one or the other method or by a combination of the two, the plan has been unsatisfactory both to the community and to invested private capital, the transit facilities lag far behind requirements, and there is great difficulty in raising the money needed for new construction.

Obviously there is a crying need for a sound financing policy which may be adopted in the several cities in which

Digitized by Google

the situation is acute. The time is particularly propitious for a general attack on this baffling problem, because a number of cities are about to commit themselves for the future by entering for the first time upon rapid transit construction. It is particularly important that they avoid the costly mistakes of those communities that were forced to go ahead before they really understood the economics of rapid transit.

All of this points to the value of the work that was undertaken some years ago by the rapid transit committee of the American Electric Railway Association under the chairmanship of G. A. Richardson of Chicago. In three successive reports this committee put together the best thought on the question of rapid transit economics that was available from the experience of those engineers who have lived with this subject for many years. To this it added the views of public bodies and officials who have given the rapid transit problem long and deep study. And then, in addition, the committee compiled figures and data to show the relative cost and capacity of rapid transit lines, and other plans for providing transportation improvement, such as street widening projects.

This year, upon recommendation of the American Electric Railway Association executive committee, the reports have been re-edited and rearranged to form a single volume for handy reference. As a result there will be available in one place a comprehensive summary of the best thought and data now available on this extremely important subject. In this work the committee, which includes in its roster a most impressive array of rapid transit experts, has rendered a service of immense importance not alone to the local transportation industry but to American municipalities as well. The report is worthy of very careful reading and study by every local transportation executive. By putting it into the hands of the proper public officials they will perform an invaluable service both to their companies and to the communities which they serve.

Find Out What the Other Fellow Is Doing

IN THIS fallible world, men learn only by the experience of themselves or others. It is obvious that the more extended this experience the greater our knowledge of any subject. This is the reason that many railway men here feel that there is much to be learned from practice outside the United States and Canada. In response to this sentiment, considerable space has always been given in the columns of this paper to accounts of foreign electric railway practice and research.

After all, the conditions under which European electric railways operate are very much like those with which American railways have to contend. They have the same problems of track, overhead construction, equipment, maintenance, discipline, car routing and the merchandising of transportation.

One chief difference is that, as each country is largely a separate market unit, equipment in Europe has not become standardized so extensively as here. America offers such a large market by itself that mass production methods can be used here in many lines in which they would not be warranted in any single country abroad, but this condition has its drawbacks. Changes from standards are more difficult here than there.

The result is that in Europe experiments can be tried more easily. This probably accounts for the first use abroad of many practices which were afterwards adopted here, such as forced ventilation for railway motors. It also explains why we look to Europe for current experiments in other equipment whose value is not yet determined, such as bevel-gear drive, radial trucks, noise reduction and the use of light-weight metal in overhead appliances. In lines other than mechanical, European electric railway companies have also done very fine work, as in the examination and training of transportation employees and in the merchandising of transportation.

American managers and engineers can well give consideration to improve methods or practices, wherever employed. European managers and engineers frequently make visits here to attend our conventions and study our practices. Corresponding trips from here to inspect European railway methods would be very much worth while.

Remove the Barriers to Standardization

STANDARDIZATION of special trackwork in the electric railway industry is hindered by numerous differences of design, many of which are found to be only minor, according to William J. Nixon, department of city transit, Philadelphia, Pa., in an article appearing elsewhere in this issue. The variety of frogs, switches and other assemblies requested by electric railways is a serious handicap both to the trackmen themselves and to the manufacturers. It is almost impossible for a manufacturer to keep on hand a supply of material adequate to permit prompt delivery. Moreover, the large assortment of rails with which he must be provided increases overhead cost, adds to the price and may lead to expensive errors due to the difficulty of identifying rails of almost the same dimensions. Different types of rail sections vary only $\frac{1}{16}$ in. in some dimensions, which is no greater than the variation found on different rollings of the same rail. The contour of the rail, the cant at which the rail is set, and many other details enter into the construction of special trackwork.

Switches vary from the spiked-over rails of mine track to the highly complicated and adjustable switches used on some of the rapid transit railways. Although interesting, their many designs are one of the "bugaboos" of the trackwork manufacturer. For some time past the American Electric Railway Engineering Association has had under consideration a design for a standard tongue switch. On the one hand, its proponents assert that there would be a real advantage in the opportunity to purchase from any manufacturer, and eventually simplified maintenance would also result from its use. On the other hand, it is claimed that this new switch would not eliminate any of the designs now in use but would simply add a new design to the ones already in operation and perhaps discourage further improvement.

In all standardization there is a certain amount of difficulty. The disadvantages must be weighed against the advantages before a standard is adopted. It cannot be denied that the electric railway industry is burdened with an excessive number of trackwork designs. Standardization is hindered, however, by the firm adherence of many way engineers to their own pet designs. The attitude of the electric railways toward standardization does not differ greatly from that of other industries. Every industry tends to imbed itself in a network of obsolete and semi-obsolete equipment and methods of procedure. When a new device is developed to replace

Digitized by Google

older apparatus, the one of ancient design is carefully preserved for use in a few remote places where it is thought to work better than the new one. This procedure continues until increased overhead and diminished profits force into use drastic revisions and standardization on a new basis. To achieve standardization some minor advantages of special design must be thrown away for the sake of greater simplicity and economy in the long run.

A Code That Makes for Progress

MUCH has been accomplished by the Central Electric Railway Association in the development of the freight business in its territory. Not the least important move it has made is the standardization of much of the freight equipment so that it is interchangeable over all of the lines. It has gone even further; it has standard rules and a set of uniform charges for such repairs to equipment as must be made on foreign lines. These standards, worked out in considerable detail by the Central Electric Railway Master Mechanics' Association, were adopted and put in effect something more than a year ago. They proved of such value that the committee in charge was prompted to follow through with a revision, taking into account the experience gained from the actual use of the rules.

The code of rules, standard forms, and uniform charges for repairs to equipment have now been grouped together. While the JOURNAL published the original code and the uniform charges at the times when they were first adopted, there have been enough revisions and amplifications to justify a republication of the material as a whole. The first installment, published this week, consists mainly of the code of rules. It will be followed by the standard forms and the list of uniform charges. The whole has been placed in the note-book section, uniform with other material published for the benefit of the maintenance forces.

While in no other part of the country does the opportunity for interchange of electric railway freight equipment exist as in the C.E.R.A. territory, the code and the inspection cards represent the most progressive practice and should be of value to railways elsewhere. To those in the central territory the information is, of course, invaluable.

San Francisco Has a Chance to Show Its Good Faith

SAN FRANCISCO has every reason to be proud of the conduct of the Market Street Railway. Beset by the imminent menace of the municipalization of its lines and with its franchises soon to expire, the company has carried on courageously in the face of great odds at a 5-cent fare. When Samuel Kahn, president of the railway, referred recently to the improvements in service and in property there, the comfort, care and courtesy of operation, and the new transportation features originated under the present direction as having commanded the attention of the patrons and the transportation world as well, he was telling the plain truth.

Mr. Kahn wants only one thing. He wants his company freed from the impending hocus pocus of politics likely to attend the expiration of the franchises before the city has determined on the course it will pursue as to taking over the property. To that end he has indicated the willingness of his company to accept revocable operating permits to continue until the city is ready to act. It is a reasonable suggestion, and in the last analysis is one made in the best interests of the railway and the city, if the public is to continue during the period of purchase negotiations to enjoy service of a type which the railway has furnished in the past. The revocable permit would be accepted by the company with the understanding that no claim for value would be made on that account in the event the city subsequently exercised its right to revoke the permit for the purpose of acquiring the property. That is a just proposal.

In the face of unpropitious prospects such as are likely to attend the expiration of franchises, the railway might have assumed an attitude of indifference. That has happened in other similar cases. But the management at San Francisco has gone along progressively, guided by the ideal that the term public utility meant all that the words connote. That has been a fortunate thing for the residents of San Francisco. It remains to be seen whether the elected representatives of the people of San Francisco will treat with the company in this matter on a basis comparable with the attitude of the railway in dealing with the car-riding public.

By Rail, by Water, by Highway and by Air

CHANGING aspects of transportation are reflected in the avowed intention of the Transportation Survey Commission of St. Louis to conduct the broadest kind of an inquiry into the needs of that community. It will consider the requirements of a city twice as large as the present St. Louis, and will also inquire into the probable growth of the adjacent territory on the East side of the Mississippi and the counter effect of the growth of that territory on St. Louis.

The goal of St. Louis has long been a population of 1,000,000. It is a legitimate aspiration, but the realization of that aim carries with it concurrent obligations. Transportation by electric railway, by water, by motor vehicle, by steam railroad and by air will all be considered. The supplying of rapid transit is, of course, one of the most important phases of the study. Fortunately the electric railway problem at St. Louis has been studied previously. Whether rapid transit for St. Louis will take the form of elevated railways or subways or both is still to be decided. The new commission will take up this matter where others have left off, but will not supplement the previous findings unless that appears to be necessary.

The commission is unalterably opposed to any duplication of facilities. It is on record to that effect. The effort will be to provide for the co-ordination of the agencies which already exist. Best of all, the commission is cognizant of the financial problems involved. It would appear that any plan which is ultimately evolved will take fully into consideration the ability of the community to pay the way. Some of the probable changes will also include the determination of the question of whether private or public ownership is best. This presumably applies to any rapid transit lines that may be included in the final recommendations. There is evidence that the bearing of such construction upon fares, if the lines are run privately, is fully recognized.

This work appears to be starting auspiciously. The commission apparently is animated by "The Spirit of St. Louis." It is to be hoped that its accomplishment will not fall short of that spirit.

Divergence of Special Trackwork Design Hinders Standardization

By William J. Nixon
Department of City Transit, Philadelphia, Pa.

Though track layouts are becoming more and more specialized, manufacturers are handicapped by the many forms of frogs, switches and other assemblies requested by electric railways

STANDARDIZATION is receiving a great deal of thought today. Many differences in design are found to be only minor, and in special trackwork this is especially true. However, the differences which do exist are a serious stumbling block for both the track men of the electric railways and the manufacturers. At one time special trackwork was a "home-made" proposition. Now there are several frog and switch plants which specialize almost exclusively on the one product. With the many types of rails in use at present for the various types of special trackwork requested, it is almost impossible for any manufacturer to have an adequate supply of material on hand.

Much more progress has been made on steam railroads than on electric railways in the standardization of special track layouts. This should be expected, since there are fewer special conditions to be met on steam roads and, generally speaking, the curves are of much larger radii and are designed for higher speeds. Also, most track for steam railroads is laid in the open, whereas for electric railways the most is laid in pavement.

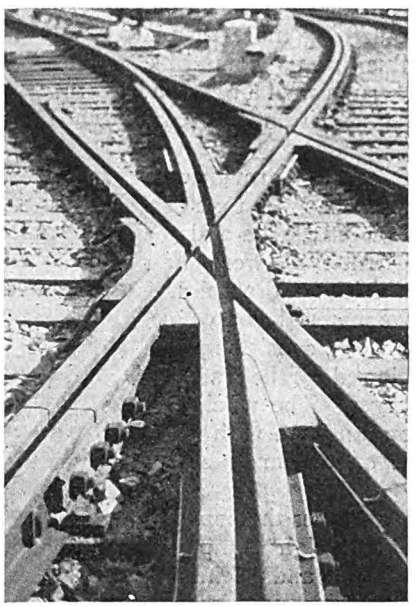

Fig. 1 — Unusually well-designed modern compound frog intersection based on A.R.E.A. design for rail-bound manganese steel

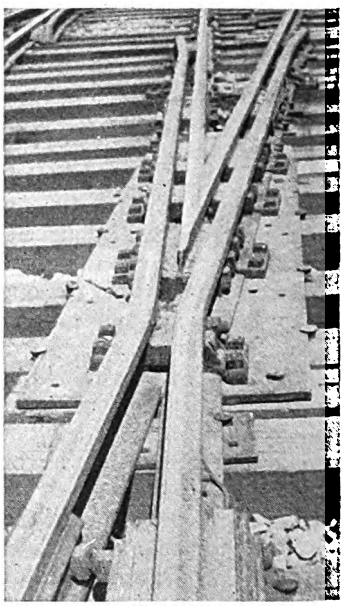

Fig. 2—Turnout frog built without manganese steel. Though on a siding its point showed considerable battering in a few weeks

A steam road can get along nicely with perhaps three lengths of switches and three angles of frogs as standard, because the long radii permit the use of straight pieces. Street railway practice is practically the opposite. Wheelbases are short, high speed in street traffic is impracticable and a derailment at the slower speeds is not a serious matter. The streets often are narrow and street railway curves are usually very short. Moreover, there are often several curves at one street intersection, so that the special trackwork becomes very complicated. Obviously, standardization on electric railways is almost impossible and usually is not attempted beyond standardizing switches, mates and some crossovers.

Track design for the high speeds of steam trains and the narrow streets to which most electric railways are confined, has been developed for the long and heavy trains of the subway and elevated lines. As a result, there are three distinct schools of practice: the open T-rail work as used by the larger steam or intercity roads, track as used in street paving by electric railways and a combination of the two as developed by rapid transit lines.

Cost of Trackwork Increased by the Many Types of Rail in Use

Examination of the three rail sections, the Reading Company 100-lb., the Pennsylvania System 100-lb. and the A.R.A. section "B" 100-lb., reveals that they are quite similar; in fact, in some dimensions they only vary by $\frac{1}{16}$ in. This instance could be multiplied. Inasmuch as different rollings of the same rail often vary by as much as $\frac{1}{16}$ in. it becomes difficult for the manufacturer of special trackwork to identify these rails. Moreover, the great variety of rails he must keep on hand increases his overhead, adds to the cost of work and may lead to expensive errors.

A point for the customer to remember is that certain rails are not used extensively and the manufacturer may not have them in stock. In this case it would be necessary to send rails to the manufacturer for fabrication

Digitized by Google

and the delivery would be delayed considerably. The contour of the rail must be kept in mind. The head of the A.S.C.E. rail section has parallel sides. Most other rails of 100-lb. section and under have the sides of the rail head diverging or sloping slightly. A slight slope may be desirable, but an extreme slope is dangerous. On sharp radius curves or on switch points an unreasonable slope to the side of the rail head may be sufficient for the wheel flange to climb the rail or to pick the switch point.

A comparatively new development in trackwork is the practice of canting the rail to follow more closely the contour of the wheel tread and to take the side thrust of rolling stock so as to distribute pressure more evenly on the ties. Canting of rails has been definitely recommended by the A.R.E.A. and is rapidly coming into general use. Where rails are canted special provision must be made for the special trackwork.

The development of special trackwork has been interesting. In one of the old log railroads two movable logs were used for switches and a third movable log, pivoted in the center, was used as the frog. In the old-fashioned stub switch two movable rails were butted against two fixed rails for the straight run and swung to two other fixed rails for the curved run. With an old type of frog a member of the yard crew would run ahead of the cars to take a movable piece out of one slot and drop it in the other slot to allow the cars to pass through. A stone body frog with metal insert was the precursor of the manganese steel insert frog of today.

Manganese Steel Strengthens Trackwork

When a piece becomes too complicated, it sometimes can be built entirely of manganese steel for very little additional or even less cost. That is particularly true of tongue switches for street railways. Solid manganese steel construction also has the advantage of being free of stretching bolts, loose rails, etc. A modern compound frog intersection of rail-bound manganese steel and based on A.R.E.A. design is shown in Fig. 1. In Fig. 2 is shown a frog without manganese steel. A rule placed across the point of this frog showed a considerable battering down of the point in a few weeks, even though it was located on a siding.

Other types of frogs are the adjustable spring rail and the self-guarded frogs. The adjustable frog uses shims

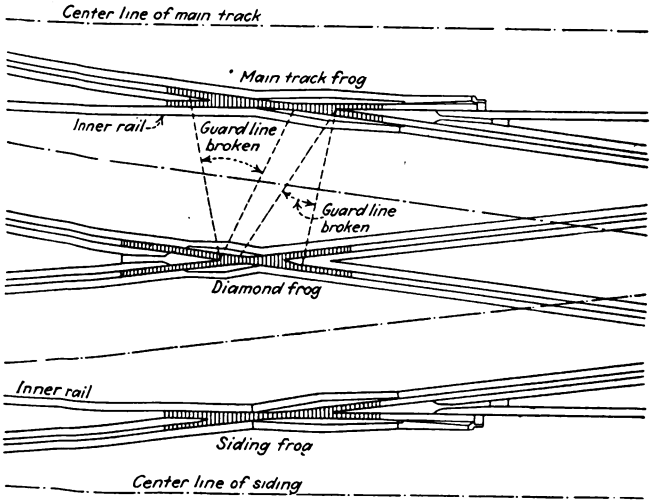

Fig. 3—Double crossover in which the diamond frog is unguarded at its critical point for a distance of several feet and the main track frog just barely guarded by the diamond

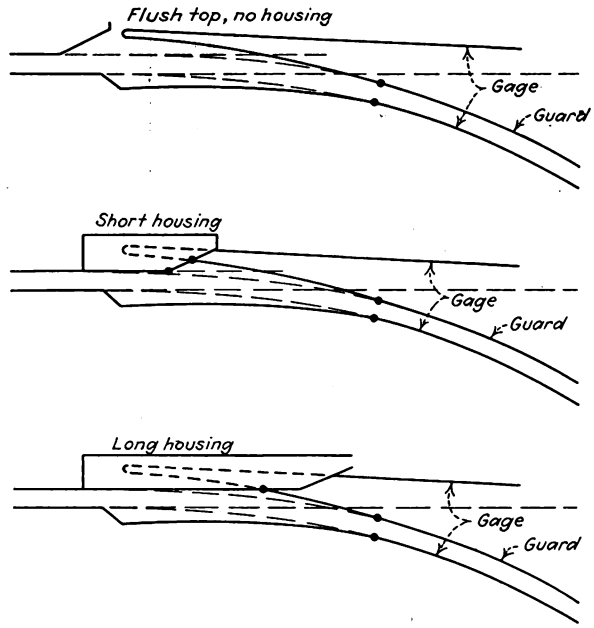

Fig. 4—Three types of guarded switches used for short radii

in its flangeway and laps at its joints to provide for wear. It has not come into general use.

The spring type of frog usually has one flangeway held rigid and the other flangeway, when not in use, held closed by a spring bearing against a movable rail, in this way favoring the main line both for flangeway and bearing under the wheel tread. A double form is often used in open T-rail track by electric railways using very narrow wheel treads. Spring frogs were more popular at one time than they are today, although one large steam road reports abandoning them and now returning to their use in a modified form.

The self-guarded frog is the newest development. In this type, instead of using the separate guard rails opposite the frog a guard is cast directly on the tread surface of the casting and operates against the edge of the wheel tread instead of the wheel flange. It has been adopted as standard by some roads while others use it only in freight yards.

Much thought has been given the subject of guarding frogs properly. For this purpose a number of guard rails have been developed. Some of these are very simple while others are quite complicated. The long wing rails of the frog shown in Fig. 2 are particularly interesting. They are formed by adding guard rails to the end of the frog. The guard rails absorb some of the wheel blow before the wheel enters the frog from the wing end and have a tendency to keep the wheel truck straight after leaving the frog. Railroad men claim that considerable friction exists in this type of special trackwork, particularly in the case of heavy freight trains, so the A.R.E.A. designs favor very short guard lines. A section of a double crossover diamond in which the diamond frog is unguarded at its critical point for a distance of several feet is shown in Fig. 3. The main track frog is just barely guarded by the diamond.

Judging from the variety of designs, switches are the most interesting part of and the "bugaboo" of trackwork. They vary from the spiked-over rails of mine track to the highly complicated and adjustable switches of some of our rapid transit railways. The most popular switch and the basis of all designs of today is the ordinary split switch. Even the tongue switch used in paved

Digitized by Google

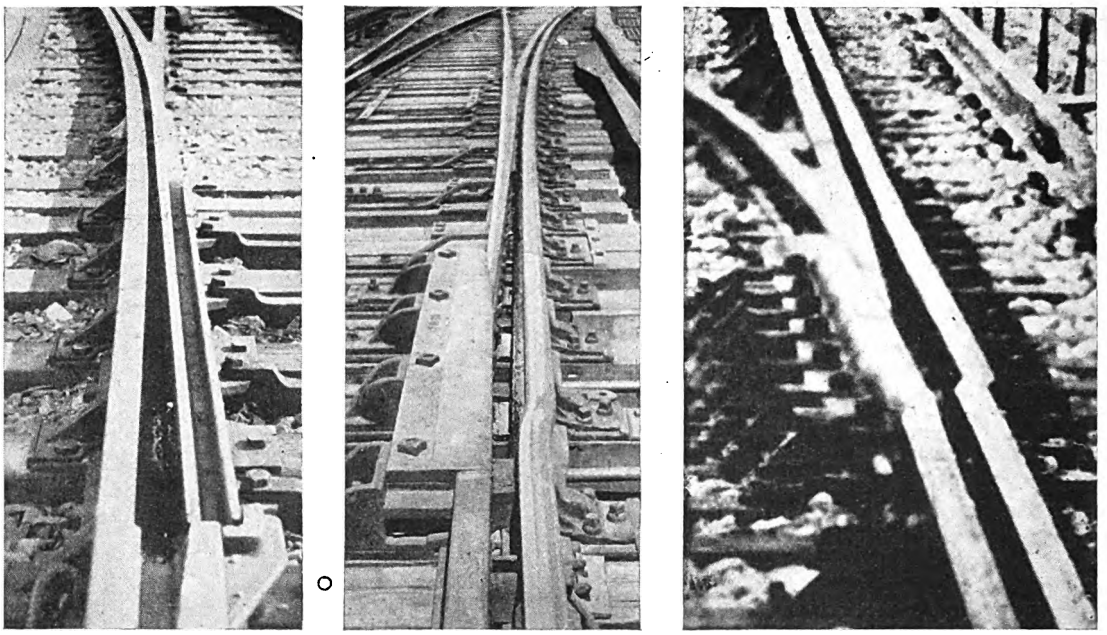

Fig. 5—In the left view is shown a flush top guarded switch as used in Philadelphia. The center view shows a short housing as installed in New York, while the right view is of a long housing used in Boston

streets is but a modification of the split switch design, using instead of a rail a tongue 2 in. or 2¼ in. deep. Its mate usually has its flangeways open in both directions and the flange of the wheel often bears on the bottom of the groove.

Some split switches are made so that the points may be staggered by setting the main track switch rail one tie space toward the frog. This setting has the effect of bringing the guard rail to a point where it will lap the turnout switch rail, thus having a tendency to throw the car weight farther back on the switch rail to a point where it is thicker and better able to stand the blow. This position of the guard rail also has a tendency to eliminate the necessity for housing. Protecting the points results in a considerable reduction in wear.

For extremely short radii, guarded switches have been developed. Three types of guarded switches are illustrated in Fig. 4—one with flush top, one with a short housing over the point, the housing acting similar to the guard rail of the split switch with staggered points, and one with full housing, this last type giving the smoothest guarding. The three types are further illustrated by Fig. 5, which shows, respectively, the flush top switch as used in Philadelphia, the short housing as used in New York and the long housing as used in Boston.

Regenerative Braking Tested on P.-L.-M. Locomotives

REGENERATIVE braking tests recently have been carried out on one of the large 1-B-B-2 electric locomotives of the Paris, Lyons & Mediterranean Railway. The locomotives were built by the Oerlikon company. The trial locomotive was subjected to tests on the electrified system between Culoz and Modane with a view to ascertaining whether the operation of the locomotive was affected in any way by sudden fluctuations of pressure, such as are encountered during service.

The trials were carried out with a trailing load of 500 tons (25 cars), the pressure at contact line being raised or lowered by about 500 volts every 20 to 30 seconds. The train was, in each case, accelerated down the incline, after which the speed was gradually reduced by electric braking. Throughout the tests, braking took place without any noticeable jerks and without disturbance in the motor. Some of the readings are as follows:

Speed M.P.H.	Controller Notch	Motor Grouping	Braking Current, Amp.	Exciter Current, Amp.	Pressure at Contact Line Volts
54.6	8	Parallel	500	1,000	1,700
53.9	8	Parallel	1,000	700	1,250
28.5	11	Series parallel	500	1,000	1,700
26.6	11	Series parallel	600	750	1,200
20.4	9	Series	400	800	1,500
16.1	9	Series	400	600	1,000

It is said that the type of individual drive adopted has given excellent results during the two years the locomotive has been in service. With locomotives designed, as here, with outer frame and fixed gears, this drive takes the form of a quill working in conjunction with articulated couplings acting through springs and arranged on either side, between wheel and frame; the couplings are entirely unprotected so that they are easy of access. Unlike the individual drive with totally enclosed coupling and automatic lubrication by pump, the present drive is arranged for periodic lubrication of coupling pins by hand, with thick oil, by means of a Tecalemit device. The lubrication has to be carried out after a certain mileage fixed by experience; when carrying out this operation, there is no need to move the locomotive as all the points of lubrication are accessible in every position of the locomotive. The fact that the coupling has, up to now, required no attention testifies to its reliability. An inspection of the pins and bearings has revealed no visible wear.

Apart from this, and the Burgdorf-Thun drive, the Oerlikon company has evolved a further type of individual drive which is being installed on a trial locomotive with quill and outer frame. This locomotive is designed for a maximum speed of 86 m.p.h. The drive embodies a totally enclosed coupling arranged on one side between the driving wheel and the motor.

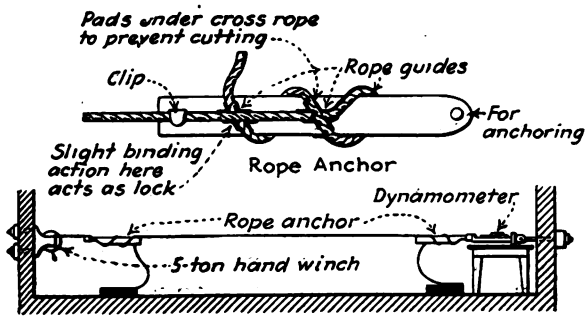
Testing of Work Ropes Essential to Safety

By M. R. Sumner
General Superintendent of Construction
and
G. E. Balch
Superintendent of Materials
Byllseby Engineering & Management Corporation, Pittsburgh, Pa.

ROPE plays an important part in any number of jobs on a railway property. Particularly is this the case where electric power and transportation activities are carried on under the same management, and involve the employment of maintenance and construction crews from the shops and overhead lines department. On account of the large volume of construction work which was handled for the Philadelphia Company and its affiliated operating companies by the Pittsburgh branch of the Byllesby Engineering & Management Corporation in 1927, we found ourselves at the beginning of this year with a large supply of rope on hand, varying as to size and condition. Nearly all of this rope had been used and much of it was soiled with grease and mud. As there is very little salvage value in second-hand rope, and as we are constantly using it in our work, the problem was how to make the best use of this rope and yet do it without jeopardizing the lives of our workmen. Reference to various handbooks for information relative to the loading that might safely be applied to various sizes and kinds of rope disclosed no uniform or reliable published data on this subject and it became necessary to develop original information to meet our requirements.

Since nearly all of this rope is used in blocks (these tests do not concern steel rope, which is more commonly called cable) it was necessary to know the forces set up when the ropes were so used. Two tests were made to determine these values. In the first, a set of steel blocks having a sheave diameter of 1½ in. was used, while the second used a set of wooden blocks, having a 3-in. sheave diameter. In the testing layout, the load end and the dead end of the rope were anchored to dynamometers, and a fall line pull of 500 lb. was applied. By varying the number of sheaves the relation between the load and the dead end pulls to the fall line pull could be established. This information gives a foundation for the actual testing of the ropes, and is printed on the reverse side of the rope testing tag, a sample of which is reproduced herewith. One of these tags, with the testing data filled in with ink, it attached to each length of rope after it is tested. This tag informs the foreman who receives the rope on a job that it has been tested, and the maximum safe loading he can put on it.

The rope anchor illustrated here is an original development which has been devised so that the position of the rope at the anchor end and also at the dynamometer end is the same as if the rope were operating in a rope block. These rope anchors have been made in several different sizes, as may be noted in the accompanying table. They were made to order for us by a steel fabricating shop in Pittsburgh.



Rope Testing Set Up - Safety Guard Screens at Both Ends not Shown

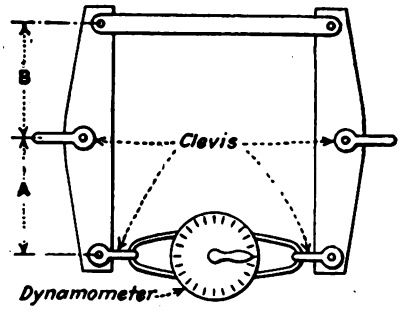
Rope Anchor and Rope Testing Set Up

The illustration shows a rope anchor, developed to hold an "endless" rope without any cutting action. The anchoring action is practically all due to snubbing. The "lock" binds the turns effectively. All bends are so designed that the radius is the same as that of a sheave for that size rope.

Anchor Diameter for Different Sizes of Rope

⅜ in. and ½ in. rope—2¼ in. diameter pipe
⅝ in. and ¾ in. rope—3½ in. diameter pipe
⅞ in. and 1 in. rope—5½ in. diameter pipe
1⅛ in. to 1⅜ in. rope—8 in. diameter pipe

Two operators are needed in making the tests. One man operates the winch while the other reads the dynamometer. The test value marked on the test report which is attached to the rope is placed 33⅓ per cent lower than the actual results obtained to provide a factor of safety.



Apparatus Developed for Special Rope Tests

For tests involving forces not taken care of by the dynamometers, the special piece of apparatus illustrated has been developed.

Ratio B to A		Capacity
...	Small dynamometer	0–3000 lb.
1–1	Small dynamometer	0–6000 lb.
1–2	Small dynamometer	0–9000 lb.
...	Large dynamometer	0–10,000 lb.
1–1	Large dynamometer	0–20,000 lb.
1–2	Large dynamometer	0–30,000 lb.

Test on Rope Blocks

A large percentage of the rope used in the construction department is made up into sets of rope blocks. It is, therefore, important to know the forces at work when using these blocks, in order to define safe loads that may

REVERSE

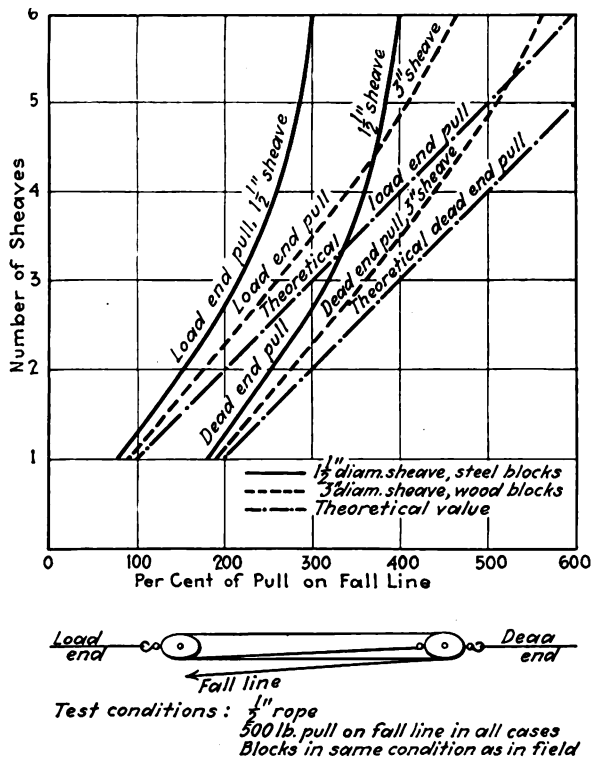
Rope Testing Report Card

The sketch shows the "Rope Testing Report" card which is attached to each rope after it is tested. Both testers sign the card. A table of safe lifting capacities for blocks is on the reverse side of the card. These values were obtained by multiplying the per cent of pull on fall line load end, Table II, by the allowable strain—Table I.

be handled. Two tests were conducted to determine these values.

In the first test, a regular stock set of ½-in. steel rope blocks were used with a sheave diameter of 1½-in. In the second test, a set of wooden blocks were used with a sheave diameter of 3 in. The test set-up was so arranged that dynamometers read the pull on the fall line, the load end, and the dead end. The load end and the dead end were solidly anchored while the fall line was attached to the winch. A fall line pull of 500 lb. was applied in all cases and the other two dynamometers read.

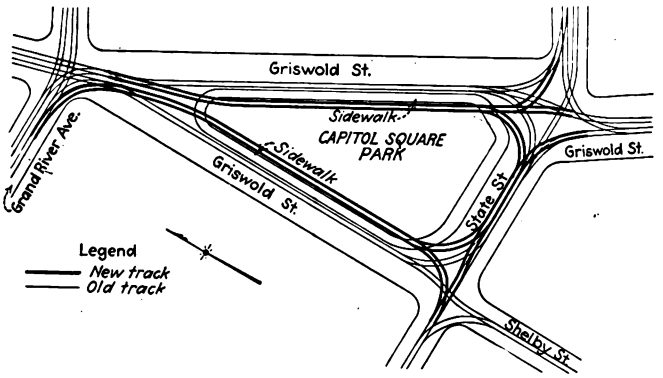
Only one size of rope was tested, namely; ½ in. It is assumed that the same percentage of friction loss would occur in other sizes. We have found that the cost of making these tests, based on the methods herein described, averages about 2.5 per cent of the value of the rope tested.



Graphic results of rope tests

Congestion Reduced by New Track Layout

RECENT track changes around Capitol Square Park, the downtown termini of the Grand River, Fourteenth and Myrtle Avenue car lines of the Department of Street Railways, City of Detroit, eliminate much traffic congestion at this important section and permit passengers to board and alight from the cars in safety. The new tracks were laid on the park side of the sidewalks which are now used as boarding platforms. The removal of tracks and safety zones from Griswold Street



New track layout around Capitol Square Park, Detroit, showing the tracks located on the park side of the sidewalks

has taken the street cars entirely away from the vehicular congestion along both sides of the park, and has eliminated practically all danger to passengers waiting to board the cars, all of which operate around the park in a counter-clockwise direction.

With the new layout it was possible to construct a clearance curve at Grand River Avenue and Griswold Street which has very noticeably decreased the congestion of all kinds of traffic at this busy intersection. Some years ago the westbound track on State Street, south of the park, was removed to conform with certain route changes. This change left the eastbound track south of the street center. As a part of the recent program this track was centered, permitting a faster movement of all traffic along the street.

Fourteenth Avenue cars now discharge and receive passengers, and Grand River Avenue cars discharge passengers on the west side of the park at State Street. Passengers board the Grand River, Fourteenth and Myrtle Avenue cars near the north end of the park on the east side of Griswold Street, where a raised platform 200 ft. long will soon be constructed. This platform will be used as a prepayment station for the Grand River and Myrtle Avenue lines. Fourteenth Avenue cars will continue to receive passengers just north of the prepayment station.

To co-ordinate its service fully, the Coast Cities Railway equipped a waiting room and terminal where the trolley and bus lines join

Coast Cities Railway Extends Co-ordinated Service

Passengers from Asbury Park to Manasquan, N. J., use trolley to Belmar, and there transfer to bus for remainder of trip. Rail service south of Belmar has been replaced because of indirect routing and high operating cost

FOR many years local transportation between the New Jersey coast towns of Manasquan, Sea Girt, Spring Lake, Como, Belmar, Avon, Bradley Beach, Ocean Grove and Asbury Park was furnished only by a steam railroad and a street railway line, partly double track and partly single track. In 1924 bus service was established to connect all these communities. Double-deck buses were selected for use over this route, as the territory is picturesque and operation is confined to summer months. Now service on the portion of the railway system between Manasquan and Belmar has been discontinued and single-deck buses are used to provide transportation in this area. Early this summer the New Jersey Board of Public Utility Commissioners approved the petition of the Coast Cities Railway to abandon the line and to substitute bus service.

The company based its plea to the board on operating figures which showed a considerable loss over the past two years. The southerly portion of its line was particularly expensive to maintain because of several bridges and because the track was old and constantly in need of repair. Along this part of the New Jersey coast are many small bays and fresh water lakes and the railway had to construct a considerable number of bridges to provide a reasonably direct route along the coast. Many of these are long and expensive to maintain. One of the bridges, that over Wreck Pond, between Spring Lake and Sea Girt, is 1,000 ft. in length. The original cost of these was extremely heavy because the company not only had to construct the bridges and do a vast amount of filling in, but also because it had to purchase private rights-of-way for them.

Indirect Route Was Used for Rail Line

The route is indirect, and is approximately 4¼ miles long, even though the two points it joins are only a little more than 3 miles apart. The route has many turns and at several points goes east and west, even though the main direction of travel is north and south. There are several places at which the route might have been shortened, but instead it detours two or three blocks out of the way and then comes back to the direct same north and south line. Because of the many small bodies of water which indent the coast, the railway was forced to go inland at several points to bridge the bays.

There were some other difficulties that affected the route also. At the time the line was constructed the population was very scattered and the various little centers were not very well built up. In some the population was concentrated near the coast, while in others it was farther inland. Because the territory was not thickly populated, the rail line was obliged to go through as many centers of population as it could, and for this reason did not follow a very straight route. Inability to secure permission to build a line on certain residential streets was another difficulty encountered. At two or

Digitized by Google

three places along the route the railway was obliged to take an indirect route because the residents along the logical route would not permit the rail line. Because of the long route, the ride from Belmar to Manasquan was quite long.

Numerous "Bottlenecks" Harmful to Schedules

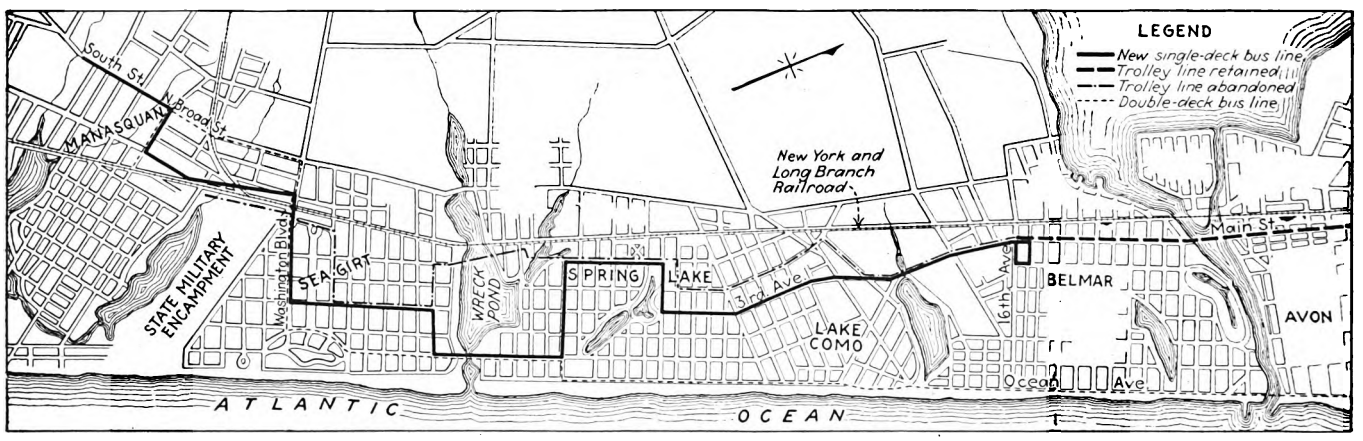
Adding to the complexities of operating this portion of the route are numerous "bottlenecks" which hindered the progress of the cars considerably during the summer months. The coast cities have an enormous influx of pleasure seekers during the summer months, especially over the week-ends, and thousands of automobiles are driven over the north-and-south arteries along the coast. The bays and lakes along the coast make numerous "bottlenecks," and because there are no alternate routes to take in certain places, the railway was forced to go through these narrow points also. Sometimes traffic is held up for long periods at these places, and on busy days when traffic is moving its fastest the progress is very slow. Naturally, this had a disastrous effect on the schedules of the trolley cars.

Another very vital factor which affected the railway is the wide variance of travel in the summer and winter months. The permanent population of the cities served by the Coast Cities Railway is approximately 50,000. In the summer, however, vacationists and transient pleasure seekers swell the population to more than 600,000. Most of those who go to the beach resorts come by railroad and in moving from city to city use the local transportation system. However, the season, when the business is heavy is very short, usually from the first of July until the middle of September, and as a result a serious economic and operating difficulty must be met. The portion of the rail line that was abandoned was affected greatly by this seasonal change in traffic. In the summer months the line was very profitable, but for nine months of the year it did not carry enough passengers to meet its operating expenses. The need for training many operators in the summer months when the traffic increased, and the necessity of releasing the extra employees in the fall, offered a slight problem, but one not peculiarly confined to this portion of the route.

Competition Steadily Increased

The presence of competition has exacted an enormous toll from the railway and the portion of the line abandoned had been pressed, perhaps, to a greater extent than the other routes. Of course, the ever-increasing number of private automobiles was the biggest single factor. But in addition to this was the attractive double-deck bus line operated by the railway, which, although it served the territory immediately along the coast and not inland, carried many passengers that otherwise would have used the trolley cars. People preferred to use the double-deck buses because they follow a scenic, and therefore much more attractive, route and make better time. Inasmuch as the railway depended on an enormous business in the warm months to make a profit for the entire year, the decrease of the summer travel on the railway line was very harmful.

As previously mentioned, the old track cost a vast amount of money each year to maintain. The entire length of track was much in need of repair and the company was faced with the problem of reconstructing the entire route if it was to continue giving service over it. The cost of rehabilitating the line would have cost many thousand dollars and was not warranted by the business done on it. The overhead, too, required excessive maintenance and would have needed replacements in certain sections.



Map of a section of the Coast Cities Railway lines showing the new single-deck bus line and the abandoned trolley line from Belmar to Manasquan, and the lower portion of the double-deck bus route

The company had learned from its other operations that the bus was sufficiently popular to be the answer to the problem, and accordingly entered a petition to substitute buses on the lower portion of its route. Inasmuch as the rail line was continued as far down as Belmar, the service was extended from Belmar as far as Manasquan, giving a co-ordinated service between Asbury Park and the lower cities, over rail and bus.

Before the institution of this bus line the company had been operating not only the double-deck bus line from Long Branch to Manasquan, but also a single-deck bus line from Asbury Park to Long Branch. The management had learned that the buses were better able to get through the "bottlenecks" and were better suited in other respects for this peculiar type of service. It found also that bus operators were easier to train than street car operators, because the majority of men today drive automobiles.

The new co-ordinated service was put into effect in the early part of June of this year, following the granting of permission from the Board of Public Utility Commissioners. Although the bus route is not much more direct than the old rail route, it reaches a greater portion of the population and still covers the distance in considerably less time. The buses are operated on a twenty-

Digitized by Google

minute schedule, while the street cars to Belmar maintain a headway of ten minutes, with a headway of five minutes during rush hours.

The company is using for this service three buses that were formerly used on one of its northern routes. All are 29-passenger, single-deck, Yellow coaches. They are painted a uniform light gray, the standard color of all equipment. During rush hours this service is augmented with additional buses on a fifteen-minute headway.

To make the co-ordinated service complete, the company rented space in an attractive building near the end of the rail line and made it into a very pleasant

The bus and trolley terminal is very attractive and has several conveniences for the patrons

waiting room. The room has a number of chairs, a telephone booth and other conveniences for the patrons, and being but a few steps from the car line is easy to reach. Passengers leaving a street car can easily find the terminal, for a huge sign reading "Bus and Trolley Terminal—Coast Cities Railway Company," is suspended outside of the building. Two views of the terminal are shown in accompanying illustrations.

The company which operated the street railway from Manasquan on the south to North Long Branch on the north, prior to 1924, was known as the Atlantic Coast Electric Railway. The company was then taken over by a new management, reorganized and named the Coast Cities Railway Company. At that time no buses were being used and the new management, aware of the need for this type of service, organized a new bus company known as the Atlantic Coast Transportation Company. A comprehensive system of feeder bus lines centering in Asbury Park was laid out to serve territories not reached by the trolleys and to give a co-ordinated bus and trolley service. In addition, two double-deck bus lines were established, one running north from Asbury Park to North Long Branch, and the other running south from Asbury Park to Manasquan. The greater portion of the route was over the famous Ocean Avenue, which follows the shore line very closely, and was intended to secure the patronage of sightseers and vacationists at the summer resorts. The line proved profitable and over a large portion of the route did not harm the rail lines.

To provide this service the company purchased 23 Yellow coaches, of which ten were single-deck and thirteen were double-deck. Owing to increased demand for additional service it was necessary to purchase six more buses, making a total of 29. These are of the semi de luxe type and are in great demand by the riding public. The fares for the single-deck line were established at 10 cents, whereas the double-deck lines were operated on a zone fare basis, three zones for each line, at a fare of 10 cents per zone.

During the first few months of bus operation the city line routes were changed several times to determine the most satisfactory ones for permanent use, and not including the new line from Belmar to Manasquan, they now consist of three separate lines covering a wide territory west and southwest of Asbury Park. In addition to these lines the company also operates a local bus line between Asbury Park and Long Branch.

After the bus service had been established securely, the company ventured into the taxicab business, giving a complete co-ordinated service in Asbury Park of trolley, bus and taxi, and giving taxi service to Red Bank and Lakewood, two cities not served by any other local transportation means. Full details of the new co-ordinated system of street cars, buses and taxicabs were given in an article by H. T. Pritchard, vice-president Utilities Power & Light Corporation, New York City, in the Dec. 12, 1925, issue of ELECTRIC RAILWAY JOURNAL.

Although the Atlantic Coast Transportation Company and the Coast Cities Railway were both under the same financial control, it was felt desirable to make them one company and a petition to combine them under the name of Coast Cities Railway Company was approved on Oct. 8, 1927, by the Public Utility Commissioners.

Car and Bus Directory for Washington Patrons

STREET car and bus lines of the Capital Traction Company, Washington, D. C., are shown on a map and described in detail in a directory recently issued by the company. The folder was designed to give complete information about all car and bus lines for both residents and visitors in Washington.

The map shows all the car and bus base routes, the individual routes being indicated by various symbols. Many points of interest in the city, including the United States Capitol, the Library of Congress, the White House, the Washington Monument, Bureau of Standards, and several other government buildings, are indicated on the map. The indication of these points is especially valuable to visitors, since the map shows in addition to the regular bus routes and street car lines, the four parlor bus routes operated by the company. These pass most of the points of interest.

The description of the individual street car, bus and

Digitized by Google

coach lines include the terminals of each, the streets traversed, the points of interest along the routes and the headway maintained during the non-rush periods. In addition, the folder gives the schedule of all night cars and buses; the first and last coaches, buses and cars on week-day schedules; and the first and last cars on Sunday schedules. The rush-hour schedules are not given in the folder, for the rush-hour cars and buses are all in addition to the regular base equipment and do not affect the base schedules as described.

A Simple Formula for Car Replacement Calculations

Many factors should be given proper weighting in determining the advisability of replacing old cars

By H. S. Williams
Assistant Superintendent of Equipment Department of Street Railways, City of Detroit, Mich.

In the Aug. 20, 1927, edition of the Journal on page 302 an article was published setting up a formula for determining, under any given set of conditions, whether retirement of old-type street cars and their replacement with new equipment is justified. Since that time considerable interest has been manifested in the method shown and this has prompted a closer study of the problem, which, in turn, has shown the desirability of elaborating somewhat on the original formula to the end that it be more easily applicable.

In order to make the plan clear and to avoid the necessity of referring to the previous presentation, some of the original matter is repeated here. As a basis, it is assumed that when the annual cost of maintenance, operation and carrying charge of a new car is equal to or less than the similar cost of an existing old-type car, the purchase of new equipment is justified and desirable. However, in order that a true comparison of costs may be set up, it is necessary to apply certain adjustments. If a car is replaced by another, it is the net cost of the new car which should be used in calculation. This explains why in the formula which follows the salvage value of the old car is deducted from the cost of the new car.

On the assumption that it is economically correct to amortize the cost of the new car, the average annual interest charge will be one-half of the interest rate and the carrying charge will be the net car cost multiplied by this average interest rate plus the amortization rate. To the carrying charge and amortization charge must be added the various elements which go to make up the maintenance and operating costs that are clearly set up in the formula.

The second formula representing the cost of the old car is quite similar to the first with the exception that interest and carrying charges are eliminated on the assumption that the car cost is paid up. If this is not the case, then this value must be included. Also, adjustments must be applied to compensate for different seating capacities and schedule speed, and a factor must be added representing the added sales value of the new car. These corrections bring the costs of the two cars to a strictly comparable basis. The seating capacity ratio is applied to all operating and maintenance costs, while the schedule speed ratio is applied to platform expense only as this item may be reduced with the use of higher speed cars. In making these adjustments it must be remembered that full advantage cannot be taken of improved seating capacity and speed when only a single or relatively few cars are being considered. There must be a sufficient number of cars under consideration to equip a line, otherwise the schedule cannot be adjusted to take advantage of the new equipment.

The formulas are as follows:

$$X = \left[(a-u)\left(\frac{s}{2}+t\right)\right] + (b+c+f+g+j)$$

$$Y = \frac{(d+e)m}{n} + \frac{hmo}{np} + \frac{im}{n} + \frac{km}{n} + r$$

Where:

X = annual cost of proposed new-type car,
Y = annual cost of old-style car,
a = estimated cost of new car,
b = car maintenance cost of new car,
c = track maintenance cost of new car,
d = car maintenance cost of old car,
e = track maintenance cost of old car,
f = operating cost (platform expense) new car,
g = operating cost (carhouse expense) new car,
h = operating cost (platform expense) old car,
i = operating cost (carhouse expense) old car,
j = energy cost new car,
k = energy cost old car,
m = seating capacity of new car,
n = seating capacity of old car,
o = schedule speed of new car,
p = schedule speed of old car,
r = added annual value of new car over old in receipts due to increased ride sales value of new equipment, decreased accident probability, etc.,
s = interest rate on new capital,
t = amortization rate per year on new car,
u = scrap value of old car.

The following data will be found all that are necessary to work out the values for the preceding symbols in addition to the items indicated in the foregoing;

Weights of cars.
Car-miles per year.
Ton-miles per year.
Energy cost for propulsion per ton-mile.
Track maintenance per ton-mile.
Platform expense per car-mile.
Maintenance of equipment per car-mile.
Carhouse employees and expense per car-mile.

In these data car-miles are figured equal for the two cars under comparison and adustments are applied in the formulas to bring both types of car to an equivalent basis.

In estimating the track maintenance cost it is recommended that this figure be based upon the theory that one-third of the cost is in the nature of a fixed charge; that is, that natural effects of atmosphere, rain, freezing, etc., cause one-third of the expense, and that the remaining two-thirds fluctuates with ton-miles of car operation.

It will doubtless be of interest to know that in applying the above method of figuring to an actual case, the estimated saving per car per year if replaced by modern equipment was found to be more than $1,900. Surely this is worth while.

Entrance to station in front of the Paris Opera House. This is one of the busiest subway stations in the center of Paris

Paris Rapid Transit Lines to Be Extended

Permission has just been granted for extensions outside the old fortifications. Flat fare charged for any distance, but two classes of accommodations provided

By Walter Jackson

IN THE calendar year 1927, the Paris Metropolitan Subways (Chemin de Fer Metropolitain de Paris) carried 524,092,344 revenue passengers with 102,890,255 car-km. (63,791,958 car-miles). This represents a slight decrease in number of passengers carried and a slight increase in car-miles compared with 1926.

A flat fare of 1 franc (4 cents) is charged for first class accommodations and 0.60 franc (2.4 cents) for second-class accommodations. There is also a reduced fare for early riders, known as the workmen's round-trip ticket. The proportion of riders and revenue from the different classes during 1927 were as follows:

CLASSIFICATION OF RIDERS ON PARIS METROPOLITAN, 1927

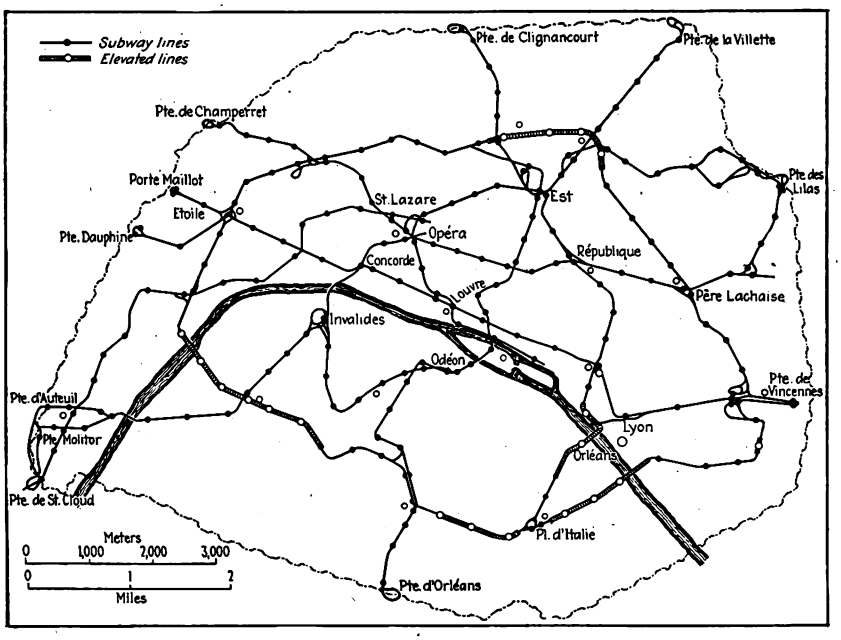
		Revenue
First class, one-way at 1 franc, per cent	10.98	16.26
Second class, one-way, 0.60 franc, per cent	59.43	52.78
Workmen's round-trip, first ride before 9 a.m., 0.70 franc, per cent	29.57	30.64
Miscellaneous	.02	.32
	100.00	100.00

As the first-class riders make up only about 11 per cent of the total, only one car in the standard train make-up of five cars is set aside for their use. This is the central car, and it is colored red to distinguish it from the others, which are colored green. In the standard five-car train, two cars at one end and one car at the other are motor cars, the other two cars are trailers.

The permissible passenger capacity of each type is stenciled in the cars and is as follows: First-class, 33 seated and 46 standing passengers; second-class, 26 seated and 78 standing passengers. In a standard five-car train there are consequently 104 second-class seats and 33 first-class seats against room for 312 second-class standing passengers and 46 first-class standing passengers. Thus, while the first-class riders constitute only 11 per cent of the traffic they have access to 24 per cent of the seats.

Confusion in loading two classes of riders is avoided by the installation of a special "first-class" sign which is hung over the platform at about the position where the first-class car will stop.

Digitized by Google



This map of Metropolitan Rapid Transit system in Paris shows clearly that the greater part of it is underground. It also illustrates the policy pursued in the past of stopping the lines at the city walls

As the first class riders get 20 per cent of the train capacity but yield only 16 per cent of the revenue, they are less profitable than the second-class riders, despite 66⅔ per cent more fare.

The cars are plentifully supplied with stanchions for the standees. A convenient feature of these stanchions is the attachment of parcel racks. This is made easier by the absence of advertising car cards. The city forbids all advertising inside and outside of subway cars. The nearest thing to an "outside" advertisement is a modest card announcing some public exposition.

Most trains are now served by three men, viz., motorman and guards in the first and last cars. The doors are closed by air, but may be unlatched by the passenger. Recent improvements make it impossible for the train to start before all doors are closed.

A couple of routes are still served by a fourth man whose duty it is to see that riders in the first-class car have first-class tickets. Plans are now under way to have one such inspector for every five trains.

Helping the Passenger About

Except for the absence of traffic posters, the Paris Metropolitan Underground shows the same assiduous attention to the passenger's needs as does the London Underground.

Outside the stations, in the lobbies and on the platform walls are posted enormous maps showing the layout of the routes, names of stations and on some maps, also the running times between the principal stations. A pocket-size edition of this map and running times is also available to the passenger.

On leaving the ticket window, the passenger cannot help seeing a "direction" placard. This shows the order of stations and also the "correspondences." The latter are the principal points which can be reached by transfer at various stations. A typical placard of this kind showing the stations in both directions appears on page 304.

Formerly the head end of a train carried lights as destination markers, but these have long since been superseded by definite names, like "St. Gervais," in an illuminated box. In addition, the passenger is forewarned of the destination of a coming train by illuminated boxes hung over the platforms.

Inside the car he will find skeletonized maps of the route on which he is traveling.

On leaving the station he is not left in doubt as to

One of the entrances to the subway station at the Place de la Concorde

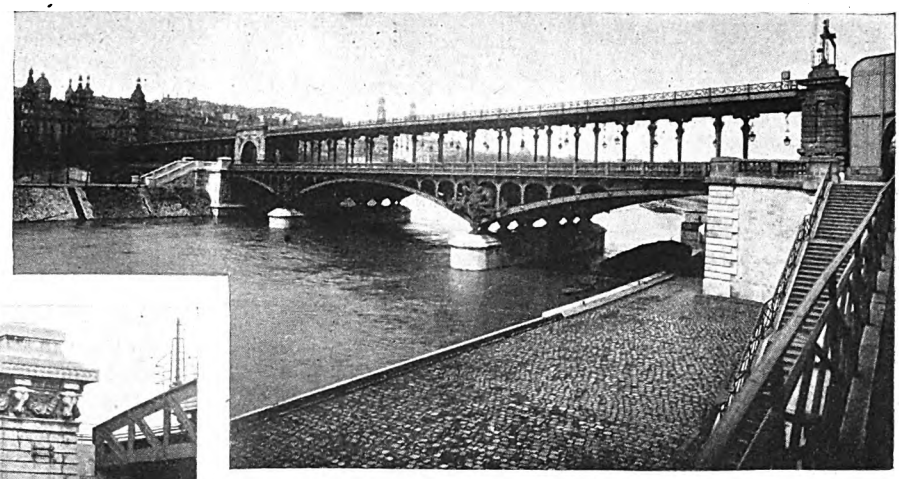
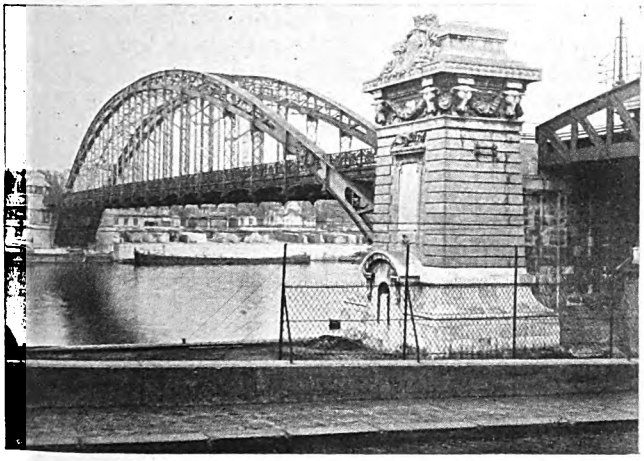
The Seine is crossed at a number of places, sometimes by tunnels and sometimes by bridges. At the points shown in these views the crossing is overhead.



Passy viaduct, with the railway on the upper level and the highway below



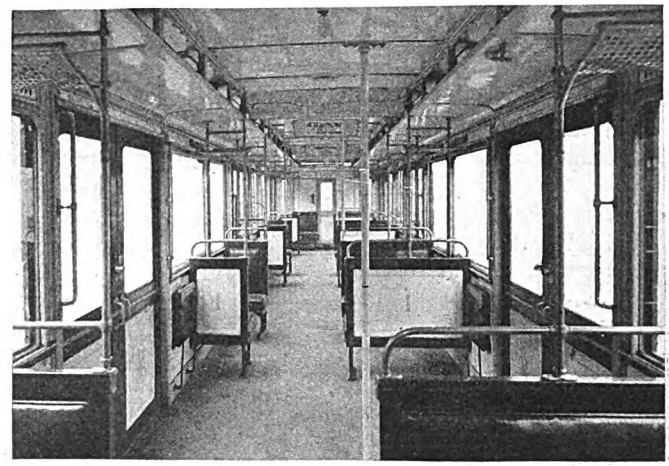
Austerlitz Bridge

which end is nearer his destination, if this destination happens to be an important traffic point. Signs at the ends of the platforms give him this information, and save considerable travel through surface congestion.

Gates have been installed to assure the minimum amount of conflicting movement in entering and leaving stations. They also avoid confusion to the stranger who might otherwise find himself traveling up side tunnels to transfer platforms, etc.

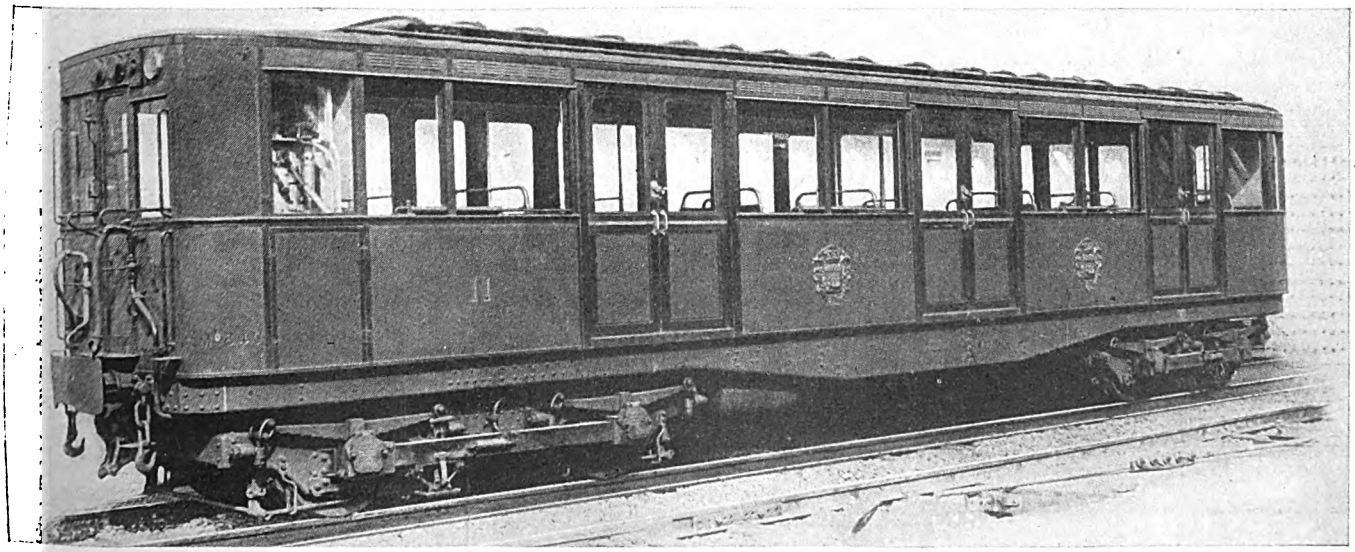
Weekday schedules are posted at all stations and show when train service begins and ends on different routes throughout the year (October to April and May to September). The last line of this placard says that Sunday and holiday schedules are varied according to public needs.

Care is taken to advise passengers of train delays.



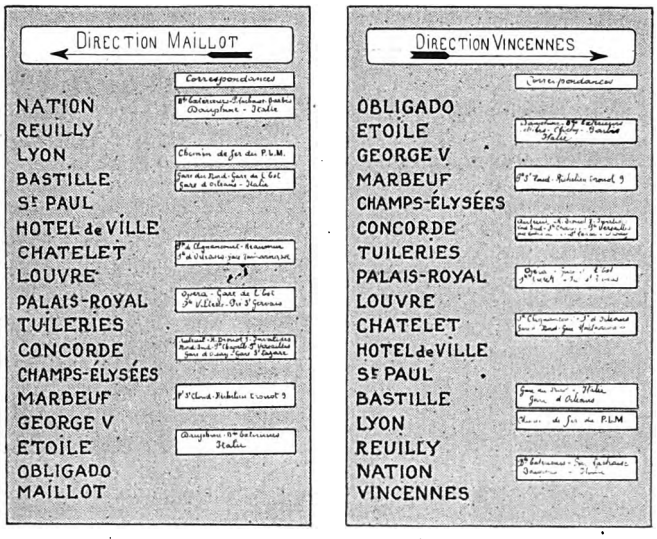
Interior of a first-class car. Even at the higher fare charged, a considerable percentage of the passengers are expected to stand during rush hours

Enameled signs of white letters on a blue field are used for the announcements of local routes, and white letters on a red field for news of delays on connecting lines. The owl rider is kept informed by notices of the passing times of first and last trains at his station.



Exterior of a Metropolitan second class motor car. Passenger entrance and exit are facilitated by three double-sliding doors on each side. Passengers are supposed to enter by the center door and leave by the side doors, but this rule is not always followed. A feature of the exterior finish of these cars is the use of vitreous enamel for the side plates

Digitized by Google



Large placques like this are displayed in each station to give the traveler the names of the stations in each direction and the principal points which can be reached by transfer from each station

A printed notice on the station walls also advises the public that complaints may be registered in a book at the station. A copy of each complaint must be forwarded to the Police Department, and the complaint must be answered within 30 days. Complaints number only five or six a day.

Extensions into the Suburbs Approved

A peculiar feature of the Paris system is that it was laid out wholly within the old city walls, which have now been changed to a broad, continuous boulevard encircling the city. The termination of the rapid transit lines at this boundary is shown clearly by the map and also by the fact that practically all line terminals are at "Portes," otherwise, gates, in the old city walls. Therefore, the Paris rapid transit system has never been able to carry the public into the suburbs as do rapid transit systems in other cities. This service has had to be left to suburban trolley connections of the city subway, bus and car routes or to the steam lines now partially electrified. Thus the State Railways (État) electrification was extended to Versailles, 18 km. (11.2 miles) from Paris on July 22, 1928.

Only recently, in fact, not until July, 1928, did the Department of the Seine agree to permit rapid transit extensions beyond the original ramparts. The aggregate length of the proposed Metropolitan extensions is 7 km. (4.4 miles). The city also approved a Nord-Sud extension toward Issy for 2 to 15 km. (1.2 to 8.1 miles) with a possible continuation to Versailles. Negotiations are also in hand to electrify the 15 km. (9.3 miles) line of the Paris-Orleans Railway to Sceaux and to electrify a second shorter portion along the Boulevard St. Michel as part of the city subway system.

In 1927, the Metropolitan operated 94.8 km. (58.8 miles), and 17.5 km. (10.0 miles) more were under construction by the city of Paris. This makes a total of 112.3 km. (69.6 miles) out of a franchise for 123 km. (76.3 miles).

In addition to this company, there is a second rapid transit company in Paris, known as the Nord-Sud. The two systems transfer between each other without charge, so that the passenger hardly knows where one begins and the other ends. It extends in a general north and south direction through the center of the city without directly paralleling any of the Metropolitan lines. During 1927, the Nord-Sud Company, as in past years, did one-fifth as much business at the "Metro."

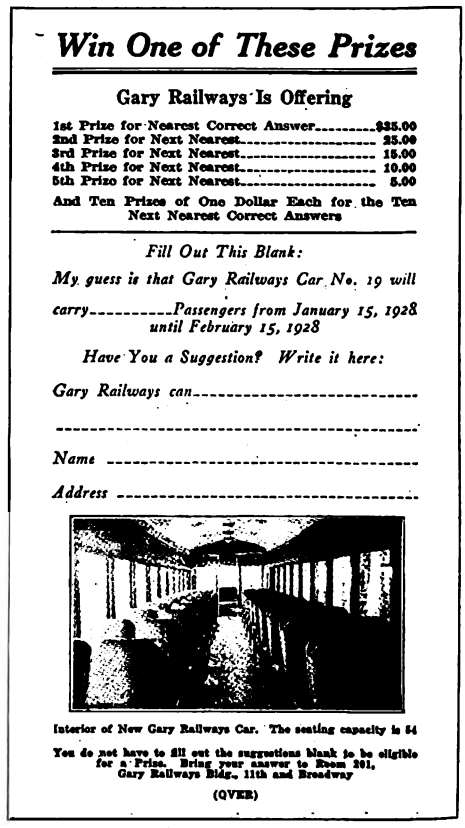
By agreement with the city of Paris, both properties will be combined in 1931.

Gary Contest Car Arouses Interest

"HOW many passengers will this car carry in a month?" was the question borne by one of the cars of the Gary Railways, Gary, Ind., during a recent contest which gave much publicity to the company. The car, which was operated on all lines of the system during the 30-day period, is one of the new ones of the company. It has individual seats, leather upholstered. The contest was intended to stimulate interest in the new car and to secure from the patrons constructive suggestions for improving the service.

Cards, given to patrons boarding the car, explained the contest in detail and provided space for entering the patrons' guesses and suggestions. No mail answers were given consideration, the contestants being required to bring their filled-in cards to the company's office to be eligible for the prizes, totaling $100. Of 60,000 cards distributed, more than 6,000 were returned. Many helpful suggestions were made on the blanks and the company received much valuable publicity.

The car selected for the contest was operated on all lines of the system during the 30-day period



Win One of These Prizes

Gary Railways Is Offering

1st Prize for Nearest Correct Answer.....$25.00
2nd Prize for Next Nearest..... 25.00
3rd Prize for Next Nearest..... 15.00
4th Prize for Next Nearest..... 10.00
5th Prize for Next Nearest..... 5.00

And Ten Prizes of One Dollar Each for the Ten Next Nearest Correct Answers

Fill Out This Blank:

My guess is that Gary Railways Car No. 19 will carry.....Passengers from January 15, 1928 until February 15, 1928

Have You a Suggestion? Write it here:

Gary Railways can.....

Name .....

Address .....

Interior of New Gary Railways Car. The seating capacity is 54

You do not have to fill out the suggestions blank to be eligible for a Prize. Bring your answer to Room 201, Gary Railways Bldg., 11th and Broadway

(OVER)

Cards for the contest provided space for suggestions and described the new cars

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK STANDARDS—21

Central Electric Railway Association

Code of Rules*

GOVERNING THE CONDITION AND REPAIR OF FREIGHT CARS FOR THE INTERCHANGE OF TRAFFIC

Adopted by the Central Electric Railway Master Mechanics Association

These rules are formulated as a guide to the fair and proper adjustment of all questions arising between car owner and handling company with the intent of:

1. Making car owners responsible for and, therefore, chargeable with, the repairs to their cars necessitated by ordinary wear and tear in fair service and by the safety requirements of the United States safety appliance standards as applied to electric railways, and by the standards of the Central Electric Railway Master Mechanics Association.
2. Placing responsibility and providing a means of settlement for damage to any car occurring through unfair usage or improper protection by the handling company.
3. Providing an equitable basis for charging such repairs and damage.
4. Inspection of freight cars for interchange and a uniform system on which acceptance or rejection of cars offered in interchange are based.

Care of Foreign Freight Cars

Rule 1. Each railroad is responsible for the condition of all cars on its line, and must give to all equal care in handling and inspection.

Rule 2. Cars having defects for which delivering company is responsible must be properly carded when offered in interchange, as per Form 1.

EFFECTIVE JANUARY 1, 1928

Empty cars offered in interchange must be accepted if in safe condition and serviceable for some commodity that can be loaded in the car, the receiving road to be the judge.

Owners must receive their own cars,

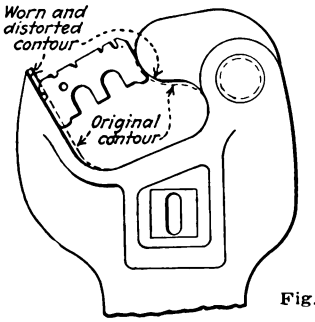

Fig. 1

when offered home for repairs at any point on their line, subject to the provisions of these rules.

Empty cars furnished on orders for specific lading must be in serviceable condition for such lading, the receiving road to be the judge. If not acceptable they must be carded with return card C.E.R.M.M.A.—Form 2.

Rule 3. Loaded cars offered in interchange must be accepted when in safe operating condition and when meeting the allowable clearances and permissible weight as determined by track, bridges and structures, with the following exceptions:

(*a*) Cars (whether loaded or empty) having defects in violation of the Safety Appliance Acts, will not be accepted in interchange.

(*b*) Cars loaded with explosives must be handled in accordance with regulations of the Interstate Commerce Commission. Cars containing inflammable liquid which is leaking must be repaired or transferred without any unnecessary movement or at nearest available point.

(*c*) Cars improperly loaded when transfer or rearrangement of lading is necessary.

(*d*) Lading of open cars when dimensions of lading are in excess of clearances of roads over which the shipment is destined. the receiving road to be the judge.

(*e*) When cars can not pass third rail or overhead clearances for electrical conductors.

(Continued on Data Sheet No. 22)

*Supersede rules and uniform charges published in Maintenance Data Sheets, Rolling Stock Standards 3 to 10 and 13 to 20 inclusive.

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK STANDARDS—23

C.E.R.A. Code of Rules (Continued from Data Sheet No. 22)

nated on defect, billing repair or joint evidence cards for other parts of cars, the same uniform order of location shall govern.

Rule 12. Cars must be maintained within the limits of standard height for couplers, measured from top of rail to center line of coupler head. As far as possible, cars should be adjusted when empty. When construction of car and trucks precludes the common methods of adjusting coupler heights, the application of metal shims between journal boxes and arch bars will be permissible. The use of liners between male and female portions of center plates is prohibited where the vertical bearing surfaces are reduced. The limits of height from top of rail to center of couplers shall not be less than 31½ in. and not more than 34½ in. under any condition of loading. When bill is rendered the height of car before and after altering must be shown in billing repair card C.E.R.M.M.A.—Form 4.

Rule 13. Bills may be rendered against car owners for applying temporary transverse tie rods to cars with sides spread or bulged beyond the clearance limits of the handling line.

Rule 14. Couplers that exceed the distance of 5½ in. between point of knuckle and guard arm, measured perpendicularly to guard arm, must have the defective part or parts renewed to bring coupler within gage, in which case owner is responsible (see accompanying Fig. 1). When couplers of another make are applied to a car, the uncoupling arrangement shall be made operative at expense of the company making repairs. But in no case shall such changes be made that will destroy the original design providing the owner wishes to change again to meet their standard.

Locking device must come within 2 in. of knuckles. Anchor must not be loose and no anchor bolts missing. No cracks or defects on knuckles or drawbars or anchors are permitted.

Rule 15. *Wheels.* (*a*) Tread thickness measured 1 in. from edge of rim shall not be less than ¾ in. (*b*) No wheels must have over ⅛ in. hollow tread. (*c*) Flanges not less than 1⅛ in. thick. (*d*) Treads not to be over 3⅛ in. wide or under 3 in. at any point. (*e*) Must not have chipped flanges more than ¾ in. wide x 1½ in. long. (*f*) Steel wheels must not have a flat spot over 2 in. long and cast iron wheels must not have a flat spot over 1 in. long. (*g*) Wheels must not be less than 54 in. inside measurement at gage line.

Rule 16—*Brakes.* (*a*) Not less than 6 in. or more than 8 in. piston travel under load. (*b*) Heads, beams, pins, rods, hangers, etc., must be in good repair. (*c*) Hand brake must be efficient and in good repair.

Rule 17—*Trucks.* (*a*) Side bearings to have at least 1/16 in. clearance under load. (*b*) Center bearings must be O. K. and well lubricated.

Rule 18—*Axles.* (*a*) The total weight of car and its lading must not exceed weight given in column "A." Column "B" is the nominal capacity stenciled on all cars. Axles must be removed from service when less than the prescribed limits in columns "C," "D," "E," in table of C.E.R.M.M.A. standard axles or when the condemning limits in columns "F" and "H" are reached.

(*b*) Standard A.E.R.E.A., axles must be used in replacing A.E.R.E.A. standard axles, subject to the condemning limits for such axles.

(*c*) When second hand axles are applied, the diameter of wheel seats and centers must not be less than the limiting dimensions shown, and the diameter of the journals must be at least ⅛ in. greater than the limiting dimensions. The length of journals must not exceed ⅜ in. over standard length, the collar must not be less than 1/16 in. thick and the fillet at back end of journals on axles of 40,000 lb. capacity cars must not be less than ½ in. radius, axles of 50,000 and 60,000 lb. capacity cars not less than 1/16 in. radius, nor less than ⅜ in. radius on axles of greater capacity.

(*d*) No welding of axles is permissible except at the button which may be built up.

Rule 19—No cast iron wheels will be accepted in interchange after Jan. 1, 1930.

Rule 20—All coupling hose must be 1⅜ in. x 18 in. with F.P.5 coupling and all flexible drawbar hose must be 1⅜ in. Other sizes will not be accepted in interchange after Jan. 1, 1930.

Rule 21—*Journal.* (See accompanying sketch.) Application of packing (*a*) Inner —In packing a journal box, twist somewhat tightly a rope of packing and place it in the extreme back part of the box, as shown at "A" in the accompanying Fig 3. Make sure that it is well up against the journal so as properly to lubricate the fillet on the journal and keep out the dust.

(*b*) Main—Apply sufficient packing (preferably in one piece) to fill the space shown at "B in Fig. 3." Take care to have this packing bear evenly along full length of the lower half of the journal. The packing should not be too tight but should be tight enough to overcome any tendency to settle away from the journal. The pack-

ROLLING STOCK STANDARDS—22

C.E.R.A. Code of Rules (Continued from Data Sheet No. 21)

(*f*) Where roads require radial M.C.B. couplers, the rigid type will not be accepted in interchange.

Rule 4. The following defects must be repaired by receiving line while car is under load:

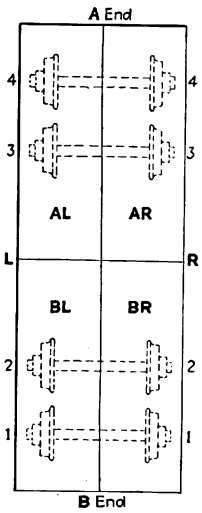

Fig. 2

(*a*) Journals are to be lubricated or repacked when necessary; when bearings are required, the same kind are to be used when possible.

(*b*) All brake rods, levers, pins, brake beams and brake shoes.

(*c*) All air hose, cocks, valves and piping.

(*d*) Couplers, worn and distorted knuckles, chains and levers used for coupling and uncoupling.

(*e*) Temporary repairs to roof when condition of same endangers lading and when such repair does not exceed 25 per cent of the roof covering.

(*f*) Missing or defective side or end doors when same endangers lading from weather or theft.

Rule 5. A bad order foreign car delivered under load, if load is transferred or unloaded within switching district, may be returned to delivering line properly side-carded on both sides showing the defects for which the car was transferred or returned, in which case it must be accepted unless the receiving line has a direct physical connection with the car owner at that point, car to be carded as per C.E.R.M.M.A.—Form 3.

Rule 6. In rejecting cars because of defects in violation of rule 3, all of the defects objected to must be designated with ink or black indelible pencil on return cards C.E.R.M.M.A.—Form 2 and placed on both sides of car.

Rule 7. No car will be accepted in interchange unless properly equipped with United States safety appliance standards as applied to electric railways.

Rule 8. If a foreign car has defects, the receiving line shall require that a defect card be securely attached to the car, as per rule 2. Defect card shall not be required for any slight damage (new or old), that of itself does not require repairs before reloading of car. Defect cards shall not be required for raked or cornered sheathing, roof canvas, bent or cornered end sill if defects are old.

At points where joint inspection is not in effect, the matter will be left to the judgment of the receiving line. Where joint interchange inspectors are employed, the decision will be made by them.

Rule 9. All cards must be of the form specified in these rules and must plainly specify each item, indicating location of defects, as provided in these rules.

Rule 10. Any car having defects which render it unsafe to run, unsafe to trainmen or any lading suitable to car, must

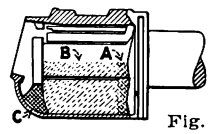

Fig. 3.

be repaired and be made safe to return to owner, billing repair card C.E.R.M.M.A.—Form 4 to be used.

Rule 11. The end of the car toward which the cylinder push rod travels shall be known as —*B*— end and the opposite end shall be known as —*A*— end. Facing —*B*— end of car, in their order on the right side of car, wheels, journal boxes and contained parts, shall be known as R1, R2, R3, R4, and similarly those on the left side of car shall be known as L1, L2, L3, L4. The same order of numbers shall be used for designating corresponding location of brake beams. In any case where right or left side is desig-

ROLLING STOCK STANDARDS—24

C.E.R.A. Code of Rules (Continued from Data Sheet No. 23)

ing should extend to approximately the center line of the journal but not above at any point, and should be pressed down evenly at sides that no loose ends may work up under the journal bearings.

(*c*) Outer—Apply a third piece of firmly twisted packing as shown at "C," and pack tightly in order to prevent displacement of the main packing. There should be no loose ends hanging out of the box as they would tend to draw out the oil.

*(*d*) Periodic repacking of journal boxes, after the expiration of twelve months, as indicated by the stenciling on car, regardless of the responsibility of handling company for change of wheels or other repairs.

*(*e*) All journal boxes shall be jacked; all journal wedges and bearings removed for examination, and renewed where necessary; all boxes cleaned and repacked with properly prepared packing (new or renovated) in accordance with C.E.R.M.M.A. recommended practice, and car stenciled. Dust guards shall be renewed, when necessary, only where wheels or journal boxes are changed.

*(*f*) The place (railroad and station), month, day and year of repacking shall be stenciled on car body near the body bolster at diagonal corners with not less than 1 in. figures and letters, using the same station initial as is used for air-brake stencil. This provision also applies to new cars.

*(*g*) No change shall be made in the stenciling unless all boxes are repacked and the work complete, in all details, has been performed.

*(*h*) If car bears no stenciling showing date of previous repacking, all boxes may, if necessary, be repacked in accordance with paragraphs (e) and (f).

*(*i*) This work shall be done only when cars are on repair track for other repairs.

*(*j*) No charge shall be made for repacking, etc., if performed within twelve months from date stenciled on car.

*(*k*) No charge shall be made for repacking, etc., unless all boxes are repacked and the work complete, in all details, has been performed.

*(*l*) Work performed, in accordance with the foregoing, may be charged to car owner at prices specified in Rules.....

*(*m*) Journal bearings having back or lug broken or cracked, or length reduced ⅜ in. or more, or lining loose, cracked, broken, spread over side or worn through to brass, shall be considered as requiring renewal.

*(*n*) Journal bearings wedges cracked, broken, or top radius worn flat lengthwise of wedge, shall be considered as requiring renewal. Care must be taken to see that wedges are not scrapped for wear unless top radius is actually worn flat.

*(*o*) The periodic repacking, etc., does not contemplate any change in the ordinary attention as to oiling and packing when necessary.

*(*p*) At time of periodic repacking inspection must be made of all axles for defects and limits of wear. If defects are found axles should be changed or owner notified on Form C.E.R.M.M.A.-1.

Rule 22. In no case shall car owner be charged for the second or subsequent applications of journal bearings if applied within 30 days from initial application at the same journal location on same road, except when renewed within such period account change of wheels or axle at same journal location, in case the application of wheels is chargeable to the owner.

Rule 23. Companies shall promptly furnish to each other, upon requisition, and forward, freight or express charges collect from point of shipment, material for repairs of their cars on foreign lines. If material is for repairs of car owner's defects, the foreign company may bill car owner for the entire freight charges, and in such case the car owner may reclaim freight charges for that portion of the movement over its own lines. If the material is for repairs of user's defects, the foreign line may reclaim only for that portion of the movement over its line.

A separate bill, with copy of freight, express or due bill attached, should be rendered for the freight or express charges showing reference to bill covering repairs.

Requisitions for such material shall specify that same is for repairs of car, giving car number and initial of such car, together with pattern number, sketch or other data to enable correct filling of requisition.

Rule 24. Repairs to foreign cars shall be promptly made, and the work shall conform in detail to the original construction, and with the quality of material originally used.

Rule 25. Any foreign road making partial or full repairs of defects on a car which is covered by a defect card, will have the defects repaired, crossed off the original card with ink or indelible pencil and card replaced on car. A copy of the card so marked should accompany the bill.

Rule 26. When repairs are made to a foreign car, card C.E.R.M.M.A.—Form 4

shall be used embodying the required information and reason why such repairs were required. Heads of mechanical departments will exchange memorandums in duplicate of labor and material charge plus 15 per cent applied to foreign cars during month for the purpose of having same approved so billing can be made by auditing department.

Rule 27. When repairs are made to a foreign car for which a bill will be rendered, immediately upon completion of such work a notice must be sent to the owner or C.E.R.M.M.A.—Form 4.

Rule 28. Defect cards and joint evidence cards must be securely attached to both sides of car with at least four tacks.

Rule 29. No labor to be charged for the inspection of cars, testing or adjusting brakes, adjusting angle cocks, tightening unions, bolts, bolt nuts, lag screws or spreading cotters, sill steps, and hand bolts or straightening on car, brake shafts, uncoupling levers or carrier irons when not removed from car.

Rule 30. On the first of each month, the operator will promptly forward to the owner a statement of the individual mileage operated by such owner's cars, for its information in connection with maintaining mileage records of cars and equipment of cars.

Rule 31. Delivering company is responsible for any of the following when happening on their line:

(*a*) Removing or cutting out parts of car so as to facilitate loading or unloading.

(*b*) Known theft of parts of car occurring on its lines.

(*c*) Damage to any car if caused by: (1) Derailment; (2) cornering; (3) sidewiping; (4) collision; (5) colliding with or shoving over bumping posts or other fixed obstructions; (6) overloading; (7) collapsing buildings or other structures on right of way; (8) unconcealed fire damage; (9) failure to close hoppers or drop doors before moving car; (10) improper coupling of cars; (11) improper coupling of cars at excessive speed; (12) unfair usage of equipment.

Rule 32. Damages to foreign car for which the delivering company is responsible should be repaired at once unless such damaged car is under load and can proceed to destination in conformity to rules as herein prescribed. The company responsible for the damage shall at once notify the owner and arrange how or by whom the repairs shall be made.

Rule 33. When a car having damage for which delivering line is responsible is found with other defects which are ordinarily the owner's responsibility and are not associated with delivering line defects, such fair usage defects may be repaired at car owner's expense. Reported on billing repair card Form 4.

Rule 34. When a foreign car is destroyed or badly damaged, the owner shall upon request, furnish depreciated reproduction value of car complete, and the company responsible shall have the option of repairing or settling under the depreciated reproduction value. Depreciations to be figured from the date that the car was built or if built or acquired prior to when the road came under the acts of the Interstate Commerce Commission, its value as there fixed should be used to figure from.

Rule 35. For the mutual advantage of railway companies interested, the settlement for a car owned or controlled by a railway company, when damaged or destroyed upon a private track, shall be assumed by the railway company delivering the car upon such tracks.

When a car owned or controlled by a railway company is damaged or destroyed on the tracks of a road which is not a member of the per diem rules agreement of the Central Electric Railway Association or not a subscriber to these rules, the road responsible for the per diem while in the possession of the non-subscriber shall be responsible to the owner for damages to or for the destruction of the car.

Rule 36. If the company on whose lines the car is destroyed elects to rebuild the car, the original plan of construction must be followed, and the original kind and quality of material used. No allowance shall be made for betterments not authorized by car owner.

Rule 37. When a foreign car requires general repairs such as wheels, truck frames, bolsters, broken axles, etc., for which the owner is responsible and its condition will not permit its return home, it shall be inspected by the handling line and an inspection certificate made, using Form 5 (except the joint inspection will not be necessary) covering all defects found on car, and estimated cost of repairs, total labor and total material separately.

The inspection certificate shall be forwarded promptly to car owner together with list of material required to be furnished by the owner, with shipping directions. The car owner shall promptly in-

spect, if he so desires. If plans or specifications are required they shall also be requested. Standard safety appliances as applying to electric railways must be completely applied.

Rule 38. Bills for repairs made under these rules and for material and labor furnished shall be in conformity with schedule of prices for the articles enumerated plus 15 per cent. Bills shall not be rendered for less than $1 but charges for a less sum than $1 may be held till they amount to that sum.

"Rule 39. In case of all parts returned to owner memo giving car number and initial and date removed must be attached to a copy of freight bill sent to owner. If not otherwise arranged for, parts will be shipped charges collect.

Rule 40. Triple valves (H-1 and H-2) to be replaced at price of new valve and defective valve returned to owner. Replaced valve may be returned to line installing same and full credit for valve allowed. Angle cocks, cutout cocks, release valves, pressure retaining valves to be replaced at the new price and defective parts returned to owner at end of calendar month.

No other credit for scrap material will be allowed as same has been deducted in prices shown herein.

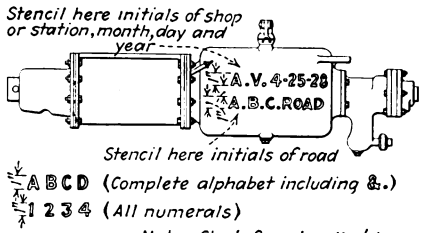

Fig. 4

If the location of marks do not present a clear view from outside of car, the stenciling must be located near handle of release rod on the reservoir side of the car.

Rule 41. Cylinders and triple valves, not cleaned within the last twelve months as shown by the standard markings. These markings are also required on new cars.

After the expiration of nine months, if car is on repair track for other repairs, the air brakes may be cleaned at same time. After the expiration of eleven months, the air brakes may be cleaned irrespective of whether car requires other repairs. Centrifugal dirt collectors should be cleaned when requiring such attention regardless of date of last air brake cleaning.

Charge is not permissible for cleaning triple valve or cylinder unless the triple valve, cylinder and centrifugal dirt collector are all cleaned at the same time. If car is not equipped with centrifugal dirt collector, original record and billing repair card must so state.

Triple valves to be cleaned must be removed from car and tested in accordance with C.E.R.M.M.A. Standard code of tests for repaired triple valves.

Association Activities

Making Service More Attractive Is Concern of Wisconsin Transportation Men

EVERY electric railway property of Wisconsin, as well as most of the motor bus operators, was represented at the seventh annual meeting of the Transportation Section of the Wisconsin Utilities Association in Sheboygan last week. The convention was the largest attended of any to date, 98 registering during the two days of the meeting. Nine excellent papers, a wealth of good discussion, and an address at the closing luncheon by Lucius S. Storrs, managing director American Electric Railway Association, were high lights of the occasion.

"No community larger than a village can prosper or be an attractive place in which to live except it have a reliable public transportation service," Mr. Storrs declared with emphasis. An abstract of his address appears elsewhere in this issue.

The convention was presided over by J. H. Lucas of the Milwaukee Electric Railway & Light Company, who in a brief address stressed the fact that in every department of the transportation business there has been definite progress, both physical and mental. "Methods have been perfected for doing what was thought to be impossible a few years ago," said Mr. Lucas. "Our cars, for example, are considerably different from what they were a short time ago. The bus, the newest entry into the transportation field, has itself undergone a development so complete and so rapid that it is difficult to keep pace with it. Track and line have likewise changed so much as to alter the entire outlook of the engineers. Transportation department methods have changed no less radically. If," concluded Mr. Lucas, "we hold to high standards, do a good job, and build a reputation for service, we need have no fear for the recognition of the effort put forth."

Mayor Herman Schuelke of Sheboygan welcomed the convention, complimenting the railway men for the attention and study they are giving the problems of public transportation. C. R. Phenicie, president Wisconsin Utilities Association, responded to the Mayor.

The need of standardizing highway crossing protection was explained by L. P. Atwood, railway operating engineer of the Railroad Commission of Wisconsin. "For some time," said Mr. Atwood, "I have classified devices used at highway crossings with railroad tracks as of either a 'caution' or 'protective' type. Those of you who are railroad men will understand that a caution device may be compared with both 'caution' and 'stop and proceed' signals on the railroad, while a protective device corresponds to 'stop and stay' signals in railroad operation. In other words the caution device, sign or signal denotes only the presence of railroad tracks, and requires the highway traveler to ascertain for himself whether a train be approaching. The protective device, on the other hand, advises or warns the traveler when a train is actually approaching the crossing." After defining the various types and combinations of types of highway signals Mr. Atwood proceeded, "the uniformity in protective devices for highway crossings in a state need not necessarily be by legislation, but perhaps rather by general consent and custom on the part of the railroads, municipal authorities, and the state railroad commission. That is the manner in which such standardizing and uniformity is being developed in Wisconsin. We need the standardizing of highway crossing protection in order that the highway traveler may obtain uniformly distinctive warning, quickly observed and realized, that he is approaching railroad tracks, and must depend upon his own observations before reaching it to determine whether a train is coming. There should be these two distinctive types of warning and the devices, signs or signals giving these warnings should be as nearly uniform as may be, and distinctive from all other highway markings."

Results of three years' research study by electric railway fellowship students at the University of Wisconsin on the elimination of noises from street car operations were recapitulated by Silas B. Tobey, fellowship student of the past year, as follows:

"The modern street, the concrete one, is the noisiest, if it does not have some noise eliminators with it.

"The thermit joint will greatly reduce the noise ordinarily produced by the street cars.

"The cushioned mechanical tie is as quiet, if not more quiet, than the wood tie.

"Rail filler reduces the noise of the street car by absorbing it from the rails to a considerable extent.

"The more and the softer the seats in the car, the less will be the sound intensity in it.

"If there is insulation between the inside and the outside walls of the car much of the truck noise will be kept out.

"Finally, the point which is clear to so many, yet considered so lightly by some; that is, careful maintenance of all parts of the car, including the wheels, will bear much emphasis."

In his paper on the use of concrete in the track zone pavement, F. G. Hibbard of the Milwaukee Electric Railway & Light Company described in some detail the methods and equipment used in the handling of such work in Milwaukee. Lantern slides and moving pictures accompanied the presentation of the paper.

Of particular interest to the transportation men was the paper and demonstration of Walter J. McCarter, supervisor of training the Milwaukee Electric Railway & Light Company. Mr. McCarter outlined the methods of employee selection used by his company, and by means of a specially constructed portable test set, illustrated the psychological examination through which applicants for the positions of trainmen in Milwaukee are put. Said Mr. McCarter, "No one can predict what a man will do under a set of circumstances until that set of circumstances has been placed before him. Because of these fundamental differences in all human beings, if we are going to know each man's ability, these abilities must be tested. Testing, whether it be of a machine or of a man, is a sampling of

abilities. In our transportation work we cannot test the ability of a 'green' man to run a street car, but we can test his ability to learn to run it and to properly react to given situations."

The report of the accident prevention and insurance committee was presented by J. W. Oliver of the Chicago, North Shore & Milwaukee Railroad. The report consisted of information on safety work being carried on in organized fashion by four of the larger electric railways in the state. The accident prevention methods of the smaller properties are modeled along similar lines.

"Co-ordination of Transportation in Cities of 50,000 Population" was the subject of an address by L. P. Fessenden, district manager Wisconsin Power & Light Company, Sheboygan. While discussing the situation locally in particular, Mr. Fessenden said, "We realize that in order to get additional business, our schedules must be maintained, cars and coaches kept clean and attractive, and the public treated with the courtesy which they have the right to expect. To insure the latter, our employees are picked with care, are schooled on what constitutes politeness to our patrons, and are watched for lapses which through carelessness might occur."

A discussion of transportation problems in general was led by Nels C. Rasmussen of the Wisconsin Valley Electric Company, Wausau, and Clyde L. Hedges, Mississippi Valley Public Service Company, LaCrosse, as an after-luncheon program on the first day.

Operating results of the light-weight city railway car of the Chicago & Joliet Electric Railway, which was exhibited at the 1927 convention of the American Electric Railway Association in Cleveland, were discussed at some length in a paper by A. W. Baumgarten, division engineer of the company. This car was put through a series of special tests during last November and December in order to determine accurately its general operating characteristics. Since Feb. 1 the car has been in regular city service and a brief review of the service results to date were included in Mr. Baumgarten's report.

"Air Brake Installation and Maintenance" was the subject of a paper by Kenneth M. Wilkins of the Chicago, North Shore & Milwaukee Railroad. Following a review of the history of the development of retarding devices for vehicles, Mr. Wilkins took up in detail the approved methods of installation, inspection, and overhauling of modern air brakes. Concluding, Mr. Wilkins emphasized that with the frequent service of today, using heavy equipment with speeds varying from low to high over short distances, railways must have a brake that is durable, flexible, and always instantly responsive. To obtain these features, he pointed out, railway men should become thoroughly acquainted with the modern braking equipment and the means of handling it to the best advantage.

Recent developments in motors and car equipments were discussed by R. A. Hutchins, General Electric Company. Lantern slides were used to illustrate the newest types of resistors, controller fingers, motor-generator sets, modified automotive type drive for street cars, and details of new methods of ventilating heavy duty railway motors.

A paper "Therapeutics of Railway Equipment" discussing in a semi-facetious manner various ailments to which street railway cars are sometimes subject, and the general methods of treatment to be employed in curing them, was presented by John S. Dean, renewal parts engineer Westinghouse Electric & Manufacturing Company, and brought vociferous applause from an appreciative audience. To quote Mr. Dean, "Railway equipment is subject to many chronic ills and painful disorders which must be properly diagnosed and scientifically treated by the Maintenance Doctor (M.D.) who is commonly known as the master mechanic.

"The traveling public appreciate this condition, as it is apparent in many cities that some cars as they come rambling down the streets seem to be afflicted with rickets or locomotor ataxia and in the advanced stages of the yellow jaundice.

"The various diseases affecting railway equipment are discussed from a medico-mechanical viewpoint to help properly diagnose and remedy the disorders. This information should help the master mechanic to apply the proper counter-irritants, innoculate the patient with the correct anti-toxins or vaccines to give immediate relief and insure a speedy convalescence."

The annual banquet of the Transportation Section was held at Siebkins' Hotel, Elkhart Lake, near Sheboygan, on Thursday evening, with B. W. Arnold, in charge of motor bus transportation of the Chicago, North Shore & Milwaukee Railroad, as master of ceremonies. In addition to short talks by many of the "headliners" in attendance at the convention, Madame Elsa Behlert Bauer, former Berlin grand opera singer, sang several selections that were received with applause.

Henry Cordell of the Chicago, North Shore & Milwaukee Railroad was elected to succeed J. H. Lucas of Milwaukee as chairman of the Transportation Section for the forthcoming year. The place of the next meeting is expected to be Green Bay, the home of George Biebel, superintendent of railways Wisconsin Public Service Corporation, who was elected vice-chairman.

An Every-Day-in-the-Year Service*

By Lucius S. Storrs
Managing Director American Electric Railway Association

THE time can never come when the city dweller can always depend upon his own private vehicle to supply him with all the transportation he and his family and guests may need. Therefore, public necessity and convenience require a transportation service available to everybody every day in the year; without such a service the public is seriously handicapped.

In these days of rapid transportation, when the steam railroads are preparing to use the airplane as a supplementary vehicle in super rapid transcontinental service, when air mail is commonly used, when automobiles fill our highways and block our streets, when "pep" and speed seem to dominate men's minds, it is understandable that people who have not given the subject as careful study as we have given it should reach some false conclusions relative to local transportation in the future.

To some of these people it seems as if the days of usefulness of the electric street car were nearing an end. They point to the 25,000,000 passenger automobiles operating in the United States, the thousands of buses giving service, and declare that even these shall pass away and the air "flivver" or "air bus" will take their place. To such people we can only say that they reckon without understanding. Mass transportation is a science of itself.

Enthusiasm is a large factor in developing false conclusions. The inventor of a device or the discoverer of a new principle sees it revolutionizing the world. He sees it relegating to oblivion tried and true tools, methods, systems, ideas and policies. Yet as time goes on humanity finds not only a place for the new idea or invention, but also finds that it must continue to use the very thing the new idea was supposed to supersede.

Radio has not supplanted the cable and telegraph. Automobiles have not exterminated the horse. Oil has not replaced coal, aluminum has not taken the place of steel, chromium has not made obsolete the nickel plating industry. Experience has proved that the electric street car in mass transportation is as necessary to day as it was ten years ago. Private transportation has reached the maximum of convenient use in daily urban service. The bus has been adopted as a valuable auxiliary vehicle by the railways, and public policy in most places is against permitting competitive bus operations which would hamper established transportation companies in giving their necessary public service.

It is the public realization of the need of dependable transportation service that is the best insurance the public transportation industry can have. Some such service is absolutely necessary to every community larger than a village. The kind of service to be rendered will be determined by the characteristics of the communities. If a taxi-cab service is all that is necessary, then a taxi-cab

*Abstract of a paper presented at the meeting of the Transportation Section of the Wisconsin Utilities Association, Sheboygan, Wis., Aug. 16-17, 1928.

Digitized by Google

service is all that will be given. If a bus service is sufficient, then buses will render the service. If electric railways give the most efficient and economical service, then electric railways will continue to serve the communities.

Some of you men who are operating in Wisconsin have been surprised that street railways operating in larger communities than your own have not earned so much net income as your companies. The reason for this is to be found in the different conditions obtaining in the different communities. One town is a "good" railway town, another may not be so good. Much depends on the topography of the territory served, the habits of the people and the enterprises carried on in the communities. The wise transportation man will make a careful survey of the needs of his community from the standpoint of present-day conditions and will try to fill them most satisfactorily to the public.

There have been many instances of communities, faced with the loss of electric railway service, refusing to accept a substitute. I know electric railway operators who substituted buses for rail operations in small towns and later on wished they had not. I also know of communities, where, in my judgment, the public would be better served and the company would save money were buses to be operated rather than street cars. I know of communities that have not yet learned that the public interest and that of the transportation company are one and the same.

The need for public transportation is not going to decrease as time goes on. It will become greater. But we must see to it that the particular type of service that is most desirable is offered and then insist upon ample compensation. The skill with which the operating men are conducting the electric railways is little short of marvelous. The economies that have been effected have been tremendous. The opportunities for future savings are large. We are in hopes that the modernization movement, the salesmanship spirit, the continuous development of co-operation between company and community will bring about the increase in traffic that will assure the increase in net income that makes an enterprise attractive to capital.

American Association News

A Less Serious Side

WHILE the purpose of the Cleveland convention is serious, according to a letter sent out by President R. P. Stevens, there will be entertainment and fun that will make the gathering attractive to the ladies. Cleveland's beautiful Public Auditorium, with its recent additions, is an ideal place for large social affairs, and the entertainment committee is going to take full advantage of its facilities.

There will be special entertainment features, dancing, bridge parties, sightseeing trips and other attractions that will appeal to the wives, daughters, aunts, sisters and children of the delegates. President Stevens hopes that a large number of ladies will be present and that they will get acquainted with one another. The entertainment features serve as an opportunity for this. The contacts thus made are worth more than the expense of going to the convention.

Details of the entertainment program are not yet ready to be announced, but Mr. Stevens in his letter gives assurance that they will be most attractive.

Fiddlers and Trumpeters in Cleveland

SO THAT no well-balanced delegate will entertain the notion that the 1928 convention in Cleveland will be all committee reports, exhibits and educational conferences comes the news that "B. A." will be in Cleveland with his trumpeters and fiddlers. For the benefit of those who do not know "B. A." it should be explained that Mr. B. A. Rolfe is a showman, a business man and superlatively a musician. With his famous Palais d'Or Orchestra he is going to straighten out these always querying and occasionally querulous railway officials on the position of jazz in the music world. To him it's the comedy of music.

At any rate B. A. Rolfe has had an interesting career from the time he was eleven, when he toured Europe as a boy trumpet wonder, to his more recent flings with high-grade vaudeville acts and movies. Even such enticing pursuits produced only a normal pulse so he returned to his old love—Music—and today he ranks with the best of the orchestra leaders of popular music on the concert stage or "over the air."

Subsequent announcement will acquaint convention visitors of the time of his appearance. Don't look for long hair, black tie and other marks of the artistic temperament. He looks like a banker, but he plays the trumpet on a super treble register. There's a secret to that though—perhaps a delegate will pry into it.

B. A. Rolfe and his WEAF orchestra will furnish the music

A.E.R.A. Golf Tournament

MEMBERS of the American Electric Railway Association are all invited to participate in the golf tournament on Sunday, Sept. 23, 1928, in Cleveland, Ohio. This is a special entertainment feature of the 47th annual convention of the association.

The tournament will be played at the Hawthorne Valley Country Club, one of the new scenic golf clubs in the district. Arrangements have been made for starting time from 11 a.m. on, to accommodate as many players as are entered.

The tournament will be eighteen holes medal play and prizes will be awarded to the low gross winner and runner-up, low net winner and runner-up, as well as several others yet to be selected.

Entries should be mailed at once to R. W. Emerson, vice-president Cleveland Railway, Cleveland, Ohio, with the following:

1. Name and address.
2. The club of which you are a member.
3. Club handicap or five lowest scores.
4. Par for the course you play.
5. Other members of your foursome if it is made up.
6. Hotel at which you will stay in Cleveland.
7. Entry fee of $3.

Motor coaches will leave from the Hollenden, Statler, Cleveland and Winton Hotels at 10 a.m., and will take the players to the course, returning after the tournament. The clubhouse is not completed, hence players cannot be serviced either with lockers or food at the course.

News of the Industry

First Move by Detroit Municipal to Make Service Metropolitan

On Sunday, Aug. 19, the Fort Street car line of the Detroit Municipal Railway, Detroit, Mich., was extended to Wyandotte, a suburb of Detroit, approximately 7 miles from the westerly limits of the city.

This extension of service, together with that recently started to Farmington, constitutes the first move in the expansion program to render transportation service to the entire metropolitan area of Detroit.

These extensions have been made possible as a result of negotiations with the Detroit United Railway, which owns that portion of the track beyond the city limits.

Fares are collected under a zone system, there being four distinct zones between the city limits and Wyandotte, with a minimum fare of 10 cents for a ride in any zone, and a through fare of 25 cents for the entire trip.

A through service is maintained over this line at fifteen-minute intervals during the day, with a 7½-minute headway during the morning peak period and a 10½-minute headway during the evening peak.

This through service by railway supplants a bus service formerly rendered by the Detroit United Railway. It is meeting with the whole-hearted approval of the residents of the neighboring municipality.

Revocable Permit Suggested in San Francisco

Samuel Kahn, president of the Market Street Railway, San Francisco, Cal., in a letter to the citizens' transportations committee, says the company will accept proposals to surrender its franchises, some of which have only a short time to run before they mature, to the city in return for revokable operating permits if the city will continue such permits until it is ready to take over the lines. In such an event the company will not claim going concern values in price adjustment. Mr. Kahn's letter follows in part:

A short time after we assumed the management and control of the Market Street Railway we announced publicly that we acquired the property to develop a transportation system second to none in this country. The improvements in service and property, the comfort, care and courtesy of operation and the new features originating under our direction have commanded the attention not only of our patrons but the transportation world as well.

In the brief space of 2½ years we have accomplished much for the car rider, and it is our purpose to continue our policy of improvement. It is for the citizens to say whether or not they want us to continue in this constructive work, for we also announced publicly that if the people of San Francisco wanted the Market Street Railway they could have it at any time, irrespective of franchise expirations, as we believed some mutually satisfactory plan could be evolved toward that end.

It seems to us that the proposed charter amendment is in accord with our promises and, therefore, we have no choice in the matter other than to subscribe to it, and we hereby do so.

Referring to that part of your letter that deals with going concern value, we wish to state that if the proposed charter amendment carries and we take a revocable permit thereunder, we shall make no claim for any such value in the event the city subsequently exercises its right to revoke the permit for the purpose of acquiring our property.

Franchise Committee Named in Jacksonville

At the session of the City Council of Jacksonville, Fla., on Aug. 14 a committee of five members was appointed to confer with representatives of the Jacksonville Traction Company and the city attorney on terms for the proposed new franchise for the company. The committee is headed by Councilman Edward S. Hemphill, vice-president of the Council. Other members are James C. Merrill, Albert E. Barrs, T. S. Adams and W. H. Rowton. Councilman Hemphill is out of the city, and a date for a meeting of the committee with the company representatives and the city attorney will not be set until his return.

Another Move in Columbia Case

Special referee declares railway cannot be compelled to resume service. Hectic controversy dates back to 1922

TO COMPEL the Broad River Power Company, or its subsidiary, the Columbia Railway, Gas & Electric Company, to restore railway service in Columbia, S. C., would violate the fundamental law of the land as declared in both the state and federal constitutions. So declares L. D. Lide, special referee appointed by the Supreme Court of South Carolina, in his report to the court, filed on Aug. 17. The referee recommends to the court that all petitions be dismissed.

The report takes up 70 type-written pages. In it the referee reviews the history of the litigation. The original petition by Attorney General John M. Daniel was filed on July 19, 1927, at which time an order to show cause was issued. Subsequently, pursuant to orders granted at various times, the Railroad Commission, the North Columbia Land Company, the City of Columbia, W. B. Burney, Columbia College, Chicora College, the Columbia School Board and the towns of Eau Claire and Arden were allowed to come into the cause by intervention petitions.

Demurrers to the main petition and the intervention petitions were filed by the power company and returns and answers were filed by them. The petitioners moved to strike out the returns and demurrers and also filed a reply. After the cause had been argued before the Supreme Court upon the pleadings and certain documentary evidence an order was handed down by the Supreme Court, dated Jan. 11, 1928, referring it to Mr. Lide as referee.

The referee ordered a reference for Jan. 25, 1928, but after the order was passed by the referee the Columbia Railway, Gas & Electric Company was adjudicated a bankrupt upon its voluntary petition by order of Judge Ernest F. Cochran, judge of the United States Distirct Court, dated Jan. 24, 1928. On the same day Judge Cochran issued a rule to show cause, temporarily staying the mandamus proceeding.

In compliance with this order the reference was adjourned and on Feb. 2, 1928, Judge Cochran handed down another order continuing the stay, with the stipulation that the petitioners might apply to the Supreme Court for such construction or amendment to the pleadings or might institute such new actions or proceedings as would permit them to

In the industry's interest in national media

Digitized by Google

any of them to proceed against the power companies, other than the alleged bankrupt, for any relief which should not affect the property or railway system of the alleged bankrupt.

Counsel for the petitioners made a motion before the Supreme Court for such amendment or construction of their pleadings. This resulted in an order of the court dated Feb. 17, 1928, in which the referee was directed to proceed under a construction of the action as one for relief against the Broad River Power Company and F. D. Campbell, but "not affecting the Columbia Railway, Gas & Electric Company or its property."

Pursuant to this order a reference was held, lasting for several days. At this reference the petitioners introduced much documentary evidence and a considerable volume of oral testimony. The power companies then offered no testimony, saying that without regard to the various defenses to the merits of the proceedings, the court could not grant a writ of mandamus against them, other than the alleged bankrupt, without infringing upon both the federal court order and the order of the Supreme Court. The referee set March 27, 1928, for argument of counsel before him.

However, the adjudication in bankruptcy was vacated by Judge Cochran on March 13, 1928, upon the ground that it came within the term "railroad corporation" as used in the Bankruptcy Act, filing his opinion on April 2, 1928, dissolving the stay order. The Supreme Court thereupon ordered, April 12, that the parties be authorized to proceed under the original pleadings and proceedings.

Judge Cochran's order vacating the adjudication in bankrupty and revoking the stay order was affirmed by the Circuit Court of Appeals at Richmond, Va., this court's opinion being filed on June 12, 1928. In the meantime the referee ordered another reference which began on May 22.

The report of the referee is not a decision of the case, but is merely a report to the Supreme Court for its information. However, it is thought that Mr. Lide's findings in the matter will bear considerable weight with the court in its deliberations.

The Columbia Street Railway was incorporated by an act of the South Carolina Legislature passed in 1882. The act provided for the franchise to remain in force 30 years, provided the operation be started within five years. On authority from City Council railway operation by horses was begun on the streets of Columbia in 1886, under regulations of Council. Through various consolidations and mergers the company became the Columbia Electric Street Railway on Sept. 13, 1892, and began operating electric cars.

On May 18, 1911, the name was changed to the Columbia Railway, Gas & Electric Company with an increase in capital stock. After 1907, various suburban companies constructed railway lines which were later consolidated with the Columbia Railway, Gas & Electric Company.

In 1922 motormen and conductors went on strike and the operation of cars was suspended for two or three weeks. After the strike the company refused to re-employ the men and refused to recognize the union. The union men organized a "jitney" service. This materially cut into the revenue of the company, but railway service was continued until June, 1926, when several lines were discontinued temporarily under orders by the Railroad Commission. In 1924 the company came under the control of the W. S. Barstow interests and two companies were created: the Broad River Power Company and the original company, the latter retaining the railway property only. The charter for the new company was granted on July 19, 1924.

Continued losses in operations led to various experiments in fares being permitted by the Railroad Commission. Finally the company was authorized to discontinue several more lines temporarily. All orders, the report says, were observed by the company until March 11, 1927, when the entire railway system was discontinued without the authority of the Railroad Commission or any other public body. The commission ordered the company to show cause why it should not be penalized and issued an order March 18, 1927, requiring the restoration of the limited service in effect theretofore.

After a hearing, in which the Carolina Transit Company, a competitive bus company, was also a party, the commission issued an order on April 7, 1927, permitting the discontinuance. The Attorney General filed a petition for a rehearing and the commission reversed its decision on July 28, 1927, and ordered the restoration of service within twenty days.

Following this, numerous resolutions were passed by the City Council. These and the court actions previously reviewed have all featured Columbia's street railway situation. It is expected that a prompt opinion by the Supreme Court will settle finally a trying transportation problem which has lasted since 1922.

Helpful Leads on New Business

"The 57 Big Advantages of Sunset Line Service" is the title of a new twelve-page folder dealing with the co-ordinated rail and motor coach services of the Chicago, Aurora & Elgin Railroad which has been distributed to employees of the company. The new booklet is put up in handy pocket size ($3\frac{1}{2}$x$8\frac{1}{4}$ in.). It conveniently lists the principal talking points which can be used by employees in selling the company's service to the public. Connections with other railroads and points of interest along the line are likewise listed for ready reference. Other information useful to the average employee, acting in the role of salesman, appears under the head of "Helpful Leads on New Business."

Demand Is Made that Kansas Commission Be Abolished

Clyde M. Reed, Republican nominee for Governor of Kansas and former head of the Public Utilities Commission, has met charges that the commission had been a total failure with the suggestion that it be given an additional four years' trial and then abolished if it failed to come up to expectations. He is opposed to the removal of first-class cities from the commission's jurisdiction while that body is in existence.

Peter Witt Loses Gubernatorial Nomination

Peter Witt, former street railway commissioner of Cleveland, Ohio, and inventor of the Peter Witt car, lost his fight for the Democratic nomination for Governor at the Ohio primaries on Aug. 14. Congressman Martin L. Davey, of Kent, who had the indorsement of the Anti-Saloon League, defeated Mr. Witt by approximately 40,000 votes, although in his home county Mr. Witt polled 31,672 votes to Mr. Davey's 2,954. Mr. Witt's principal issue was the one of supporting Alfred E. Smith.

Skip-Stop Plan for St. Louis Defended

The St. Louis Public Service Company, St. Louis, Mo., in advertisements inserted in the St. Louis newspapers, has defended the company's position in insisting upon the continuation of the skip-stop plan of operating its Olive Street divisions between Twelfth Boulevard and Channing Avenue, a distance of 22 blocks.

The ads point out that by eliminating 80 needless stops on various divisions and by the introduction of other time-saving measures the average speed of street cars in St. Louis has been increased during the past four months from 9.4 m.p.h. to 10.1 m.p.h.

St. Louis must be put ahead and not behind other cities, the ad states. It points out that the average speed of cars in Chicago is 11.2 m.p.h.; Cleveland,, 10.5 m.p.h.; Boston, 10.5 m.p.h.; and Washington 10.2 m.p.h. The ad says:

> The average distance between stops in St. Louis is 504 ft., Chicago 660, Cleveland 750, Boston 800 and Washington 660. Years ago the mule-drawn car stopped anywhere to take on a passenger. The desire of the individual determined the policy of the driver. Today the greatest good for the majority must be the only consideration. The selective stop system is one of the principal avenues open for street railways to meet the demand for speed.

When the paving of the widened Olive Street thoroughfare was started weeks ago Director Brooks asked the company to adopt the skip-stop plan as a safety measure and to speed up the construction work. In a recent vote conducted on the street cars 72 per cent of the votes cast were for the skip-stop plan.

Change in Roanoke Fares Allowed

Under an order of the Public Service Commission, all of the changes sought by the Roanoke Railway & Electric Company, Roanoke, Va., have been allowed, with three minor modifications. The most important of these was to make the second fare zone extend between Fairview and Lakeside, instead of between Fairview and Edgewood, as requested by the company.

Zone one includes all lines in Vinton and Roanoke and its suburbs east of Fairview, and zone three from Lakeside to and including Salem.

The 7-cent fare or a token, four of which will be sold for 25 cents, permits one continuous ride between any two points in zone one, with free transfer within the zone when necessary.

The commission has also authorized the company to issue a $1 transferable pass, entitling the holder to unlimited transportation in zone one for a period of seven consecutive days, beginning midnight every Sunday.

A book of twelve tickets will be sold for $1.50, under the commission's order, and will entitle any member of one family to ride between Roanoke or Vinton and Salem. It will be good until used. Round-trip tickets will be sold for 35 cents, and will entitle the holder to continuous rides each way on through cars running between Roanoke or Vinton and Salem.

No Concession to Tacoma Municipal Employees

The City Council of Tacoma, Wash., has approved the recommendation of Commissioner Ira S. Davisson that the request of municipal belt line employees for a monthly basis of pay be refused. The commissioner reasoned that the change would mean a material increase in the cost of operating the line. The Council has turned over to the commissioner a request from the Tacoma school board that it be allowed to contract with the city for transportation of children from northeast Tacoma on the same terms as last year. It is stated the school children were carried at a loss last year. Transportation was by bus on the hill to connect with the railway across the tideflats.

Helping the Boys to Help Themselves

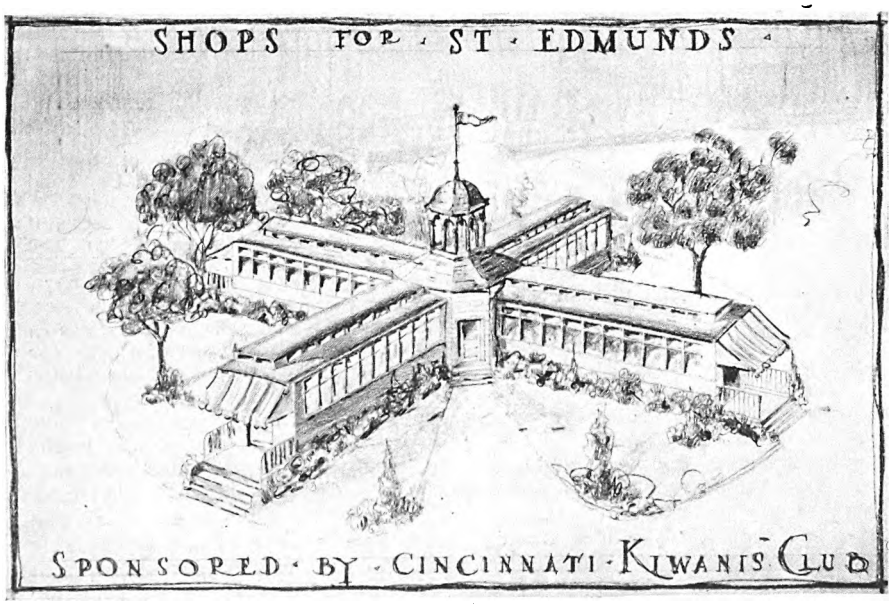
A suggestion to other electric railways is offered in the plan to convert four cars of the Cincinnati Street Railway, Cincinnati, Ohio, into a machine shop and industrial school for the boys of St. Edmund's School, at Glendale, made by the members of the Kiwanis Club of Cincinnati.

As indicated in ELECTRIC RAILWAY JOURNAL for Aug. 11, page 234, the cars are to be hauled to the Glendale site by members of the Kiwanis, who will make a holiday in which to volunteer for service in mounting them upon concrete pedestals and fitting them up in the form of a Maltese cross, with an attractive cupola in the center.

Eric Gibberd, formerly advertising manager for Mablew & Carew, who gave up a career as an advertising man to devote his life to 33 under-privileged boys ranging from ten to sixteen years of age, is a member of the Kiwanis Club and the club sponsored the plan to build the machine shop as a testimonial to the worth of their fellow member.

The converted cars will make a building 70 ft. through the center and 8 ft. wide. One of the cars is to be turned into a woodwork room; another into a metal machine shop; another into a clay modeling and electric shop, and the fourth will be used as a school room in which members of the Kiwanis Club and others will instruct the boys in useful trades.

The longitudinal seats of the cars will be converted into work benches. Members of the club will donate machinery, tools and equipment.



Drawing showing plan for boy's paradise at Cincinnati

New Bills Being Drafted in Chicago

Drafting of an entire new set of legislative bills to facilitate settlement of the local transportation problem in Chicago was ordered recently by the transit sub-committee of the Chicago City Council. The proposed measures, which will include two or three alternative plans, will be drawn up by Assistant Corporation Counsel John G. Drennan.

The new bills are to include a home-rule measure, a terminable permit bill and an amendment to the present Mueller law to permit the city to buy local transportation lines which might extend their service beyond the city limits. At present, the city has only the right to purchase lines operated wholly within the city. Two separate propositions will be offered in the home-rule bills which Mr. Drennan is to prepare, one creating a metropolitan transit commission with jurisdiction over all the local transportation systems in Cook County. The other will provide for a commission having regulatory powers over only those lines which the city will have the right to purchase under the proposed ordinance.

No bill authorizing the consolidation of the local transit systems—a plan around which previous legislative traction programs have been built—is to be drawn until the matter is agreed upon between the sub-committee and representatives of the several companies.

New Fares in East Cleveland Protested

The recent award by a board of arbitration of a 9-cent fare to the Cleveland Railway in East Cleveland, Ohio, has been attacked in a suit filed by an East Cleveland citizen based on the ground that the East Cleveland commission did not have the right to delegate the fixing of a rate of fare to a board of arbitrators, as provided in the East Cleveland franchise.

The Cleveland Railway is expected to contest the suit on the ground that the original East Cleveland franchise ordinance, providing for a revision of fare every five years, was ratified by the people at a referendum vote and that no objection was made to the arbitration clause of the franchise at the last five-year revision period in 1923.

The East Cleveland fare is based on a differential above the Cleveland rate, the differential rising or falling as the Cleveland rate changes. The differential at the present Cleveland rate is 2 cents.

Cleveland Heights, another suburb of Cleveland, has been dickering for several years for a new franchise embodying extensions. The Heights officials about a year ago agreed to a 1-cent differential, but the Cleveland Council refused to ratify the franchise. It is reported now that the Heights Council will agree soon to the same differential in effect in East Cleveland. This will put all large suburbs of Cleveland, except Lakewood, on a service-at-cost basis.

Electric Coach Tried in Salt Lake City

Citizens of Salt Lake City received their first glimpse of one of the ten new electric coaches soon to be placed in regular service by the Utah Light & Traction Company, when a trial run was made on the afternoon of Aug. 20. Governor George Dern of the state of Utah, Mayor John F. Bowman of Salt Lake City, and a number of other state and city officials, together with directors and officers of the railway and members of the Salt Lake City Chamber of Commerce were passengers on the initial trip. The proposed route of the new electric coaches, known as the Fourth East line, was fully traversed. The trial was very successful, according to those who rode in the coach, and demonstrated the practicability of the new type of vehicle.

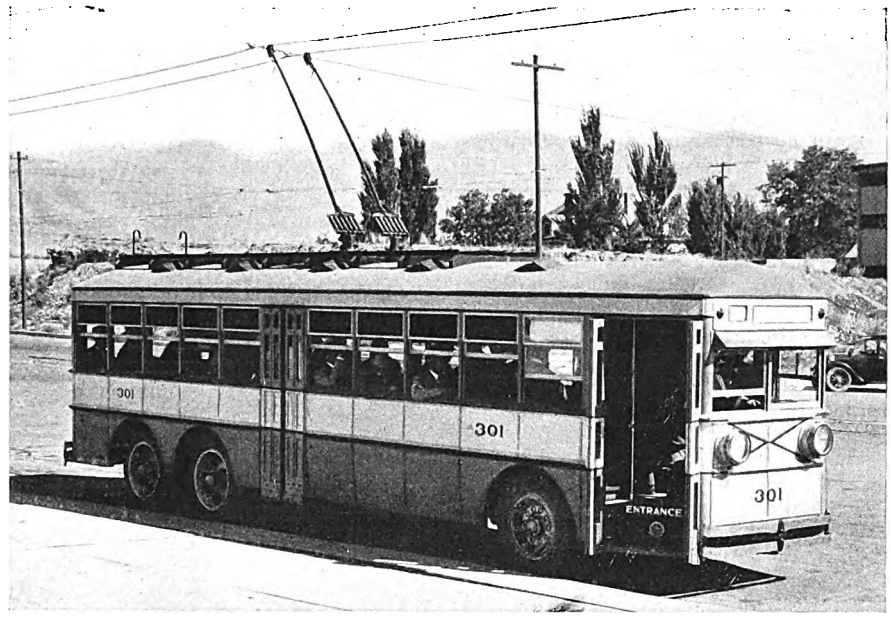
Regular operation on the line, which extends north on Fourth East from Twenty-first South to Seventh South through a residential section, west on Seventh South to Main Street, north on Main Street to Second North through the heart of the business section, and then east on Second North to the state capitol through another residential section, will be started early in September, it is expected. The ten coaches were manufactured by the Versare Corporation, Albany, N. Y.

Air-Interurban Travel Popular

During the first two months of operation a large number of Ohioans have taken advantage of the experiment in the co-ordination of electric railway and airplane service. This innovation was undertaken by the Cleveland Southwestern Railway & Light Company, which operates interurban service from Mansfield and other cities to Cleveland. As explained previously in ELECTRIC RAILWAY JOURNAL tickets are sold by the electric railway which provide for a fast ride on one of the company's de luxe cars to the Cleveland airport. There immediate connections are made with a tri-motor plane service to Detroit. This enables persons living along the company's lines to leave their homes in the morning, travel to Cleveland by interurban and to Detroit by air, and return in the same manner on the same day.

City to Re-lay Rails After Completing Poughkeepsie Sewer

Agreement has been reached between the Poughkeepsie City & Wappingers Falls Electric Railway, Poughkeepsie, N. Y., and the Common Council by which the city agrees to pay the cost of relaying the rails in Market Street after the new sewer is installed. The plan to take the rails out of Market Street and suspend service a month while a new sewer is laid preliminary to paving was agreed upon only after long negotiations between city officials and representatives of the company. It was found that service must be suspended to lay the sewer which goes down in the center of the street.



State, city and railway officials were passengers on the trial run of the first of the Salt Lake City electric coaches

Next Step in Los Angeles Terminal Plan

The Interstate Commerce Commission made public recently its decision on the hearing held several months ago at Washington, D. C., concerning the building of a union station at the Plaza site, in Los Angeles, Cal., or any other location. Under the existing laws, the commission said it was not empowered to require the construction of a union passenger station of the character sought by the city of Los Angeles. This decision marks the commission's final action in the case.

In 1916 the Railroad Commission approved and ordered the construction of a terminal on the Plaza site. The railroads contended that the state body did not possess authority to order interstate carriers to provide terminal facilities. The carriers contended that if authority was vested in any governing body, the Interstate Commerce Commission, and not the state authorities, was empowered so to command. Later the case was taken to the United States Supreme Court, which upheld the ruling of the State Supreme Court that the Interstate Commerce Commission should pass upon the unification plan.

The railroads have long insisted that the best interests of the public and the carriers will not be served by a union station at the Plaza due to the fact that Los Angeles is not a connecting or transfer point for passengers. The carriers have expressed themselves as ready and willing to carry out a plan of enlarging the Southern Pacific Station, building a new one on the present Santa Fe Station site, eliminating crossings at grade, and for the Pacific Electric Railway to construct an elevated to serve points north, east, and south.

Under the Schuylkill to West Philadelphia

Mayor Mackey of Philadelphia has ordered the drafting of tentative plans for a four-track tunnel under the Schuylkill River from 22nd and Market Streets westward to 46th Street. The work will be preliminary to the transit development of West Philadelphia, which will be a part of the Pennsylvania Railroad's new station plans.

One or more tunnels under the Schuylkill are regarded as essential parts of the citys high-speed rapid-transit program. One must carry the Locust Street surface-car subway to West Philadelphia, and another is planned as part of the Pennsylvania Railroads terminal improvements. When these plans were first outlined it was intended merely to remove the present elevated structure on Market Street to a position within the lines of the terminal station, but the awkwardness of this expedient soon became manifest and the proposal to carry the line under the river instead of over it, as at present, has commanded general approval.

In Mayor Mackey's instructions to the city engineers to draft plans for this change, the extension of the proposed P. R. T. subway under Market Street as far west as 46th Street is indicated. This goes further than has been contemplated in any previous discussions of the program. As the Philadelphia *Ledger* puts it, the present proposal will add materially to the cost, and naturally raises the query as to how the cost is going to be met. As the change is primarily to benefit the public, it would be unreasonable to look to the P. R. T. to bear all the burden, but as that company would also be the gainer by the change, the *Ledger* regards it as important that all uncertainty on the subject shall be removed before the city is committed too deeply to the undertaking. Its concern on these grounds has found reflection also from other sources.

Coral Gables Cars Operated by Miami Beach Railway

Operation of the West Flagler Street car line to Coral Gables was started recently by the Miami Beach Railway, Miami, Fla., which now is operating it as part of the Miami system. A 5-cent fare is in effect to the end of the line at Ponce de Leon Boulevard. The service is operated every twenty minutes in both directions. Cars have a special sign reading "West Flagler Street to 36th Avenue." The city of Coral Gables, which owns the railway system in that place, now operates the cars from West 22nd Avenue in Ponce de Leon Boulevard to Coral Way.
